CHICAGO SUPPLEMENT.

GRACELAND.

Mr. Robinson, in his book entitled *The Parks and Gardens of Paris*, says that the Americans are the only people who bury their dead decently and beautifully.

To Mr. Strauch the beauty of modern cemeteries is largely due. The Western cities are especially fortunate from the fact that they were brought more directly under Mr. Strauch's influence, and perhaps this influence is shown in no place more fully than at Graceland Cemetery in Chicago. This cemetery is of especial interest to lovers of trees and park-like effects, on account of its showing what can be done in a few years on land originally destitute of trees and natural beauty. The banks of the lakes have been quite largely planted with native trees and shrubs that have been brought from the outlying country districts. The red dog-wood has proven itself particularly useful, giving charming effects of color in winter as well as in summer. A great variety of trees have been planted, ranging in size from the smallest seedling to an elm reaching sixty feet in height, and with branches spreading the same distance. This tree is nearly two and one-half feet in diameter, and was moved in an upright position, together with another elm six feet in circumference. We have yet to hear of a larger tree-moving operation than this. The chapel and receiving tomb in Graceland should be visited by all who are interested in buildings of this character. The former is what is known as a conservatory chapel, and although the idea of using decorative plants in cemetery chapels is not new, we believe that it has nowhere been carried out so successfully as at Graceland. In the character of its monuments this cemetery ranks favorably with the many beautiful cemeteries to be found near our larger cities.

GRACELAND CEMETERY.

E. L. CORTHELL,

Office 205 La Salle Street, has been engaged in the construction of railroads, bridges, dikes, and harbor improvements, notably the bridges over the Mississippi River at Hannibal and Louisiana, Mo. He was associated with the late James B. Eads in building the jetties at the mouth of the Mississippi River, and he published a history of e jetties, which is recognized as authority on t subject. He was chief engineer on the con of the N. Y., W. S. and B. Ry. between rk and Buffalo. He again joined Mr. his still greater work of a ship-railway the American Isthmus in Mexico. He is il engaged on this work as the chief engineer, d a director of the company.

During a partnership of two years he and Mr. rge S. Morison built the following bridges: Sioux City, over the Missouri River, for the M. and N. Ry.; at Nebraska City, over the ssouri, for the C., B. and Q.; two large bridges regon and Washington; and the Cairo Bridge, e the Ohio, for the Illinois Central. They were engaged in the examination of railway prop e and projects, and a variety of engineering k, as professional engineers, Mr. Corthell giving special attention to harbor and waterway improvements. He is now chief engineer of the Merchants' Bridge over the Mississippi at St. Louis. He has for two years acted as consulting engineer of the C., M. and N., and the A., T. and S. F. railroads, in enlarging their terminals in this city. He is chief engineer of the jetties at the mouth of the Brazos River, Texas. He has examined and made plans for the harbor improvements at Tampico, Mexico, for the Mexican Central Railroad. He has been engaged in making surveys, plans, and estimates for a terminal railway and bridge over the Mississippi at New Orleans. Also for the inside waterway along the east coast of Florida, from St. Augustine to Biscayne Bay.

Mr. Corthell is vice-president of the American Society of Civil Engineers, president of the Western Society, member of the Philadelphia and Boston societies, of the Institution of Civil Engineers of Great Britain, of the French Society of Civil Engineers, and is a Fellow of the American Association for the Advancement of Science. He is now chairman of the Civil and Mechanical Engineers' Committee of the World's Fair.

GEO. S. MORISON,

whose New York office is at 35 Wall Street, has his head-quarters in Chicago in the Rookery. He has, as chief engineer, designed and constructed the Plattsmouth, Bismarck, Blair, Rulo, Omaha, Nebraska City, and Sioux City bridges across the Missouri River, and the bridge across the Ohio at Cairo, Illinois. He is now, as chief engineer, constructing the bridge across the Mississippi at Memphis, besides other important works at various places from Oregon to Florida.

SAMUEL G. ARTINGSTALL, C.E.,

Mem. Am. Soc. of C. E., Asso. Mem. I. of C. E., past pres. W. S. of C. E., 20 Rialto Building, has been employed in the engineering department of the city from 1869 until 1888, and for several years, as chief engineer in this capacity, he has designed and had charge of the construction of all bridges and viaducts in the city, and has superintended the construction of the West Side Water-works, the additions to the North Side Works, and designed the extension of the works, including the tunnel now being built four miles under Lake Michigan, with inlet cribs, etc., and is still connected with this work. He is engaged in general engineering practice, and is now rebuilding and lowering Washington Street Tunnel, and building the tunnel under the river near Van Buren Street which will pass under a number of large and important buildings, and is one of the most difficult pieces of work now in progress in the city. Is engineer for tunnel five thousand feet long under Lake Michigan, in Lake View. He is also building several bridges and viaducts in this city and elsewhere.

THE FITZ SIMONS & CONNELL CO.

Charles Fitz Simons, President of the contracting corporation of Fitz Simons & Connell, comes from the Empire State of New York. In 1866, shortly after the war, he was associated with the engineering and constructing firm of Ledlie, Corse & Co. Upon the retirement of this firm, which completed a large number of the bridges on the Union Pacific Railroad, the Fitz Simons & Connell Co. took up the same line of business, and has, in a satisfactory manner, constructed many of our most difficult public works, among which may be mentioned the Fullerton Avenue Conduit, the protection to the Water-works Crib, the Shore Inlet Crib, some three thousand feet of the Lincoln Park Breakwater, also the substructure for all of our double track bridges built thus far. They are at present engaged on the outer four-mile crib, one of the largest, if not the very largest, works of its kind in the world. The rebuilding of the La Salle Street Tunnel is another of the difficult and extensive works this company is engaged on, in addition to their regular operations in dredging and dock-building.

JOHN A. COLE, C.E.,

69 Ashland Block, Municipal and Sanitary Engineering. A student in the office of Thomas Doane, C. E., of Boston, 1857-60; afterward, for two years, in hydraulic work in Massachusetts. During the war directed the expenditure of over three millions of dollars in the Army of the Potomac and the Army of the James as General Field Agent, U. S. C. C. Located in Chicago in 1872. Has constructed and designed systems of sewerage and water-works in many cities in the United States and Canada. Has made a large number of reports, as expert, upon properties of corporations, gas-works, water-works, city railways, etc., aggregating many millions of dollars, within the past two years.

BENEZETTE WILLIAMS.

The works most affecting the health and comfort of the general public which it devolves upon engineers to execute are those belonging to hydraulic engineering, inclusive of sewerage and water supply. In this branch, Benezette Williams, 171 La Salle Street, is widely and favorably known. He began his professional career with a training among the best offered by the engineering schools of the country, and after serving in a subordinate capacity for some years, held in turn the office of Engineer of Sewerage and City Engineer of Chicago, and has since designed and executed many systems of sewerage and water-works throughout the country, including those of Pullman.

He was also a member of the Commission which recommended the drainage project, which has been embodied in an act creating the Chicago Sanitary District, and is now engaged to design and construct water-works for Seattle, Washington.

He is a member, and past president, of the Western Society of Engineers, and is Chairman of the Association of Engineering Societies.

M. E. SCHMIDT.

The phenomenal growth of Chicago has induced this well-known civil engineer to establish himself quite recently at 1138 the Rookery Building. In attending to the engineering and contracting for all classes of public works in this city and other parts of the United States, Mr. Schmidt will be associated with the best talent that can be procured, and give special attention to exposition matters, drainage, rapid transit, the construction and examination of railways, and the improvement of rivers and harbors. He will also investigate projects in Mexico, Central and South America. Mr. Schmidt was chief assistant engineer of Captain Eads's famous jetties at the mouth of the Mississippi, and has since constructed in Mexico one of the most difficult railways on the American continent.

WADE & PURDY,

Civil and Mechanical Engineers, are making a specialty of iron and steel construction in buildings. Mr. Wade has designed and erected several large ones in Milwaukee and Kansas City. Mr. Purdy was formerly connected with Eastern mills and shops. They designed the iron-work for Rand & McNally's and Caxton buildings, Chicago, also designed the power plant of Denver Tram-way Company. Both are members of Western Society of Engineers, and of American Society of Civil Engineers. They designed and built the Union Avenue station for the Kansas City Cable Company, have large experience in their line, and have bright prospects at this time for extensive contracts. Mr. Purdy was formerly City Engineer of Eau Claire, Wis., and for some years connected with C., M., and St. P. Railway.

GENERAL WM. SOOY SMITH.

One of the most experienced and distinguished is General Wm. Sooy Smith; office, 632 Rookery. Born at Tarlton, Ohio, in 1830, he was graduated at the Ohio University, and afterward at West Point. He came to Chicago in 1854, and at once became engaged in designing and constructing many bold and difficult engineering works, such as great bridges, tunnels, light-houses, and all kinds of hazardous under-water work. He has invented and successfully applied many new and valuable processes and devices for doing such works, and he and his son are now introducing the freezing process for consolidating quicksand and other soft materials, making it practicable to work in these materials as easily and safely as if they were solid rock. *He built the first bridge of steel, and proved its superiority over all other materials for bridge building.* In the fulness of his professional reputation, he is still engaged in carrying out many great undertakings and works with unabated energy.

E. LEE HEIDENREICH & CO.,

99-101 Metropolitan Block, Chicago. This enterprising firm of Consulting Engineers and Contractors make the planning and erection of grain elevators their specialty, and comprise the only concern in Chicago building farmers' or railway station elevators (of capacities from 10,000 bushels upwards). They not only confine themselves to elevators in this country, but have furnished plans and special machinery for elevators in foreign countries, especially Russia. Among elevators built by the firm this season are: for Duane & Co., and Chas. Patrick, at Macomb, Ill., S. W. Allerton, at Galesville, Ill., all of 25,000 bushels, Heidenreich system; and for W. C. Fuhrer & Co., Mount Vernon, Ind., a 75,000 bushels cleaning-elevator. They are now building a 200,000 bushels cleaning house for Chas. Counselman & Co., Chicago, and another of 75,000 bushels for the Rock Island road at Kansas City, Mo.

CHARLES L. STROBEL,

205 La Salle Street, is chief engineer of the Keystone Bridge Company, one of the oldest and largest bridge-building establishments in the country, and consulting engineer of Carnegie, Phipps & Co. (Ld.), and of Carnegie Bros. & Co. (Ld.). The former of these two firms are the leading manufacturers of iron and steel constructional material, and the latter are the well-known manufacturers of steel rails. All three are Pittsburg concerns, and the importance of Chicago is well illustrated by the fact that these large establishments have their principal engineering representative a resident of the latter city. Mr. Strobel is a past director of the American Society of Civil Engineers, and a member of the Institution of Civil Engineers of Great Britain, and other engineer societies.

SINESS BUILDINGS IN CHICAGO.

THE GREELEY-CARLSON COMPANY,

Room 834, Opera House Block, is widely known as city and county surveyors. The foundation of their business was laid in 1851 by Mr. Samuel S. Greeley. In 1862 the firm of S. S. Greeley & Co. was organized, who were succeeded in 1881 by Greeley, Carlson & Co., and in March, 1887, the Greeley-Carlson Co. was incorporated, with the following officers: pres., Samuel S. Greeley; vice-pres., Frederick Greeley; treas., Gustaf H. Carlson; sec'y, Sylvester K. Howard. This company make a specialty of land work, and execute the largest percentage of all the work performed in this line in the city. Special reference should be made to their work in the erection of the new Board of Trade building, the Home Insurance building, the new Chicago Auditorium building, the Palmer House, and the Grand Pacific Hotel. They have also recently published an atlas of Chicago, showing every lot, block, street, alley, railroad, and dock within the city limits, and giving full dimensions and position, and have also for sale their valuable atlases and maps of Hyde Park, Evanston, Lake, and other suburban towns. Mr. S. S. Greeley was born in the city of Boston, and came to Chicago thirty-five years ago. He has had a practical experience of forty years as a surveyor, is a member of the Northwestern Society of Engineers, and pre-eminent in his profession in this section of the country

GEORGE A. FULLER,

Room 1123 Rookery Building, one of the largest contractors and builders in the city. During the past seven years Mr. Fuller has built some of the largest and most perfect of Chicago's large buildings. The Tacoma, the Caxton, the Pontiac, the Rand & McNally, and the Monadnock are of his construction, and have cost an outlay of three and a half millions of dollars. One of his largest and most unique creations is the Monadnock, which is of steel construction, seventeen stories in height, requiring about six thousand tons of steel, and which will be the largest office building in the world.

E. F. GOBEL,

Mason, Builder, and General Contractor, 179 Washington Street, makes a specialty of Government work, and is engaged on the Custom-house in Minneapolis and the Chicago Post-office.

CONRAD SEIPP BREWING CO.

On five acres of land at the foot of Twenty-seventh Street, overlooking Lake Michigan, is located the plant of the Conrad Seipp Brewing Co., incorporated in 1876—Conrad Seipp, President; William C. Seipp, Vice-president; T. J. Lefens, Secretary, and L. A. Orb, Manager, and Superintendent of the West Side Brewery, located at Paulina and Augusta streets. These two form one of the largest and most perfectly appointed plants in the country, brewing during 1889 over three hundred thousand barrels of beer.

The Conrad Seipp Salvator Export has more than a national reputation, and for a light beer none is equal to their Extra Pale Pilsener. During the past year the company has placed on the market a new brand, called Muenchner Hof Brau, which has become popular throughout the West.

The company employs 300 hands in the breweries, malt-houses, and elevators.

THE WACKER & BIRK BREWING CO.,

from Nos. 161 to 181 N. Desplaines Street, is one of the largest in Chicago.

Away back in 1854 there arrived in Chicago from Germany Mr. Jacob Birk, who had become a master of the art of brewing in the father-land. Associating himself with Mr Frederick Wacker, the firm of Wacker & Birk was established, and their brand of beer soon became widely known. In 1882 the business had outgrown all its old bounds, and it was decided to incorporate it as a company under the laws of the State of Illinois, the incorporators being Mr. Frederick Wacker, who has since died, Mr. Jacob Birk, and Mr. Charles H. Wacker.

Mr. Charles H. Wacker is a native Chicagoan, being born in this city some thirty three years ago. From year to year since 1882 new buildings have been added to the plant. The elevators have a frontage of 150 feet on Indiana Street, and the malt-houses a frontage of 330 feet on N. Jefferson Street. From the twenty-five thousand barrels of beer sold in 1882, the output has run up to ninety thousand barrels in the past year.

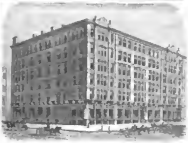
A. BOOTH PACKING COMPANY.

"The largest shippers by express in the world." —*Chicago Herald.*

"Largest packers of oysters, fish, and canned goods in America."—*New York World.*

This world-famed establishment was started in Chicago in 1859 by Mr. Alfred Booth, with a capital of a very few dollars and with the aid of a single assistant, while to-day it has twenty-one branch houses, extending from Baltimore to Astoria, Oregon, and from Duluth to New Orleans; has in its employ five thousand men, in addition to those engaged in manning its fleet of boats on the Atlantic and Pacific oceans, Gulf of Mexico, and Lakes Michigan and Superior, employing a capital of over a million dollars. The immense oyster and shrimp packing-houses at New Orleans, with the extensive salmon canneries on the Columbia River, Oregon, and the mammoth oyster, fruit, and vegetable packing-houses in Baltimore, verify the newspaper expressions quoted above. The sales of the "Oval" brand of fresh oysters packed by this company exceed those of any other five brands in the United States; and equally in demand are its celebrated "Oval" brand of peaches, pears, salmon, shrimp, and Cove oysters, the "Black Diamond" brand of salmon and Cove oysters, and the "Old Honesty" brand of Cove oysters.

C. M. HENDERSON & CO.
NEW FACTORY AT DIXON ILL.



C. M. HENDERSON & CO.,

Extensive boot and shoe manufacturers. The above cut represents one of their three Western factories and their distributing warehouse and salesroom in Chicago. They have achieved a wonderful record on their "Red School-house" shoe for children; their $2.50 shoe for ladies, and a men's custom-made fine calf shoe, to retail at $3.00, in connection with other meritorious lines manufactured by them.

LOCKWOOD & KIMBALL

Make a specialty of American and English enamelled brick, which is in such demand, not only for ornamental purposes, but for the building of courts of large buildings.

The yards and warehouses are at Twenty-fifth Street, on the Lake, and directly on the line of the Illinois Central, Michigan Central, and Baltimore and Ohio railways, thus having direct connection with all sections of the country.

This firm was established in 1864, and represents the largest of pressed brick manufacturers, including the hydraulic pressed brick companies of St. Louis, Collinsville, and Findlay, Ohio, of whose output they make a specialty, and of which they have sold ten millions in the past few months.

THE COLD BLAST FEATHER CO

Very few know, when they lay their head on the soft downy pillow at night, that they are indebted for the luxury to the Cold Blast Feather Co. of Chicago, whose plant extends from 56 to 66 West Van Buren Street, which is one of the largest in America. The Cold Blast Feather Co. are manufacturers and dealers in all bedding supplies from excelsior to eider-down.

The company was established in 1882, and incorporated under the laws of the State of Illinois in 1884, with Louis H. Everts, President, and Edward A. Everts, Secretary and Treasurer.

ELLIOTT MAHON & CO.

Prominent among the dealers in Chicago real estate is the firm of Elliott Mahon & Co., whose office is Room 42, 130 Dearborn Street. This firm offers to investors a choice line of mortgage loans bearing 6% interest. They make a specialty of placing non-resident money, and acting as trustees of the investment.

NELSON MORRIS & COMPANY.

In the issue of November 9th, 1889, the canned beef product of the above house was incorrectly stated, and should have read: "The canned beef product of the firm, of which 7,343,000 cans, each weighing from four to ten pounds, was the record last year, is shipped everywhere, and this year will reach approximately 1,000,000 cans a month," etc.

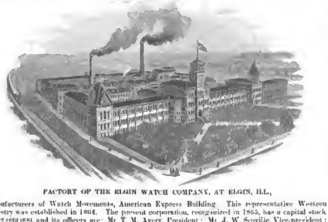
THE CHICAGO ARC LIGHT AND POWER CO.

President, R. E. Sonny; Vice-president, Columbus R. Cummings; Secretary and Treasurer, C. H. Wilmerding. Capital, $1,000,000

This company is operating over 2000 horse-power of electrical machinery, furnishing 1900 commercial arc-lights, 1000 incandescents, and about 125 horse-power to electric motors. It is distinguished for being the first electric light company to cope with and to solve the difficult problem of carrying high tension currents underground. It is operating successfully over fifty circuits, at a potential of 2500 volts, some as much as seven miles in length and underground throughout. The three Compound Condensing Williams Engines, of 500 horse power each, at its Market Street Station have made the reputation of their designer, and are considered to be unsurpassed for electric-light work. A novel feature is the use of rope instead of belting throughout the station for the transmission of power, manilla being used on the large engines, and rawhide from the driving pulleys to the dynamos. The company uses and controls the conduits of the Chicago Sectional Electric Underground Co., containing nearly a hundred miles of duct, distributing from these main conduits by means of laterals to the excavated space under sidewalks. The electrical equipment is composed principally of Thomson-Houston apparatus, though the Ball, the Western Electric, and the Schuyler systems are also represented. It is an evidence of the growth and increase in Chicago's business that this company has within the past three months added 300 arc-lamps on its circuits in the commercial districts.

SPAULDING & CO.,

corner of State and Madison streets, Chicago, can now claim the largest and most thoroughly equipped jewelry house in America. Spaulding & Co., of Paris and New York, are now of Chicago, and their new home is second to none in the world. Gems, with not alone worth but historic interest; the rarest of bronzes; the creations of Jurgensen and Patek, Phillippe & Co.; Royal Worcester, Dresden, Sevres, Doulton, and Crown Derby Porcelains, are displayed in profusion, making this the rarest display in the West.



FACTORY OF THE ELGIN WATCH COMPANY, AT ELGIN, ILL.,

Manufacturers of Watch Movements, American Express Building. This representative Western industry was established in 1864. The present corporation, reorganized in 1865, has a capital stock of $2,000,000, and its officers are: Mr. T. M. Avery, President; Mr. J. W. Scoville, Vice-president; Mr. William G. Prall, Secretary; Mr. George Hunter, Superintendent of Works. The celebrated trade-mark goods of this company are the "B. W. Raymond," "H. H. Taylor," and the "G. M. Wheeler" movements. All other movements bear the name of the "Elgin National Watch Company." The Chicago general agency occupies an elegant suite of rooms, where President Avery and Mr John M. Cutter, the General Agent, make their head-quarters. The company started out on a capital stock of $100,000, and the business has grown so rapidly as to distance all competitors. They sell only to the wholesale trade, and do an annual business of $3,000,000. Their works cover a superficial area of 175,000 feet, with a frontage of 552 feet, and a depth of 427 feet; employ 2700 hands, and turn out 2000 complete watch movements in forty-five different styles daily. The buildings are fitted up with every modern appliance and with finer machinery than any watch factory in the world, while its tools and general mechanism are wholly unsurpassed.

WILLIAM DEERING & CO.

The son of the pioneer who swung the cradle and scythe now drives his team afield, and with one of the reliable Deering binders or mowers accomplishes in a few hours what it would have taken his hardy ancestor days or even weeks to perform.

A few years ago binding grain by hand seemed to be a necessary feature of harvesting. To-day it is almost a primitive custom—a subject for the poet or painter. No greater revolution ever took place in farming than was effected when William Deering & Co. brought out the first successful twine binder. As they had been the first to introduce and popularize the hand-binding of grain on tables, and afterward the automatic binding of grain with wire, so in 1880 their twine self-binder was welcomed as the greatest triumph in the annals of harvesting machinery. In 1888 the substitution of steel for wood in this machine created a new departure in harvester building, and but strengthened the already admitted position of William Deering & Co. as the leaders in the manufacture of binders as well as of mowers, reapers, and binder twine.

A large measure of this firm's success is due to the fact that they make their own knives, castings, bolts, rivets, etc., and use only the best material procurable. They likewise own and operate a large twine factory, and in this respect stand alone among binder concerns. Of malleable and gray iron castings alone over 16,000 tons are annually produced by them and used in their machines. Less than thirty years ago the works consisted of a small two-story frame building located in an obscure Illinois town. From the date of their removal to Chicago, in 1880, they have been yearly spreading over a wider area until the buildings and lumber yards embraced in the present plant occupy fully forty acres of ground, and constitute the best equipped establishment of its kind in the world, employing 3000 workmen. Over 4000 agents are kept busy selling and distributing Deering machines in every quarter of the globe.

HALLOWELL-BODWELL GRANITE CO.'S.

The late Governor Bodwell, of Maine, president of the above-named companies, observing the rapid growth of Chicago, foreseeing the undoubted certainty of a great building era there, and believing that granite as a building material would not only find favor with Western architects and owners, but would ultimately be in demand, established an office in this city some seven years ago, under the management of Mr. George F Bodwell. The naming of the following structures erected by these firms in their material is proof that the people of Chicago have taken a stand on a par with those of Eastern cities in the selection of material for their finest buildings, and shows the energy and enterprise of the above-named firms. Their first contract was for the new Board of Trade Building. other office buildings followed this, viz., the Pullman, Counselman, Gaff, Home Insurance, and the Auditorium, Chicago; the Northwestern Mutual Life, Milwaukee; the Batavian Bank, La Crosse, Wis.; Iowa Loan and Trust Building, Des Moines, Iowa, and the Le Clede Bank, St. Louis, Mo.

The residence of Harlow N. Higinbotham, Esq., designed by Burling & Whitehouse, is constructed outside entirely of the Hallowell white granite, finely dressed and ornately carved, the clear, even white color of the stone harmonizing with the quiet dignity of the design. A little north of this, in process of erection, is a residence for R. T. Crane, Esq., of this same granite, Charles S. Frost, architect. One of the handsomest houses on the Lake Shore drive is that belonging to Major S. E. Barrett. W. L. B. Jenny, architect, desiring a light material for the exterior, regardless of cost, both the owner and architect gave the subject thorough investigation, and selected the Hallowell white granite.

P. F. PETTIBONE & CO.

(Successors to Brown, Pettibone & Co.), Wholesale and Retail Stationers, Printers, and Blank-book Manufacturers. Established in 1881 by men of long business experience in the stationery trade, the business soon attained a prominent position, and has experienced a steady and healthy growth. It occupies the four-story and basement double front building 80 and 82 Adams Street. The large and well-lighted salesroom on the first floor is well stocked with staple counting-house stationery. On the upper floors are the manufacturing departments, the chief of which are the printing-office and blank-book bindery. They give special attention to city demands, and are glad to open accounts with small as well as large consumers. "All stationery and printing supplies for operating or advertising a business" fairly defines the character and scope of their trade. They have a large trade with banks throughout the West, and an extensive trade in records, blanks, etc., with county and other public offices. They are the only Chicago manufacturers of the celebrated Philadelphia Flexible Back Blank-books.

CHICAGO UNION LIME WORKS.

For the past twenty-five years Mr. F. E. Spooner has been Agent and Manager of the Chicago Union Lime Works, whose quarries and works are located at Lincoln and Nineteenth streets, occupying eighteen acres of ground. This is one of the largest plants in the country, and its products of lime and crushed stone are standard goods and universally known. The business was established in 1859, and is owned by T. W. Phinney. The company's output of lime per month is fifty thousand barrels.

INTERESTING PAPERS.

A RUSSIAN GENERAL
Contributes an exhaustive paper on "The Russian Army," illustrated from sixteen drawings by T. de Thulstrup.
HOWARD PYLE
Writes and illustrates "Jamaica, New and Old" (first paper).
ANDREW LANG AND JOSEPH PENNELL
Contribute, the one a description, the other illustrations, of "St. Andrews."

THE STORIES.

LAFCADIO HEARN
Begins a short serial, "Youma." Illustrated by Howard Pyle.
ELIZABETH STODDARD
Tells the story of "Polly Dossett's Rule."
KATHARINE S. MACQUOID
Tells the story of an inexplicable ghost. Illustrated by H. M. Paget.
M. E. M. DAVIS
Tells a story of the New South, entitled "The Centre Figger."
HON. CHARLES GAYARRE
Contributes "Barthelemy de Macarty's Revenge," a true romance.

OTHER INTERESTING PAPERS.

A WOMAN ON HORSEBACK.
By Anna C. Brackett. With illustration. A practical paper on riding for exercise, fresh air, and health.
THE PHILOSOPHY OF CHINESE.
A study in the peculiarities of Celestial speech. By John Heard, Jun.
TWO PHASES OF AMERICAN ART.
By Mrs. Lucy C. Lillie. With six illustrations from rare paintings.
THE SMYRNA FIG HARVEST.
With eleven illustrations by Tristram Ellis.

POEMS.

UNCLE SAM'S NEW-YEAR.

IT is a happy new-year which dawns upon the country. It is at peace with all the world and with itself. It has just celebrated the completion of the first century of its constitutional government, and within that century it has removed the only serious menace of its continued prosperity. In doing that it has demonstrated the amazing flexibility and resistless force of popular institutions, and it has revealed the invincible moral power of the sentiment of nationality in a union of homogeneous States. The second century, which now opens before it, offers undoubtedly questions of scope as vast as those which it has encountered. But also there is the evident disposition to acknowledge their importance and carefully to consider their solution.

The danger of a republic, or the political rule of the majority, is the repression of moral courage. When the majority necessarily and lawfully prevails there is a disposition to regard the voice of the majority as the voice of right—*vox populi, vox Dei*—which is a fatal misapprehension. It is the man who can resist a majority who leads the world forward. The Americans of fifty years ago who were despised, rejected, hunted, mobbed, and ridiculed by the majority, are now seen to have been especially patriotic, and the chief authors of the national union and happiness of to-day. The disappearance of the main source of domestic dissension during the large part of the century which now ends, has produced a spirit which greatly facilitates the discussion and settlement of all other questions. Tariffs, trusts, corporations, taxation—these, and such as these, are ultimately social problems the wise consideration and disposition of which depend largely upon free schools, free suffrage, and free immigration. These introduce the forces that will settle every question and revise every tradition, and the proper comprehension of them is the first duty of every intelligent citizen.

In the immediate future of the next twelvemonth there is no prospect of great political excitement or disturbance. In Congress the administration majority is so small that radical changes in legislation cannot be anticipated. There will be an election for a new Congress; but it is improbable that the unbroken traditions of such elections will be deranged by any of the extraordinary propositions now pending in Congress. Unwise centralization of power is one of the tendencies to be strenuously avoided. Its partisan abuse would be inevitable and exceedingly dangerous to the public peace. Political opinion in the United States is in a more healthful condition upon this New-Year's Day than for many a year. The determined demand for ballot reform, and for reform in the civil service—in other words, for greater honesty in politics—is a significant and refreshing fact, over which every good citizen of whatever party sympathy may heartily rejoice. Americans are good natured and very busy and not easily alarmed, but when abuses and tendencies are so evident as to be startling and to require correction, the national good sense rises to the rescue. Upon the whole, Uncle Sam, as he sagaciously considers the situation and the prospect, may hopefully wish himself a Happy New-Year.

FAIR PLAY FOR THE PRESIDENT.

An elaborate demand for fair play for the President accounts for the general complaint of his party friends by the fact that during the ten months since his inauguration the President has been the victim night and day, at every moment, and without pity, of a furious horde of "party workers" clamoring for "recognition," that is, for the spoils of place. The President has been obliged, therefore, says his advocate, to surrender all his time and attention to this clamor, to suffer the other proper and really important duties of his office and the public welfare to shift for themselves, while he listens to endless deputations and the criminations and recriminations of factions and local politicians and Senators and Representatives to decide whether A or B or C shall be appointed postmaster at Pumpkin Corners. This is confessedly the business to which the persecuted President has given the first ten months of his term, and according to the article, as there are about five hundred persistent and anxious inquirers and endless bores for one petty office, the decision when it comes makes new trouble and jealousy and wrath and disaffection, and the situation is worse than ever.

This amusing and familiar and disgusting fact is gravely put forward as a plea for the President. It begs the country and his party friends to consider his dreadful situation, and to be very patient and forbearing, and to hope and pray that before his term expires he may be permitted a little time to discover the situation of public affairs and attend to some of the important trusts confided to him. A more ludicrous plea was never offered, nor a more unnecessary. The President himself has already proclaimed a simple disposition of the whole difficulty. The President's party invited votes for him by the declaration that "the spirit and purpose of the reform should be observed in all executive appointments," and the President himself announced that "fitness and not party service should be the essential test in appointment," that "fidelity and efficiency should be the only sure tenure of office," and that "only the interest of the public service should suggest removals from office."

The President, therefore, has only to act in accordance with the party platform and his own declarations. If he should "stick," as Mr. Sumner advised Mr. Stanton, the ten men whom the article describes as pressing the case of each of fifty applicants for a small consulate would go about their business until they could show that on public grounds the incumbent ought to be removed. Meanwhile, the article in question is a conclusive argument for "the further extension of the reformed system established by law to all the grades of the service to which it is applicable," as the platform of the administration wisely and well expresses it. We have no doubt that the President would regard the summary clean sweep of the five hundred bores out of the White House as the fairest possible play for himself.

THE TWO AMERICAS.

If there be any expectation that the American sentiment, the fact that the countries represented are all American, will affect the action of the Pan-American Congress in Washington, it is undoubtedly doomed to disappointment. South America is very much more remote and foreign to us than Europe, and South American states have much less relation of every kind with us, are much less known to us and in sympathy with us, than many European states. They are republics in name. But a South American republic has very little in common with the North American Union, while in race, language, religion, character, and customs the South American states are wholly different from the North American. Our commercial system has alienated South American trade; and as Mr. Albert G. Browne points out in a recent article, it is not at all probable that South America, as a whole, enjoys our quiet assumption of supreme domination of the Western hemisphere.

The South American states, as he shows, represent the Spanish power, which was the first to begin American settlement, but which has been entirely supplanted in importance upon the continent by the English-speaking race. It is very doubtful whether there is any particular South American gratitude toward us for our apparent purpose of control upon the Isthmus, while our recognition of the Spanish revolutionary contests with the mother country were moves in a general political game. Mr. Browne, who has been in the countries of which he speaks, gives a severe summary of their condition:

> "Five-sixths of their own population remain ignorant of letters and incapable of intelligent suffrage, with agriculture positively deteriorated from the times of the conquest, without manufactures, with little transportation save by the natural watercourses, with manual labor despised, and with the Church still so dominant in politics that in a majority of the Latin republics the free public exercise of any but the official religion is prohibited by their constitutions."

Of the ruling classes of Spanish America, which in no Latin country of this hemisphere, except possibly the Argentine Republic, constitute more than a tenth of the population, while the other nine-tenths are hewers of wood and drawers of water, Mr. Browne says that we do not comprehend their training, sagacity, and pride. He speaks of

> "their thorough Machiavellian study of the arts of statesmanship, their monopoly of all the sources of wealth depending on governmental action, the elegance of their social accomplishments, the genuine (though sometimes semi-barbaric) luxury of their social life, the perfection of their knowledge of the world through foreign education and travel, their contempt (not unmixed with terror) of the vulgarity of our Northern democracy, their capacity for command, and their hard-hearted willingness to subsist by the sweat of the brows of inferiors."

The Indian inhabitants of most of these countries are still the majority, and the half-breeds outnumber largely the whites of unmixed blood. These are details which are generally unfamiliar to those who cherish a feeling that American republics, because they are American, must have a secret and intimate affinity. Has this ever been the case? Yet what was to prevent it, if essentially and actually there was a bond of union? The causes which have separated us are those which separate all races and nationalities, and which constitute the chief present peril of this country, namely, a miscellaneous, unassimilated population. If commercial relations with our southern neighbors can be adjusted by the Congress with greatee reciprocal advantages, it will be a subject of general congratulation. But no kind or degree of political alliance or entanglement is more desirable with South America than with European states.

COMPULSORY EDUCATION.

"There are more children who attend no school in our State [New York] now than in 1874, when the State first adopted the principle that attendance must be compulsory if necessary." So says Mr. Draper, Superintendent of Public Instruction in New York, in a striking and forcible paper in the Troy *Times*. No man has ever devoted himself more intelligently and effectively to the interest of the school system of New York than Mr. Draper, or more plainly shown by his administration the great importance of his office to the welfare of the State. He truly says that in New York we are facing greater dangers than any other State, because of the enormous immigration that arrives and remains here.

The present compulsory law is practically of no avail. Only in two or three of the larger cities in the State, where there have been active interest, intelligence, and courage upon the subject, and where the necessity has been pressing, with authority and means to enforce the law, has it produced good results. But the same necessity is constantly increasing. The State pays many millions of dollars annually for the schools. In doing this it provides for its own benefit, but it also guarantees certain rights to its children. It ought to make that guarantee effective, and secure the result contemplated by its vast expenditure. This principle has been theoretically acknowledged by our legislation. But the chief officer of the State in the Department of Education now informs us that not only is not the principle enforced by the execution of the law, but that the necessity of its execution is greater and more urgent than ever before.

His recommendations to secure efficiency in such legislation are simple and practicable:

> "1. The law must specify the ages between which and months of the year within which all children must be in some school, either public or private, of suitable character, unless excused therefrom for sufficient reasons by official authority.
>
> "2. Parents and guardians must be made responsible for sending children to school, and must be punished sufficiently to insure compliance with the requirements of the statute.
>
> "3. Special institutions must be provided for thoroughly vicious and incorrigible cases which cannot safely be received into the ordinary schools.
>
> "4. The law must set up the machinery for securing and keeping continuously a perfect census of children of school age in each city or district, and it must provide and pay officers to look up and account for each child, and to execute all the provisions of the statute."

If interference with "the family" be apprehended, it must be remembered that the community most properly interferes to prevent abuse of children under that plea. It deprives parents of the care of children whom they neglect, maltreat, or abandon. For its own welfare it will not permit children to become burdens upon the State or perils to it. It will not allow drunken and vicious parents to outrage their children; and it has resolved, for its own sake and that of the child, that children shall not be deprived of their right to education. If neglect of the education which is freely provided be tolerated, the immediate result may not be the ruin of the republic, but that such neglect will hasten the development of evils which can be successfully encountered only with overpowering force and enormous expense is undeniable. Whether the new Legislature can spare time from politics for legislation is uncertain, but if it can, it could do the State no better service than the passage of a law such as the superintendent suggests.

THE INTERREGNUM IN BRAZIL.

Last week the news from Brazil seemed, as we said, to indicate a smooth present course for the revolution. But the sky darkened suddenly. The army was reported to be discontented, and the adhesion of Bahia, one of the provinces, to the new order was said to be doubtful. At the same time the elections were called not until September, and the grant to Dom Pedro was revoked, while the late Minister of Brazil in Belgium resigned his office to the late Emperor, not to the provisional government. All this was not promising, and it made the demand in the Senate for the immediate recognition of the republic untimely. In accordance with our traditions we have entered into friendly relations with the actual government. But to go farther, and in any other way to recognize the republic, might be to throw the moral weight of this government against the wishes of the people of Brazil. For the banishment of an emperor by an army, and the proclamation of a republic and of a provisional government by the generals, do not of themselves create a republic.

When the revolution occurred, followed by the accounts of the situation, upon which we commented last week, the complete acquiescence of the country seemed to be assured. And this will apparently prove to be the fact. The conviction that monarchy would die with Dom Pedro may have been as universal as has been represented, and the provisional government may hold by common assent until the change is ratified by the popular vote. Mr. Gibson writes to the *Times*, on the 30th of November, that a fortnight had passed since the departure of the Emperor without the slightest show of resistance in any of the twenty provinces, while the leader in one province whose attitude was doubtful was under arrest. All this is very significant and promising for the republican experiment for which the sentiment of the country is said to have been long ripening.

The event in Brazil, and, indeed, the general course of affairs upon this continent, was curiously forecast by a son of Madame de Staël, who, in 1825, wrote to George Ticknor, of Boston: "Yours is, indeed, a noble and blessed country, and the whole of America —when she gets rid of the Brazilian Emperor, which is only an unnecessary piece of ridicule—will present an unexampled scene of grandeur, wealth, and reason. But, for God's sake! keep your eyes open upon your slave States." Our principle in regard to recognition of a new government under the circumstances which exist in Brazil is definite and familiar. A government which with the expressed approval of the country is discharging unquestioned the duties of government is to be recognized. But mere acquiescence in a military government which has seized the power of the state cannot be assumed to be legitimate national approval.

ELECTION INVESTIGATIONS BY THE COURTS.

Mr. Lodge, chairman of the Committee of the House on National Elections, says that it is considering two subjects of especial importance, one is the investigation of contested Congressional election cases by the courts, and the other is ballot reform. The first of these would be a very salutary measure. The House, of course, cannot divest itself of its authority to decide, but the courts would investigate much more impartially than the House, which, as Mr. Lodge remarks, is never so partisan as when it assumes the judicial attitude upon a contested election. He also remarks that the only argument likely to be urged against the plan suggested is that it takes from the party majority the opportunity of making a purely partisan decision, as it would have to show good reason for reversing the recommendation of the court. But this argument would surely plague its inventor, and could not be wisely pressed.

The great advantage of the scheme, beside the more impartial decision, would be the immense saving of time for urgent and important business, the avoidance of mere partisan struggles, and the reduction of the number of contests. It is one of those greatly improved methods which have been tested elsewhere and found to be admirably effective. But although the argument against it might be futile, the adverse vote might be large, because it seems to affect the chances of party dominance. It is, however, an excellent test of the patriotic intelligence and good sense of the House, and Mr. Lodge's report will be awaited with interest.

In regard to ballot reform, after speaking of the excellent results of the new law in the States where it has been tried, Mr. Lodge says that the province of Congress in respect to such a law is of course limited, but where its own members are elected it ought to throw around the ballot-box the safeguards which the States may refuse. Like all wise legislation, however, the advisability of so great an innovation as Congressional interference in elections must depend upon careful consideration of all the facts.

A NEW PERIL OF THE STREETS.

"The name of a street," as the *World* truly says, "is a historic record." If Broadway, or the Bowery, or Maiden Lane, or Wall Street, should be deprived of its old and familiar name, a very great wrong would be done to public sentiment and to historic association. So to change the town name of Lexington, or Concord, or Saratoga, or Yorktown, would be as stupid and intolerable an act as to change the name of Mount Vernon or of Bunker Hill.

But the New York Board of Aldermen has recently deliberately changed the memorial name of one of the old streets of the city by transforming Howard Street into Harry Howard Street. John Howard, for whom the *World* says that the street was named, was an illustrious human benefactor, and it is a public service to commemorate his name in a manner to recall him to the public mind. Mr. Harry Howard was an excellent head of the old volunteer fire department in this city, but we venture to say he would not wish to see his name commemorated at such cost.

This kind of vandalism, if unchecked, would be most unfortunate. Franklin Square, for instance, is one of the interesting historic spots of the city. Here was Washington's first residence as President, and here George Clinton occupied the old Walton House, whence Citizen Genet took the old Governor's daughter as his bride; and the square was named in honor of Dr. Benjamin Franklin. The Board of Aldermen is capable of transforming it into John L. Sullivan or David B. Hill Square, and the worst of it is that it has the power to do it.

GOOD-NATURED UNCLE SAM.

Our amiable and learned visitor, Miss Edwards, does not speak of the condition and discomforts of New York so severely as our own citizens. "There are so many dangers," she says, "and the state of the highways is such, as to make it incomprehensible to English people that enterprising Americans would long endure it." The difference lies in temperament. John Bull is a resolute growler and grumbler, and Uncle Sam is good-natured. It used to be said that the thirteenth man in every omnibus in London was indignantly reported in the next morning's *Times*. But in New York all the passengers would stand from the Battery to Central Park without a murmur.

Judged locally in the city of New York, popular government would seem to be a failure. At least such municipal discomfort, disorder, inconvenience, and dirt could be found in no other city at such an enormous price. The patience with which the city permitted man after man to be cruelly and wantonly burnt and shocked to death by the carelessness of electric-light companies or the ignorance of the Electric Board would have given fiery print to a whole broadside of invective against effete despotisms, if they had quietly tolerated such a massacre. The theory of popular government is that a community will select its best and most capable citizens for its representative governors. *Vide* City Hall *passim*.

The adventures of a New York tax-payer in search of the benefits of taxation would be a pleasant book for the holiday season, except that truthfully it would end abruptly in the author's destruction by an explosion at a man-hole, or by touching an electric wire, or by submersion in any of the street swamps, or by hunger in a street railroad block, or by any other of the innumerable municipal perils which beset the metropolitan wayfarer. The stories which we read of the neatness and comfort of some great foreign cities are like accounts of the New Jerusalem. But if anybody should take the responsibility of telling such stories, he must expect to be spurned as a recreant American, corrupted by the gauds of monarchy and the wiles of a heartless and dissolute aristocracy. Better the streets of New York where discomfort is, than well-ordered highways where no aldermen are.

LAW AND ORDER.

Within the last twelve years an organization has arisen, and has spread widely throughout the United States and Canada, known as the Law and Order League. Its achievements in great cities like Boston, Chicago, Philadelphia, Pittsburgh, and Cincinnati are remarkable and interesting, and naturally stimulate and encourage similar movements elsewhere. The practical object of the League is very simple. It is merely the enforcement of existing laws. It does not aim at legislation, but promotes wise legislation by exposing the necessary result of unwise laws, holding, with General Grant, that the best way to secure the repeal of a bad law is rigorously to enforce it.

The laws which are most frequently evaded and abused are the liquor laws, and consequently much of the energy and effort of the Law and Order League has been directed to a prompt and exact observance of liquor laws. While some friends of temperance devote themselves to insisting upon prohibitory laws, the Law and Order League has addressed itself to the enforcement of the laws which already prohibit sales one day in seven, and six hours in twenty-four, and sales to minors, intoxicated persons, and habitual drunkards. The good results accomplished in this way are prodigious.

There are more than a thousand such leagues in the United States and Canada, which are now united in a national association, which has held seven annual meetings, and will hold its eighth in Toronto on the 22d of February, 1890. The advantage of the organization is obvious. It is really the organized moral and law-abiding sentiment of a community ready to co-operate with honest officers of the law, and a standing warning to officers of another kind. Any official violation or neglect of law which a citizen might not care individually to bring into court, the League is ready to prosecute. The consciousness of that fact naturally stimulates official fidelity and efficiency, while the public spirit which organizes the League exercises a healthful influence upon the nomination and election of competent and fitting local officers.

HENRY W. GRADY.

The representatives of the old South and of the new South have died together. Jefferson Davis was born near the beginning of the century, and Henry W. Grady when it was half spent, and at the time when the passage of the fugitive slave law had brought the sectional controversy to a fiery climax. Mr. Grady was little known to the country until his speech at the New England dinner three years ago. It was an impassioned plea for sympathy and consideration for those who, amid the ruins of a political, social, and industrial system, the general wreck of fortunes, and the complete disaster of exhausting war, were seeking to adjust themselves to wholly new conditions, some of them without precedent in history.

The tone of the speech was serious and friendly. The orator was evidently a gallant and ardent man of earnest convictions bent upon winning the confidence of those to whom he spoke, who welcomed his words with acclamations of pleasure and assent. As the editor of one of the chief papers in Georgia, Mr. Grady has continued the effort to show that the unwillingness to admit even in theory the political equality of all citizens does not imply any want of patriotism or of acquiescence in the fundamental American principle. Within a few days, in Boston, he had repeated in a glowing strain the same general plea, presenting striking statistics to show that the whites "treat the negro fairly," but agreeing that the problem of the two races could be solved only by time and by the Southern whites. He reported progress, and asked for patience.

Mr. Grady's death removes a strong individual force from the discussion and advancement of the settlement of a great question. The "problem" which absorbed his thoughts is one of the most difficult in human society. But the point in it which he least considered is one of the most vital. The question, he held—and it is the natural view of his part of the country—must be settled by those who are most concerned. But who are they? Are they not the people, not of Georgia or of Mississippi, but of the United States? Is this fact sufficiently considered? No reasonable man in this part of the country supposes that national supervision of Congressional elections will correct or do anything but inflame the situation. But if intelligent and patriotic white citizens assume the necessary and permanent political suppression of colored citizens, and a consequent illegal advantage in the government, do they also assume the universal acquiescence of the country? The cordial reception of Mr. Grady in New York and New England, and the sincere and even affectionate sorrow at his death, reveal the humane and fraternal spirit in which the problem which he presented can be effectively solved.

PERSONAL.

Few people know that the poet Whittier is color-blind, and has been so for years. He has just passed his eighty-second birthday, and seems to be in fairly good health. The weaknesses of age are upon him, however, and he rarely writes for more than half an hour at a time.

—As the widow of a Mexican war veteran, Mrs. Jefferson Davis is said to be eligible for a pension if she desires to ask for it. A decision given in a similar case by the Pension Department less than three years ago established a precedent.

—Neither the Pope nor those of the dignitaries who are nearest to him in the Vatican can speak or read the English language.

—Stephen Preston, the Haytian Minister, who has recently been recalled by his government, has been for years the dean of the diplomatic corps at Washington, a position accorded to the foreign representative who has been longest in service.

—The controversy as to which of two houses in Bonn was the birthplace of Beethoven having been settled, the building to which the honor was accorded is to be made a museum for the preservation of interesting and instructive relics of the great composer. To secure the funds needed for the purpose, concerts are now being given in this and other countries.

—Miss Mary Louise Baldwin, a young colored teacher, has been appointed Principal of the Agassiz Public School at Cambridge, Massachusetts. Miss Baldwin is highly educated, and has had several years' training in different grades of the school to whose head she is now promoted.

—The "b'gosh!" of Josh Whitcomb, of *Old Homestead* fame, must have been peculiarly emphatic when he heard the other day that his father, eighty-three years old, had remarried. The bridegroom is Rufus Thompson, of West Swanzey, New Hampshire, and the bride before her marriage was Mrs. Sarah A. Walker, of Westminster West, Vermont. Mrs. Thompson is seventy-five years old.

—Mrs. Laura Johnson, of Lexington, Kentucky, a colored woman, thirty-eight years old, has been installed as White House cook at Washington.

—President Seelye, of Amherst College, who is in Europe for his health, has been taking baths at Aix-les-Bains, with good results. He writes quite hopefully of his case.

—Benjamin H. Day, the founder of the New York *Sun*, died in this city the other day. When he started the paper the carriers refused to handle it because it was sold for a cent, so Mr. Day hired boys to do the work, and so created the newsboy.

—General Lew Wallace has invented a steel cross-tie, with which he expects to revolutionize railroad building.

—Never probably has the cross of the Legion of Honor been more worthily bestowed than in the case of Marie Thérèse, a French Sister of Mercy, who has just received it from the Governor of Tonquin. She was wounded in the trenches at Balaklava when she was but twenty years old, and since then she has been injured again and again on battle-fields in Mexico, Syria, and China while engaged in the ambulance service of her country. Once she picked up a grenade that had fallen among wounded soldiers, and carried it to a distance, saving her patients, but suffering severely herself from the explosion of the missile.

"WE PACKED OUR MULES IN THE CORRAL OF THE HOTEL."

THE AZTEC TREASURE-HOUSE.*

BY THOMAS A. JANVIER.

VI.—THE ENGINEER AND THE LOST-FREIGHT MAN.

THAT the weight of a strange destiny was pressing upon us, neither Fray Antonio nor I for a moment doubted. It was something more than chance, we believed, that had brought us together, and that thereafter, by such extraordinary means, had put into our hands, in places far asunder, yet at almost precisely the same moment, these two ancient papers; either of which, alone, would have been meaningless; but the two of which, together, pointed clearly the way to a discovery so wonderful that the like of it was not to be found in all the history of the world.

At the moment that I co[illegible]ided how great an adventure was before me, and what hono[illegible]ame I was like to get out of it, I determined that I would keep the whole matter secret from my fellow-archæologists until I could tell them, not what I intended doing, but what I actually had done—for I had no desire to divide with any one the honors that fairly would be mine when I published to the world the result of my investigation of this hidden community that had survived, uncontaminated, from prehistoric times. Having this strong desire within me, it was with great pleasure that I acceded to Fray Antonio's request that our project of discovery should not be published abroad. His motive for secrecy, as I presently perceived, was bred of the one single strain of human weakness that ever I found in him. Even as I was determined that no other archæologist should share with me the honor of discovering this primitive community, so was Fray Antonio determined that to him alone should belong the glory of carrying into that region of dense heathen darkness the radiant splendor of the Christian faith. If this were sin on his part, it certainly was a sin that he shared with many saints long since in Paradise. Even the blessed Saint Francis himself, when, at the Council of Mats, he portioned out among his followers the heathen world that they might preach everywhere Christianity, reserved for himself Syria and Egypt, in the hope that in one or the other of these countries he might crown his labors by suffering a glorious martyrdom. And perhaps in this matter Fray Antonio was not unmindful of the example set him by the great founder of the order to which he belonged.

But while we were thus firmly decided to keep to ourselves the honors that so great an archæological discovery and so great a Christian conquest must bring to us severally, we perceived that it would not be the part of prudence to essay our adventure without any companions at all. Some portion of the country through which we were to pass we knew to be frequented by very dangerous tribes of Indians, against the assaults of which two lonely men—neither of whom had any knowledge whatever of the art of war—could make but a poor stand. And even should we escape the wild Indians, we knew that we might get into many evil straits in which our lives might be ended, yet through which a larger company might pass in safety. And for my own part I must confess that I had a strong desire to have with me some of my own countrymen. For the gallantry of the Mexicans, which gallantry has been proved a thousand times, I have the highest respect; yet is it a natural feeling among Anglo-Saxons that when it comes to facing dangers in which death looms largely, and especially when it comes to a few men against a company of savages, and standing back to back and fighting to the very last, Anglo-Saxon hearts are found to be the staunchest, and Anglo-Saxon backs to be the stoutest which can be thus ranged together. But in our own case I did not at all see whence such an Anglo-Saxon contingent was to be obtained.

We had been talking over this matter of a fighting force one afternoon in Fray Antonio's sacristy—where our many colloquies were held, for we moved with a thoughtful deliberation in setting agoing our adventure—and we had come almost to the determination of organizing a little force of Otomí Indians, and calling upon two brave young gentlemen of Fray Antonio's acquaintance to join us as lieutenants. Although I was willing to adopt this plan, since no other was open to us, I was far from fancying it, both for the reason which I have already named, and also for the reason—and this Fray Antonio admitted was not without foundation in probability—that our young allies would be more than likely, by their indiscreet disclosures, to make our purpose fully known. Therefore, it was in no very pleasant frame of mind, our conference being ended, that I returned to my hotel.

As I entered the hotel court-yard I heard the sound of Pablo's mouth-organ, and with this much laughter and some talk in English; and as I fairly caught sight of the merrymakers, I heard said, in most execrable Spanish, "Here's a *medio* for another tune, my boy; and if you'll make the donkey dance again to it I'll give you a *real*."

That I might see what was going forward without interrupting it, I stopped behind one of the stone pillars that upheld the gallery; and for all that my mind was in no mood for laughter just then, I could not but fall to laughing at what I saw.

Over on the far side of the court-yard, with Pablo and El Sabio, were two men whose type was so unmistakable that I should have known them for Americans had I met them in the moon. One was a tall, wiry fellow, with a vast reach of arm, and a depth of chest and width of shoulders which showed what powerful engines those long arms of his were when he set them in motion. His face was nearly covered by a heavy black beard, and his projecting forehead and his resolute black eyes under it gave him a look of great energy and force. The other was short and thick-set, with a big round head stockily upheld on a thick neck, and with a good-humored face, which, being clean-shaven, was chiefly notable for the breadth and the squareness of the jaws. He had merry blue eyes, and his crown—he was holding his battered Derby hat in his hand—was as bare as a billiard ball. Below timber-line, as he himself expressed it, he had a brush of close-cut sandy-red hair. I had encountered both of these men when I first came to Morelia, and during two or three weeks I had seen a good deal of them, for we had met daily at our meals; and the more that I had seen of them the better was I disposed to like them. The tall man was Rayburn, a civil engineer in charge of construction on the advanced line of the new railway; the other was Young, the lost freight agent of the railroad company—whose duty, for which his keen quickness peculiarly well fitted him, was that of looking up freight which had gone astray in transit. Both of these men had lived long in rough and dangerous regions, and both—as I then instinctively believed, and as I came later to know fully—were as true and as stanch and as brave as ever men could be.

What they were laughing at, there in the court-yard, was an extraordinary performance in which the performers were Pablo and El Sabio. With a grin all over the parts of his face not engaged in the operation of his mouth-organ, Pablo was rendering on that instrument a highly Mexicanized version of one of the airs from *Pinafore* that he had just acquired from hearing Young whistle it. To this music, with a most pained yet determined expression, the Wise One was lifting his feet and swaying his body and nodding his head in a sort of accompaniment, his movements being directed by the waving of Pablo's disengaged hand. The long ears of this unfortunate little donkey wagged in remonstrance against the unreasonable motions demanded of his unlucky legs, and every now and then he would twitch viciously his fuzzy scrap of a tail; but his master was inexorable, and it was not until Pablo's own desire to laugh became so strong that he no longer could play the mouth-organ that El Sabio was given rest. As he ended his dancing I must say that there was on El Sabio's face as fine an expression of contempt as the face of a donkey ever wore.

---

* Begun in HARPER'S WEEKLY, No. 1722.

"Hello, Professor," Young called out as he caught sight of me, "have you given up antiquities and gone into the circus business? This outfit that you've got here will make your fortune when you get it back into the States. If you don't want to run it yourself, I'll run it for you on the shares. And I guess Rayburn 'll be glad to go along as clown. He'd make a good clown, Rayburn would. You see, we're both of us out of work, and both looking for a job."

"What do you mean by being out of work?" I asked, when I had shaken hands with them. "What's become of the railroad?"

"Oh, the railroad's got into one of its periodical bust-ups," Young answered. "A row among the bondholders, and construction stopped, and working expenses reduced, and pretty much all hands bounced, from the president down. I guess Rayburn and I can stand the racket, though, if the company can. I've been wantin' to get out of this d——d Greaser country for a good while, and I guess now I've got my chance. I must say, though, I wish it had come a little less sudden, for I haven't anything in particular in sight over in God's country, and Rayburn hasn't either. So if you want to start your circus we're ready for you right away. Where did you get that boy-and-donkey outfit from, anyway? They're just daisies, both of 'em, and no mistake!"

"I don't know that you can count on me for a clown, Professor," Rayburn said, "but I might go along as door-keeper, or something of that sort. But I don't believe that Young and I will need to go into the circus business. We are out of work, that's a fact; but the company has done the square thing by us—paid us up in full to the end of next month and fitted us out with passes to St. Louis. We're all right. Young is heading straight for home; but I rather think that I'll take a turn around the country and see what the civilized parts of it look like. Ever since I came down here, nearly, I've been at work in the wilds. I want to see some of the old temples and things too. You can put me up to that, Professor. Where's a good ruin to begin on?"

From the moment that I laid eyes on these two men, as I came into the court-yard, my mind was made up that I would do my best to induce them to join with Fray Antonio and me in our search for the hidden city; and I had listened very gladly to what they told me, for it showed me that I should not have to ask them to abandon profitable work in order to join in our doubtful enterprise. So we talked lightly about the circus and other indifferent matters for a while; and then we had a lively supper together at La Soledad (which always seemed to me a very original name for a restaurant); and then I brought them to my room to smoke their cigars.

It was while they were in the comfortable frame of mind that is begotten of a good meal and subsequent good tobacco—over there in Morelia we smoked the Tepic cigars, which are excellent—that I opened to them the great project that I had in hand. I told them frankly the whole story: of my strange adventure in the Indian village, of the paper and the gold token which the Cacique unwittingly had given me, of the letter that Fray Antonio had found, and of how our joint discoveries set us clearly in the way of finding an Aztec community that certainly had existed unchanged—save for such changes as had been developed within itself—since a time long anterior to the Spanish conquest of Mexico. I dwelt with enthusiasm, and I think forcibly, upon the inestimable gain to the science of archæology that would result from the investigations that we intended to make; and I touched also upon the scientific value that would attach to a careful and accurate description of the effect produced upon this primitive community by Fray Antonio's preaching. For this would be, as I pointed out, the first occasion in the history of the world when a record would be made, from the stand-point of the unprejudiced ethnologist, of the reception accorded by a heathen people to the doctrine of Christianity. In a word, I presented the case most glowingly—so glowingly, in fact, that my own heart was quite fired by it—and ended by urging them earnestly to join us in a work that promised so greatly to increase the sum of human knowledge touching the most interesting subjects that can be presented to the consideration of the human mind. And I am pained to state that I discovered, when I finished my appeal, that Young was sound asleep!

Rayburn did not go to sleep, and he did take a certain amount of interest in what I said; but I was discouraged by his very obvious failure to respond to my enthusiasm.

"You see, Professor," he said, "the fact of the matter is that I can't spare the time. I might take a month or two; but you seem to think that a year is the least time in which any substantial results can be accomplished. I can't give a year, or anything like a year, to what, so far as I am concerned, will be sheer idleness. I've got a mother and sister at home on Cape Cod who depend on me for a living, and I must get to work again. You see, there is glory enough in all this, and glory that I should like to have a share in; but glory is a luxury that I can't afford. I've got to go to work at something that has money in it."

The sound of Rayburn's voice had the effect on Young of waking him up. He listened, in a sleepily approving way, to Rayburn's practical comment, and then, giving a prodigious yawn, added, on his own account: "Yes, that's about the size of it. We're neither of us here for our health, Professor; what we're after is spot cash. If there was any money in your scheme I'd take a hand in it quick enough; but as there isn't—Well, not this evening, Professor; some other evening."

"No money in it!" I answered. "Why, haven't I told you that there is stored in this hidden city the greatest treasure that ever was brought into one place since the world began?"

"No, I'll be d——d if you have!" Young replied, with great energy and promptness. "Not a word—unless it was while I was asleep. What's he said about a treasure, Rayburn? I'm awake now, and I'll keep awake if there's anything like that to be talked about."

"You certainly haven't said anything about a treasure so far, Professor," Rayburn said. "I'd like to hear about it myself. If there is a treasure-hunting expedition mixed up with this scientific expedition of yours, that puts a new face on the whole matter. I can't afford the luxury of scientific investigation pure and simple; but if there is money in it too, that is quite another thing. So tell us about your prospect, Professor, and if the surface indications are good you can count on me to go in."

I confess that I was a trifle disappointed upon finding how eagerly these young men sought information in regard to a matter that I considered so unimportant that I had forgotten even to mention it. But I reflected that, after all, the motive by which they were induced to join in our adventure was immaterial; while our need for the strength that their joining in it would give us was so pressing that upon gaining them for allies very likely depended our eventual success. Being moved by which considerations, I dilated upon the magnitude of the hidden treasure with such vehemence that presently their eyes were flashing and the blood had so mounted into their brains that their very foreheads were ruddy, and their breath came short. And I must confess that my own pulses beat quicker and harder as I talked on. Of this treasure I had not before thought at all, being so thoroughly taken up with the scientific side of the discovery that I hoped to accomplish; but now I was moved profoundly by thoughts of what I could do for the advancement of science had I practically limitless wealth at my command. And especially was I thrilled by the thought of the magnificent form in which my own magnificent discoveries could be given to the world. Compared with my *Pre-Columbian Conditions on the Continent of North America*, Lord Kingsborough's great work, both in form and in substance, would sink into hopeless insignificance. And in all that I said of the vastness of the hidden treasure I felt certain that I was keeping well within the bounds of truth. For I had the positive assurance that in the Aztec treasure-house in that hidden valley the ransom of a nation was stored.

"Will you go with us?" I asked, when I had brought my glowing description to an end.

"Well, I should smile, Professor," was Young's characteristic answer.

"You can count me in now, and no mistake!" said Rayburn, and added, "By Jove, Palgrave, I mean to take a part of my share and buy the whole of Cape Cod!"

And so the make-up of our party was decided upon. Fray Antonio joined it for the love of God; I joined it for the love of science; and Young and Rayburn joined it for the love of gold. In regard to the boy Pablo, he could not, strictly, be said to have joined it at all. He simply went along.

VII.—THE KING'S SYMBOL.

Fray Antonio was well pleased when I told him of the stout contingent that I had secured. And when he had seen Rayburn and Young, and had talked with them—though his talk with Young did not amount to much, for Young's Spanish was abominable, he was as thoroughly satisfied as I was that for our purposes we could not possibly have found two better men.

In the course of this conference we made short work of our preparations for departure. Rayburn's experience in fitting out engineering parties had given him precisely the knowledge required for putting our own little party promptly and effectively in the field; and in this matter, and in all practical matters connected with the expedition, he took the lead. He and Young already possessed the regulation frontier outfit of arms—a Winchester rifle and a big revolver—which they increased by another big revolver apiece; and I armed myself, similarly, with a pair of revolvers and a Winchester—concerning the use that I should make of which, in case need for using them arose, I had very grave doubts indeed. Fray Antonio declined to carry any arms at all; and after he had accidentally discharged one of my pistols, which he had picked up to examine, so that the ball went singing by my ear and actually cut through the brim of Young's hat, there was a general disposition to admit that the less this godly man had to do with carnal weapons the safer would it be for all the rest of us. Young's hat was a battered Derby, and about as unsuitable a hat for wear in Mexico as possibly could be found. But for some unknown reason he was very much attached to that hat, and he was so wroth over having a hole shot through it in that unprovoked sort of way that he manifested a decided coolness toward Fray Antonio for several days.

In the matter of armament, the happiest member of our party was Pablo. He was a handy boy, and when he had demonstrated his ability to manage a revolver by doing some very creditable shooting with mine (at a mark that I had stuck up in the corral in order that I might gain ease in the use of this unknown weapon), I delighted him inexpressibly by buying him a pistol for his very own. I think that Pablo, upon becoming the possessor of that revolver, at once grew two inches taller. The way that he strutted as he wore it, and his eager thrusting forward of his left hip, so that this gallant piece of warlike furniture might be the most conspicuous part of him, were a joy to witness. For a time his mouth-organ was entirely neglected; and coming quietly into the corral one day, I found him engaged in exhibiting the revolver to El Sabio, who regarded it with a slightly bored expression that I do not think Pablo took in good part.

Rayburn decided that our expedition could be made more effectively with a small force than with a large one. He argued that unless we took into the Indian country a really powerful body of men, we would be safer with a very few—for a few of us would feel keenly the necessity of keeping constantly on guard, could be more easily managed and held together in running away; and in case a fight was forced upon us we would fight more steadily because each of us would know surely that he could rely upon the support of all the rest. Which reasoning we perceived to be so sound that we promptly accepted it.

Rayburn added to our company, therefore, only three men: two Otomi Indians of whom Fray Antonio gave a good account, and Dennis Kearney, who had served as axeman on the recently disbanded engineering corps. He was a merry soul, this Dennis, with a stock of Irish melodies in his head that would have made the fortune of an old-time minstrel. He and Pablo took to each other at once—though, since neither of them spoke a word of the other's language, music was their only channel of communication—and Pablo presently presented us with a rendering on his mouth-organ, from a strictly Mexican stand-point, of "Rory O'More" that quite took our breaths away. While Pablo played, Dennis would stand by with his head cocked on one side, and with an air of attention as closely critical as that which El Sabio himself exhibited; and when Pablo went wrong, as he invariably did in his attempted bravura passages, Dennis would stop him with a wave of his hand, and an "Aisy now, me darlint! That's good enough Mexican, but it ain't good Irish at all, at all," and then would show him what good Irish was by singing "Rory O'More" in a fashion which made the old stone arches ring with a volume of music that could have given odds to an entire brass band. Poor Dennis! Only the other day I heard an organ-grinder grinding forth "Rory O'More," and the memory of the last time I heard Dennis sing that song, and of what heroic stuff that merry-hearted rough fellow then showed himself to be made, came suddenly over me, and there was a choking in my throat, and my eyes were full of tears.

Well, it was a good thing—or a bad thing, as you please to put it—that we could not see far into the future that morning when we packed our mules in the corral of the hotel, and set out upon the march that was to lead us through such perilous passages before we reached its end.

That I might fill to the brim the cup of Pablo's happiness—for my conscience pricked me a little that I suffered him to go with us—I had bought him the rain-coat of palm leaves for which his heart so long had pined. What with this and his revolver, and the delight of going upon a journey (for he had very fully developed that love of travel which is so strong in his race), his wits seemed to be completely addled with joy. He insisted upon putting on his absurd rain-coat at once; and he did so many foolish things that even El Sabio looked at him reproachfully—this was when he tried to place on that small donkey's back some of the heavy pack-stuff destined for the back of one of the big mules—and we got along much better with his room, as he presently enabled us to do, than we did with his company. When the time for starting came, we had quite a hunt for him; and we might not have found him at all had we not been guided by the sound of music to the sequestered spot to which he had retired in order to give vent to his pent-up feelings by playing on his mouth-organ "Pop goes the weasel"—an air that Young had been whistling that morning, and that had mightily taken Pablo's fancy.

We made rather an imposing cavalcade as we filed forth from the great gate of the hotel, and took our way along the Calle Nacional, the principal street of the city, toward the Garita del Poniente. Fray Antonio and I rode first; then came Rayburn and Young, followed by Dennis Kearney; then the two pack-mules, beside which walked the two Otomi Indians; and closing the procession came Pablo, wearing his rain-coat, with his revolver strapped outside of it, and riding El Sabio with a dignity that would have done honor to the Viceroy himself. Pablo certainly was in the nature of an anti-climax; but I would not have told him so for the world. Fray Antonio wore the habit of his Order, this privilege having been specially granted to him by the Governor of the state as a safeguard for all his expeditions among the Indians. It was understood, indeed, that he now was going forth on one of his missionary visits among the mountain tribes, and simply rode with us as far as our ways should lie together, for greater security. I had announced that I was going among the Indians again in order to increase my knowledge of their manners and customs; and Rayburn—to whom the rest of the party was supposed to belong—had stated that he was taking the field in order to make a new reconnoissance along the line of the projected railway. It was in order to maintain these several fictions that we went out by the western gate, and that we continued for two days our march westward before turning to our true course.

Of our progress during the ensuing fortnight it is not necessary that I should speak, for beyond the ordinary incidents of travel no adventures befell us. During this period we went forward steadily and rapidly, and at the end of it we had covered more than three hundred miles, and had come close to where—supposing our rendering of the Aztec map to be correct, and that we had rightly collated it with the dead monk's letter—the mission of Santa Maria had stood three centuries and a half before. There was no possibility that any trace of this mission would be found; but every rock that we came to was most eagerly scrutinized, for on any one of them might we find the King's symbol engraved.

For two or three days we had been travelling through a region very wild and desolate. Far away, along the western horizon, rose a range of mountains whose bare peaks cut a jagged line along the sky. The country between us and these far-away mountains was made up of many parallel ranges of rocky hills, which ranges were separated by broad, shallow valleys, where cactus and sage-brush covered the dry ground thickly, and the only trees that broke this dreary monotony were pita-palms—the most dismal thing in all created nature to which the name of a tree ever has been given by man. There was no trail, and travelling through this tangle of briers was very difficult. All of Rayburn's skill, which long practice had developed to a high degree, was required to enable us to pick a way through so thorny a wilderness. At times the Indians with their machetes, and Dennis with his axe, had to cut a path for us; and, despite all our care, our own hands were cut and torn, and the legs of our poor beasts were red with blood.

The deadly dryness of this arid waste added to our discomfort. A strong dry wind blew steadily from the north, building up out of the fine dust which was over all the surface of the baked ground little whirlwinds—*remolinos*, as the Mexicans call them—which went dancing down the valleys as though they were ghostly things; and occasionally, when one of these struck us, we were covered with a prickly dust that fairly burned our skins. What water we got was to be had only by digging in the *arroyos* which traversed the centre of each valley longitudinally; and although this water always was muddy, and had a strongly alkaline taste, it is the only thing that I remember with pleasure in all that weary land. Of animal life there was nothing to be seen, save a plenty of rattlesnakes, and a few great buzzards which wheeled above us from time to time as though with the intention of keeping track of us until we should fall down and die of thirst and weariness, and they should be able to feast upon us at their ease.

At the end of the third day of this dreary travelling we had come close to the great western range of mountains, and our camp that night was made in the mouth of a little valley that opened from among the foot-hills. The night before, we had made a dry camp, and for the whole of the twenty-four hours we had had but a pint of water apiece. Pablo, I am sure, had given half of his own scant allowance to El Sabio. The other animals—it was all that we could do for them—had only their dusty mouths and nostrils wiped out with a wet sponge. They were pitiable objects, with their bleeding legs, their haggard eyes, their outhanging tongues, and their quivering flanks. As Fray Antonio unsaddled his horse I saw that in his eyes were tears; but the rest of us, I fear, were too thoughtful of our own misery to feel much sorrow for the misery of our beasts.

I suppose that a man must suffer the lack of it, as we then did, in order to know how precious a thing water is. And to give some notion of its preciousness to those who not only are free at any time to drink their fill of it, but even can fill bath-tubs with it, and feel the joy of it on their bare bodies whenever they are so minded, I will say that when a little digging gave us that night as much water as we wanted our joy was far greater than it would have been had we there found the hidden city of which we were in search.

Our well was sunk in the broad sandy bottom of the *arroyo*, in the midst of a narrow and delectably grassy valley between two foot-hills. And the abundance and the sweetness of the water, as well as the presence of grass, showed us that here a little way up this valley there must be an open stream. We drank, and our beasts drank, until all of our skins were nigh to bursting; and the abundance of water was so great that we even could wash the dust at last from our parched faces and necks and arms; and much like raw beef our skins looked when our washing was ended, and the stinging of them was as though we had been whipped with nettles. It was our intention now to leave the plains and to march along the edge of the foot-hills, parallel with the main range, otherwise we should not have ventured thus to wash ourselves. In a region where alkali dust is in the air, washing is to be shunned; for, each time that the skin is cleaned, the new deposit of dust takes a deeper biting hold.

It was rather that we might escape the misery of further travel on the arid plains than because we had any strong hopes of thus finding the way of which we were in search that we had decided to change our line of march. Young had begun openly to express his contempt for the Aztec map; and in the hearts of all of us had sprung up some doubts as to its trustworthiness as a guide. After all, it was not in the least a map in the true meaning of the word; and that it should show us rightly our way depended not only upon our having interpreted correctly its curious symbolism, but also upon the correctness of the interpretation that Mexican archæologists had given to the map of the first Aztec migration—of which map, as we believed, our map was a reserved and secret part. If either interpretation was wrong, then we might be hundreds of miles distant from the region in which the way marked by gravings on the rock of the King's symbol should be sought.

Four or five hours of daylight still remained to us after we had dug our well, and with the delicious water flowing into it had satisfied our thirst. But we had no intention of going further that day. We had no need to hobble the animals, for they could be trusted to stay near the water-hole while they feasted on the grass, and we needed food and rest quite as much as they did. Young and Dennis together got us up a famous meal, and when it was ended we lighted our pipes and held a sort of council of war. That we might talk the more freely, in both English and Spanish, we drew away a little from where the two Otomi Indians and Pablo were stretched out upon the grass together; and we bade Dennis take a look around the shoulder of the first hill, so that we might know something of what our way would be like when we started in the morning; for we were not as yet ready that the minor members of the expedition should know the purpose that we had in mind. We had decided that when, by the finding of the course indicated by the gravings of the King's symbol, our quest fairly had a beginning, being no longer a matter of mere hope and conjecture, we then would give Dennis and Pablo, and the two Indians, some notion of what we intended doing, with the option of deciding for themselves whether or not they would have a part in it. And the thought never once occurred to us that circumstances might arise of such a nature that neither they nor we would have any choice in the matter at all.

As we consulted together we had spread out before us a map of Mexico, and with this the map that the Cacique had given me, and a copy of the map showing the great Aztec march. Yet the more that we counselled the less could we come to any reasonable conclusion as to what was best for us to do. As nearly as we could tell from the strange guides that we needs must be led by, we had beaten thoroughly the region where once the mission of Santa Marta was, and not a trace of the gravings on the rocks had we found. To go over that region again, searching still more minutely, was too great an undertaking even to be thought of; and yet the only alternative to this painful course seemed to be that we should abandon our search altogether; in short, we were completely at sea.

"What *I* think," said Young, "is that that old dead monk, and that old dead Cacique, have set up a job on us. They're both of 'em lyin' like fiddlers; that's what's the matter with *them*. There ain't any hidden city, or hidden treasure, or hidden d——d anything; it's all a fraud from beginnin' to end. I vote to pull up stakes an' go home."

A cool refreshing wind was beginning to sweep down to us from the mountains, but it was blowing only in puffs as yet, for the night would not be upon us for several hours. Borne faintly and fitfully upon this uncertain wind came to us the strains of "Rory O'More," with which melody, as we inferred, Dennis was beguiling his solitude while he explored the route that we were to take the next day. Pablo, sitting comfortably on the grass, his back propped against the back of El Sabio, also caught the sound, and straightway began to play an accompaniment on his mouth-organ to Dennis's distant singing. The strains gradually grew louder, showing that Dennis was returning; but when they stopped suddenly we thought that he had only tired of the sound of his own voice, or, perhaps, did not think anything about the matter at all.

But when a sound of hurried, irregular steps came down the wind to us, we all were on our feet in a moment and had our arms ready, for it was evident that Dennis was running from something; and the danger was likely to be a serious one, for running was not at all in Dennis's line. We wondered why he did not call out; but the explanation of his silence was plain enough, ten seconds later, as he came around the shoulder of the hill, staggered in among us, and fell on the grass at our feet, with the blood streaming from his mouth and nostrils, and an arrow clear through his breast.

"Indians!" he gasped, with an effort that brought a torrent of blood spurting from his mouth; and he added, faintly, "But I've bate 'em, th' divils, in their hopes of a surprise!"

That triumphant utterance was the last that Dennis Kearney made on earth. As he spoke, a fresh outburst of blood came from his nostrils and mouth, a quiver went over him—and then he was dead. I don't believe that many men would have done what Dennis did: run a good quarter of a mile with an arrow through his lungs, and then die exulting because he had succeeded in warning the camp.

Rayburn had the situation instantly in hand. "Get the packs and saddles on quick!" he cried. "The Indians 'll come around that hill and try to scoop us here in the open. They won't close in; they'll keep off, and just lie around for a week till we're played out, and then they'll step in and finish us; they'll do that, likely enough, anyway. But our one chance is to get to a place up the valley here, where they can tackle us only from in front. There's water up there, so we'll be all right, and we may be able to shoot enough of them to make the rest give it up, or they'll close in, and we'll have the comfort of getting the whole thing ended without any useless fooling over it."

All the while that he spoke he was working away, and so were we all, at saddling and packing, and luckily the animals, although the water and the food and the rest had put new strength into them, still were too tired to give us the trouble that animals give at such times when they are fresh. In a surprisingly short time we were ready to start; and yet not a sign had we had, save the warning that Dennis had brought us, that there was an Indian within a hundred miles of us. Indeed, but for his dead body on the ground beside our camp fire we might have imagined that our scare was only a bad dream. That it was a very bad reality was shown just as the last pack went on, when one of our Otomi Indians gave a howl as an arrow went through his leg, and I felt a sharp little nip on my forehead where an arrow just grazed it, and there was that queer, faint whirring sound in the air that only a flight of a good many arrows together will produce.

Rayburn took the body of poor Dennis before him on his own horse; he'd be d——d if the Indians should get Dennis yet, he said; and away we went up the sandy bed of the *arroyo*, driving the mules before us, and the Otomi Indians pelting along on a dead run. The Indian who had been hit coolly broke the arrow off short, and then pulled it out through the wound.

Suddenly we saw Young, who was riding a little ahead of the rest of us, half pull up his horse and look earnestly at a great shoulder of rock that jutted out from the mountain-side. "There's your King's symbol, and be d——d to it!" he shouted; and added, "What's the good of a King's symbol when we're all goin' to lose our hair?"

He was under full headway again in a moment. As we shot past the rock we all turned to look; and there, sure enough, was the long-sought-for sign.

[TO BE CONTINUED.]

A MICHIGAN IRON MINE.

SCARCELY have the deer and rabbit found their accustomed trails through the carpet of the first snowfall, before the woods of northern Michigan begin to echo with the stroke of woodsmen's axe and the clink of miner's pick. A ride of twelve hours from Chicago will bring us to the heart of the mining regions of the Upper Peninsula, and a single night's journey places before us a more sudden and complete transformation of scenery than was ever accomplished behind stage curtain. Leaving the Union Depot at Chicago by midnight on the Milwaukee and Northern train, the traveller may next morning peer drowsily through the windows of his berth upon a white wilderness of pine and hemlock stretching unceasingly toward the horizon. By noon he may wander along the ore piles at Iron Mountain, or gaze upon the vast open pits of the old reliable mines at Ishpeming, or be far on his way toward the newly opened districts of the Gogebic range.

The coming of winter is eagerly looked for by the explorer for mineral wealth, for with the first snowfall the trackless woods are open to travel, and forests which none but the Indian and the government surveyor can penetrate in summer are easy of access. The possibility that ore may underlie this or that section of land is usually first suggested by the "cruiser" or explorer for some of the land and lumber companies which have almost monopolized the Upper Peninsula. To a man accustomed to read the signs of the woods, the earth around a burrow or the gravel in the roots of a windfallen tree is full of meaning. Perhaps scattered fragments of ore may be found on the surface of the ground, and by such tokens the owner of the land is induced to try his luck in the search for ore.

A crew of woodsmen and miners is soon engaged, and a tote road is cut from the nearest town to the proposed site of the exploration. Log houses, roofed with bark, are put up for the men; the ground is cleared around the spot where the test pit is to be sunk, and in a few days the clink of the pick and the scrape of the shovel are heard in the woods, and the curious squirrels waken to wonder what new order of things this may be that has broken their winter siesta. Blue smoke curls languidly through the pine tops from the cabin where the Canadian "cookie" sings over the cooking stove; hoarse shouts of "Hoist oop!" come from below-ground, and the windlass answers complainingly as stalwart Cornishmen strain at the handles, hoisting gravel and clay from the shaft that pushes deeper and deeper beneath the grass roots.

After a few weeks of work, sinking through gravel, the ledge is struck, and if the rock seems to indicate the neighborhood of ore, the work of opening a mine begins in real earnest. The rock is pierced with drill and hammer, and charges of dynamite or giant powder inserted in the holes, up the ladders the men scramble and wait, while below one of their number lights the fuse. In a few seconds he too emerges panting, and from behind logs and other coigns of vantage the men listen till the blast booms below, and splintered rock and gravel rattle on the cabin roofs. As the upturned edges of the rocks are cut across, their character changes. Gray slate gives place to red slate, and jasper to soapstone; till one day, as the miners gather to examine the rock thrown out by a blast, one of their number picks a soft blue fragment from the debris, and a shout goes up to surface: "Boy, up there! Tell Jimmy to run into town and tell the boss we've struck ore in the breast of the crosscut."

Come back again in a couple of years to where the test pit struck ore, and you will find the scene totally changed. Instead of woods, an open clearing surrounds you. Skeleton trestles stretch their legs beside railroad tracks; locomotives whistle and ore cars rattle over the rails where a few years before the bear and beaver enjoyed sole right of eminent domain. There yawns a vast open pit with cavernous sides, from which cranes are hoisting ore buckets as fast as ore can be shovelled in by the laborers below. Up an inclined railway from out the open pit, labors slowly, like some subterranean turtle, a skip, heavy-laden with ore. It reaches the top of the incline, butts its head into a scaffold, reverses its centre of gravity, and rattles its load into the ore cars on the track below.

Yonder, at the mouth of the shaft, stands the captain of the mine, with smoking oil lamp stuck in hat ready to go below, a sturdy, gray-bearded Cornishman, with a humorous twinkle in his eyes as he notes our evident curiosity. To him we state our desire, and gain a cordial assent to our request to visit the underground workings. In a few minutes, clad like the captain in ungainly oilskin coat and trousers like sections of stove-pipe, we step into the skip, and the blue daylight fades rapidly behind us as we rattle and plunge into the Cimmerian darkness of the shaft. Past dripping timbers and ladderways we glide, with no small misgivings as to the strength of the rope that forms our sole communication with the world above. The skip slackens speed, and bumps at last upon the bottom of the shaft, and we stumble along the crosscut in the captain's wake toward the main drift on the fifth level. Here plunges toward us, from the inner darkness, a rumbling something with a gleam of lights behind it. At the captain's warning signal we step to one side to let pass the ore car which is pushed by grimy trammers toward the shaft. It passes and is gone in darkness, and we hear the rattle of ore dumped into the skip to be hoisted to the stock piles above.

"This," explains the captain, "is the main drift, on the fifth level, five hundred feet underground. Here is a room, or stope, as we call it, from which ore is being mined. All along the level these rooms are cut out in the ore, and between every room a mass of ore is left for a pillar to support the mine. These logs here are timbers, used in each room to support the ore overhead as it is removed from below."

We are in a chamber about twenty feet wide and forty feet long; stout pine logs, crossed by other beams overhead, stand at regular intervals eight feet apart, forming skeleton cubes, or "sets," as the captain terms them, reaching one above the other as high as our lamps will throw light above us. Each of these timbers, we are told, is placed exactly underneath a corresponding timber in the room above, so that when the ore on this level is removed, and the last set of timber placed into position, the whole mine is filled with this timber framework.

"If you wish to see the men at work," says the captain, "you can follow me up into the room." So we scramble, as best we may, after him, up devious ladderways, among the forest of timber, till we emerge on a platform of small pine logs placed across the sets. Above and around us the blue ore, with here and there a crystalline white seam of lime, glistens in the light of our lamps. Here work the miners; one bending on his knee holds a drill in the ore, turning and turning it between the strokes of a heavy hammer that his comrade swings with rhythmic regularity. To one side another loosens with a pick the ore shattered by a previous blast, and allows it to fall between the timbers into chutes on the level below. In one corner of the room the timber men are chopping and sawing on pine logs, as they place another set of timbers in a part of the room which the miners have stripped of ore as high as they can reach. Next week the pine platform will be shifted eight feet higher, on top of the next set of timbers, and so the mine is gradually worked out from each level to the level above.

To one side hangs a rope, and glancing up is discernible an opening in the roof, down which a ladder protrudes into sight. In answer to our question the captain tells us that this is a "winze," or small untimbered shaft leading from the level above, for the double purpose of ventilating the room, and allowing timbers to be sent down and built into "sets" as fast as the ore is removed. After satisfying our curiosity as to the manner in which the ore is broken out, we manage, by some unusual gymnastic exercise on our part, to reach the ladder in the winze, and climb up to the room above.

Here are the same rooms and pillars as on the level we have left, and along the drifts ore cars are pushed heavily toward the shaft, and whirled easily back to the chutes to be refilled.

We pass the incline shaft and catch a glimpse of daylight overhead. Here the same skip we noticed above is waiting on the level to be refilled by the trammers. From below we can hear the ringing of drills as the miners work at sinking the shaft.

One of the greatest bugbears in shaft-sinking, we learn from the captain, is quicksand, which often covers the ledge of ore. Months of weary labor and thousands of dollars may be spent, and still the quicksand oozes through the timbers, and not a foot of progress can be made. Thanks, however, to the invention of a German physician, the dreaded quicksand can now be removed as easily as so much gravel or bowlder clay.

In the city of Iron Mountain the Chapin Mine determined last winter to sink a shaft through quicksand to a body of ore which had hitherto been inaccessible. To accomplish this, the new Poetsch process, as it is called, from its inventor, was resorted to. Around a circle of thirty feet in diameter a series of twenty-six large iron pipes was driven down through clay and sand to the ledge, 110 feet below. A smaller pipe was then led to the bottom of each, and by means of huge ice-machines a continuous stream of freezing mixture at a temperature of seventeen degrees below zero was led up and down the pipes till the whole circle was frozen across, and the treacherous quicksand required to be blasted and broken, like the hardest granite.

On our way back to the shaft down which we came we pass a crosscut in which a deafening hammering announces that a power drill is at work. A pile of rock almost hides from us the end of the crosscut, where two miners have charge of the drill. The motive power is compressed air, and by its expansion such intense cold is produced that, even in summer, the escape valve is always covered with ice. A vicious-looking and decidedly dangerous machine this is, which, braced firmly on three legs, is stabbing incessantly at the splintered rock before it. One man, from a tin pail, dashes water constantly in the hole which is being drilled, while another, with his hand on valve and screw, forces at each stroke the drill a little deeper into the rock.

But we must return to the surface; so the captain leaves us with a skip tender at the shaft. The skip rattles down empty, and we step on the bail, and take a firm grasp on the rope. The skip tender pulls six jerks at the signal rope; six strokes clank in the shaft-house above; the lander in the shaft-house repeats the signal, and the electric bell in the engine-house rings "six bells." The brakeman reads the signal, "Hoist up with a man aboard," and the rope tightens slowly in response to his grasp on the brakes. The skip rattles and jerks as it rises to the surface, and leaves us at the mouth of the shaft, dazzled and blinded by the blue light of the sunshine and the snow-clad world that lies white and dry around us, in such sharp and sudden contrast to the dank darkness and the yellow glimmer of oil lamps we have just left behind in the depths of a Michigan iron mine. A BEEF ISSUE IN THE INDIAN TERRIT

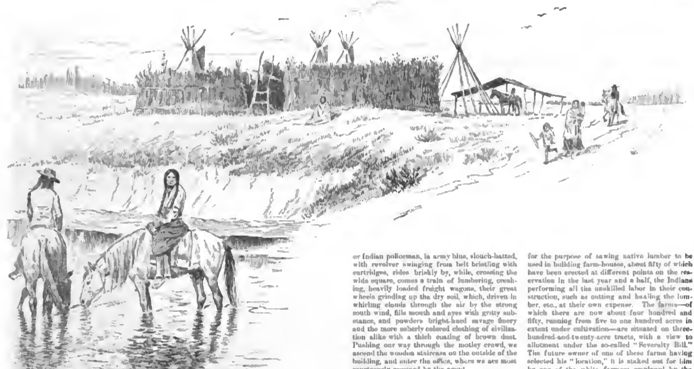
Y.—Drawn by R. F. Zogbaum.—[See Page 10.]



ON THE ROAD TO THE AGENCY.

LIFE AT AN INDIAN AGENCY.

THE treatment of the original inhabitants of the territories over which the government of the United States has extended its sway during the last twenty-five years has been—and still continues to be—one of the most difficult problems ever encountered in the development of any great nation. Marching eastward from the Pacific and westward from the turbid waters of the Missouri, stretching in two thin blue threads from the "British line" to the Mexican frontier, our gallant little army has steadily closed in on the savages, "rounding up" the scattered tribes and gathering them in upon the immense reservations of land set apart for their use. The government has established agencies to represent it with the various tribes with which it has made treaties, and it is the object of this paper simply to describe the life at one of these agencies.

The reservation allotted to the Southern Cheyennes and Arapahoes is situated in the Indian Territory, south of the so-called "Cherokee Strip" and west of the famous promised land of the "Boomers," the Oklahoma country, and, according to General Sheridan's report to the President in 1885, contains within its limits 4,297,771 acres, "excellent for grazing, and most of the land susceptible of the highest cultivation." Extensive tracts of timber—scrub-oak, cotton-wood, pecan, and walnut—line the streams and the sides of many of the cañons, and cover wide sections of rolling prairie country; game—such as wild turkey, prairie-chicken, quail, and deer—abounds. The enrolment taken during General Sheridan's visit showed a total of 2169 Cheyennes and 1300 Arapahoes, distributed in "bands" over the reservation.

Near the military post of Fort Reno, and on the North Fork of the Canadian, lies the collection of government buildings forming the agency for these Indians, and known to the post-office officials and marked down on the maps under the name of Darlington. Here the agent resides, and here—in a great brick building fronting a wide unpaved plaza or square, on the various sides of which stand the stores of the Indian traders, a hotel, and the livery and stage stables, whence the stage line carries the mail and passengers to the railroad, thirty miles away—is situated the main office or agency for the two tribes mentioned. On some streets branching off from a park of rather ragged and forlorn appearance, in which a few trees raise their crooked branches into the air, are placed the residences of the employés, the schools, and the saw-mill, the blacksmith, wagon, and tin shops.

Driving out from Fort Reno, we rattle over the prairie past the camp of the Indian scouts, their lodges pitched in military order on a little rise overlooking the plain toward the agency; past the cavalry horses on herd, scaring up great flocks of blackbirds, and causing the little prairie-dogs to pop into their burrows with shrill barks of anger and alarm; past some camps of redskins who have come in to draw their rations, their wagons standing near by, and their tough little horses "lariated" out to graze; through great thickets of sunflowers, past Indians on horseback, squaws and papooses in wagons, to the wooden bridge over the river, where some more Indians, tall, wild-looking, handsome fellows, are watering their horses, their figures reflected in the clear shallow stream. We move slowly over the not too firm-looking structure, and then more rapidly on [illegible] over the wide dusty road, skirted by the [illegible] frame houses forming the residences of the [illegible] and some of the employés, until, swinging to the right, we draw up at the door of the huge brick commissary building. Groups of shaggy, wiry ponies are tied to wagons, or held by waiting squaws, whose lords pass in and out of the wide doorway, or stand about in little knots chatting and smoking; now and then a mounted "buck" or Indian policeman, in army blue, slouch-hatted, with revolver swinging from belt bristling with cartridges, rides briskly by, while, crossing the wide square, comes a train of lumbering, creaking, heavily loaded freight wagons, their great wheels grinding up the dry soil, which, driven in whirling clouds through the air by the strong south wind, fills mouth and eyes with gritty substance, and powders bright-hued savage finery and the more soberly colored clothing of civilization alike with a thick coating of brown dust. Pushing our way through the motley crowd, we ascend the wooden staircase on the outside of the building, and enter the office, where we are most courteously received by the agent.

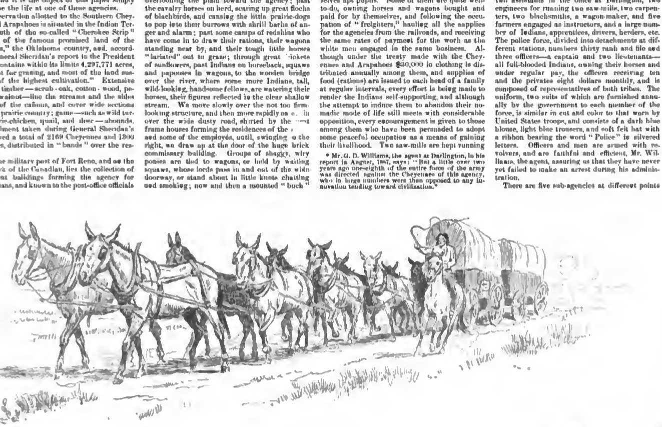
We have ample time to look about us here, for it is Monday, the busiest day of the week, and while the agent is engaged in listening to the various recitals of his tawny charges and in answering their questions, we sit back in the easy-chair by the side of his desk and leisurely "take in" the scene before us. A number of the Indians have evidently come in for a "talk," for they are crowded into the room, some seated on the chairs lining the walls, some lounging, blankets drawn in graceful folds about them, in the doorways. A few are clad in their picturesque native dress, but almost all of them wear some articles of civilized clothing, and as seen through the blue clouds of cigarette smoke they present an interesting picture, with their wild but expressive and intelligent faces, each in its setting of long, black, straight hair, their bright eyes, and graceful gestures as they converse together in low guttural tones. Among them are some of the leading men of the Cheyennes, but a short time ago the fiercest and most formidable of the hostile tribes.[*] Many of their most daring warriors and skilful soldiers, however, finally overawed by the strong arm of the government, and realizing the hopelessness of further armed resistance against their white conquerors, are now the most eager to learn how to travel "on the white man's road," and are rapidly proving themselves apt pupils. Some of them are quite well-to-do, owning horses and wagons bought and paid for by themselves, and following the occupation of "freighters," hauling all the supplies for the agencies from the railroads, and receiving the same rates of payment for the work as the white men engaged in the same business. Although under the treaty made with the Cheyennes and Arapahoes $40,000 in clothing is distributed annually among them, and supplies of food (rations) are issued to each head of a family at regular intervals, every effort is being made to render the Indians self-supporting, and although the attempt to induce them to abandon their nomadic mode of life still meets with considerable opposition, every encouragement is given to those among them who have been persuaded to adopt some peaceful occupation as a means of gaining their livelihood. Two saw-mills are kept running for the purpose of sawing native lumber to be used in building farm-houses, about fifty of which have been erected at different points on the reservation in the last year and a half, the Indians performing all the unskilled labor in their construction, such as cutting and hauling the lumber, etc., at their own expense. The farms—of which there are now about four hundred and fifty, running from five to one hundred acres in extent under cultivation—are situated on three-hundred-and-twenty-acre tracts, with a view to allotment under the so-called "Severalty Bill." The future owner of one of these farms having selected his "location," it is staked out for him by one of the white farmers employed by the government as instructors, who encloses ten acres with a wire fence, the Indian cutting and setting out a sufficient number of posts for the purpose. The ground is then broken at the expense of the government; the necessary farming implements, seeds, etc., are furnished gratuitously to the embryo agriculturist, who, under the instruction of his white teachers, is left to work out his own salvation by the sweat of his brow.

Wild, untutored, unaccustomed to restraint, and suspicious by nature as the Indians are, the position of the government's agent is a difficult one, requiring great patience, tact, and careful judgment on the part of the official filling it. He is often called upon for advice even in matters concerning the family affairs of individuals, must listen to their complaints, and endeavor to see that all are treated with equal justice in their dealings with the "Great Father," whose representative he is. He must superintend and hold to account the sub-agents and employés, attend to the handling of the supplies intended for the use of the Indians, the issuing of rations, the wants of the schools, the enforcement of obedience to the local laws and rules of the reservation through the Indian police, and is responsible for the proper conduct of the whole of the complicated business of the agency. The employés at the Cheyenne and Arapahoe agency comprise a chief clerk and two assistants in the office at Darlington, two engineers for running two saw-mills, two carpenters, two blacksmiths, a wagon-maker, and five farmers engaged as instructors, and a large number of Indians, apprentices, drivers, herders, etc. The police force, divided into detachments at different stations, numbers thirty rank and file and three officers—a captain and two lieutenants—all full-blooded Indians, owning their horses and under regular pay, the officers receiving ten and the privates eight dollars monthly, and is composed of representatives of both tribes. The uniform, two suits of which are furnished annually by the government to each member of the force, is similar in cut and color to that worn by United States troops, and consists of a dark blue blouse, light blue trousers, and soft felt hat with a ribbon bearing the word "Police" in silvered letters. Officers and men are armed with revolvers, and are faithful and efficient, Mr. Williams, the agent, assuring us that they have never yet failed to make an arrest during his administration.

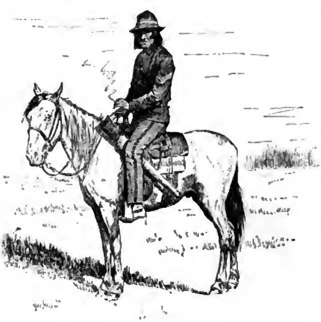
There are five sub-agencies at different points

---

[*] Mr. G. D. Williams, the agent at Darlington, in his report in August, 1887, says: "But a little over two years ago one-eighth of the entire force of the army was directed against the Cheyennes of this agency, who in large numbers were then opposed to any innovation tending toward civilization."



INDIAN FREIGHTERS.



A POLICEMAN.

on the reservation, each under a sub-agent, at the largest of which, Cantonment, an abandoned military post, one thousand savages are rationed. Four schools for Indian children, two of which are mission schools and two of which are maintained at the expense of the government, furnish education to three hundred and twenty red-skinned youngsters of both sexes, whose well-washed faces and clean clothing, their excellent discipline and apparent docility, as they sit behind the straightly aligned rows of desks in their schoolrooms, are in strong contrast to the bands of half-clad, painted, unkempt, and unmistakably unwashed little savages we have passed on our way over from the "post." But for an occasional untamed glitter of their bright black eyes and flash of white teeth in relief against the dusky hue of their faces, as they stand singing Sunday-school hymns for all the world like white children, it is hard to realize that any one among them had been born and attained the school age under the influence of savage life. The dormitories, refectories, kitchens, etc., are scrupulously clean, and the schools can bear favorable comparison with similar institutions in more populous and enlightened communities.

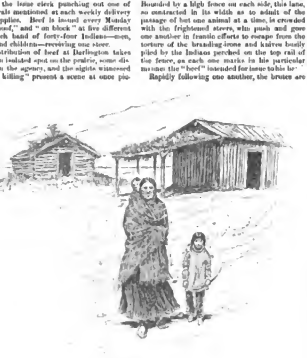
As already mentioned, a fixed sum is expended annually for clothing, etc., according to a treaty made with these tribes; and in addition to this, regular supplies or rations of food are distributed every seven days. This weekly ration consists of twenty-one pounds of beef, three and a half pounds of flour, half a pound of sugar, three-eighths of a pound of coffee, and a certain quantity of beans, salt, baking-powder, soap, etc., for each individual Indian. Heads of families are provided with tickets—running for thirteen weeks, and on which numerals representing each week are printed—which on presentation at the agency entitle the holders to their share of the groceries, the issue clerk punching out one of the numerals mentioned at each weekly delivery of the supplies. Beef is issued every Monday "on the hoof," and "on block" at five different points, each band of forty-four Indians—men, women, and children—receiving one steer.

The distribution of beef at Darlington takes place at an isolated spot on the prairie, some distance from the agency, and the sights witnessed at a "big killing" present a scene at once picturesque and exciting, if somewhat revolting to the finer sensibilities in some of its details. Long before the hour appointed for the slaughter of the animals and the distribution of the meat, bands of savages take up the march for the rendezvous from all points of the adjacent country. Wagons—sometimes of the newest and most approved patterns, at others the veriest rattletraps to be found on four wheels, filled with squaws and drawn by all kinds of teams, from the piebald, wall-eyed, pink-nosed ponies, to the patient and more or less broken-down mules, occasionally both horses and mules hitched to the same outfit—are crowded around the rough "corral" or fenced-in space on the prairie where the cattle are herded together, and over which, far up in the clear air, ragged-winged buzzards are circling. Mounted Indians gallop up, some armed with revolvers, others with carbines, and perched high up on the backs of their horses, ready for the exciting sport of pursuing and slaughtering the wild-eyed, long-horned Texan steers, that move restlessly about the narrow limits of the corral, bellowing nervously as if in dread anticipation of their doom. A fire is burning near by in which the branding-irons are being heated, and policemen and scouts, herders and agency officials, move about in the rapidly increasing crowd, busily preparing for the work of selecting and turning over the beeves designed for slaughter to the waiting Indian butchers. Descending from the "ambulance" in which we have driven over from the "post," accompanying the young officer detailed to be present at the "issue," we approach a rough log cabin, built close up to the fence, in which are placed the scales for weighing each steer as it is driven into the long narrow space connecting the corral with the gates out of which the brutes are liberated, only to fall victims to the eager savages awaiting them on the prairie. Bounded by a high fence on each side, this lane, so contracted in its width as to admit of the passage of but one animal at a time, is crowded with the frightened steers, who push and gore one another in frantic efforts to escape from the torture of the branding-irons and knives busily plied by the Indians perched on the top rail of the fence, as each one marks in his particular manner the "beef" intended for issue to his be-

Rapidly following one another, the brutes are released one by one through the gate opened at intervals by a nimble policeman, who frequently has to exert all his agility to escape the angry sideward thrust of their horns as the cattle rush through the narrow opening. Some of them dash frantically out over the plain, bellowing furiously and throwing up the dirt and dust with the sharp points of their cloven hoofs; others stop for a moment bewildered, foaming at the mouth and snorting with fear and rage, and then gallop away. Indians mount rapidly and start after, revolver or carbine in hand, and a regular hunt in all directions over the rolling prairie in front of us begins, as the maddened brutes vainly endeavor to escape from their ruthless pursuers. Jumping into the ambulance, we too drive out to get a nearer view, and we must confess that our participation in a sort of "Wild West" hunt in a "spring-wagon," instead of on horseback, is a decidedly novel experience to us, particularly as the Indians are none too expert as marksmen and are apt to shoot wildly, while an excited Texan steer has no respect for government ambulances or "special artists." However, our object is to "git thar," to use an apt Western expression, and to procure a good opportunity for making our notes and sketches, so, under the circumstances, our means of transportation is the best we could have desired.

Under the pitiless shots of the butcher the victim falls to the ground, and before its limbs have ceased to move in the convulsions of death, the hunter has dismounted, and the long, keen-bladed knife is plunged to the hilt in the still quivering body of the dying brute. With a yell the Indian signals to the squaws, who, urging their horses on, come rapidly out in their wagons from the corral, to begin the work of flaying and butchering. They swarm around the carcass with savage eagerness, and the tidbits, such as the heart, liver, etc., are quickly cut out, and sometimes devoured on the spot. Every portion of the "beef"—entrails and all—is used for food, and soon the wagons, loaded with huge lumps of still warm meat, drops of blood oozing through the cracks in their floors, move away from the scene of slaughter, and the buzzards flock down to gather up such stray bits—scanty fare indeed—as may have been left on the ground.

RUFUS F. ZOGBAUM.



A FARM-HOUSE.

"UNTO ONE OF THE LEAST OF THESE."

THE spirit of the kindly season is abroad, its genial influence brightening many hearts and lives, its cheery radiance penetrating gloom and darkness, its hearty greeting ringing out above the din and clamor of earth's many voices, "A Merry Christmas and a Happy New-Year!"

Alas for the homes where Christmas joys are never known! for the hearts which New-Year's cheer has never lightened! A glimpse of this darker side of life, from whose miseries even childhood is not exempt, is shown in our opening illustration. Two little waifs, homeless and weary, are nestled together upon the steps of a city tenement, seeking, it may be, to forget in sleep the restless cravings of hunger, and unconscious of the gentle spirit enshrouding their ragged forms, yearning to bestow upon them the aid which, without man's co-operation, it is powerless to grant. But the Christ-Child has not lived in vain, and recognizing through Him the claim of a universal brotherhood, we may look abroad at this joyous season, realizing that the artist's creative fancy typifies a great truth—that the brooding spirit of charity is ever near at hand, seeking from us that active sympathy and earnest effort which may comfort the sorrowing, feed the hungry, clothe the destitute, and give shelter and protection to the homeless and desolate.

Christmas-tide is passing, but the yule-log still smoulders, the Christmas garlands are yet green and fragrant, and the echoing strains of Christmas carols linger on the frosty air. May the spirit of Christmas shed its parting blessing on our hearts and lives, quickening them to truest service for our brother's welfare—a service for whose acceptance we have the assurance of Him who "spake as never man spake," with perfect knowledge and entire truth, "Inasmuch as ye did it unto one of the least of these, My brethren, ye did it unto Me."

FOREBODINGS.

MR. HELWICK's delineation of the young Irish girl in the picture on page 13 makes us feel his subject, for despondency and foreboding are expressed not only in the drooping head, the downcast face, but in every curve of the figure. Of what is she thinking as she sits with her empty "cleeve," or basket, thrown beside her, as if its usefulness as well as her own was over forever. Her eyes seem fixed on the old couple toiling in the distance, with so sad an expression in their depths that somehow it is borne in on us that she is contemplating a departure from her native land, and all she has ever known of home. Possibly they have fallen on evil days, the crops may have failed, so that they cannot pay the rent for the "bit of land," and are threatened with eviction at no very distant day from the little cabin in the background, where her young life has been spent up to this sorrowful moment. Perhaps she is solving the problem by determining to seek in the far Western country, whither so many of her young companions have already gone, her fortune, or at least a sufficient share of this world's goods to keep the old parents' thatched roof over their heads for the few remaining years of life.

The love of the soil is so strong in the heart of every true son or daughter of Erin that it is no alluring prospect to this poor child of nature to think of saying, in the words of her native poet Tom Moore:

> "Farewell to the land where in childhood I've wander'd,"

to feel that if she leaves the old father and mother it is probably forever. The heart of the child in the breast of the woman throbs with pain as she thinks of merry days past, of the rambles through brake and brier, searching for blackberries and wild flowers, and compares them with dreary days to come in the New World, where it will be toil "from early morn till dewy eve," and no "bit of fun" to lighten the sense of it. All the merry Irish customs, and the gatherings at wake, wedding, or christening, where the boys and girls spent the nights in innocent fun and frolic, dancing the hours away to the stirring sound of the country fiddler's (or piper's) jigs, reels, or hornpipes, are passing through her mind as she wonders how she will ever endure her life without those "little diversions" to lighten her labor. Who can tell if there is not some one nearer and dearer yet than either father or mother, whom the thought of parting from is the worst pang of all?

THE COPYIST IN THE LOUVRE.

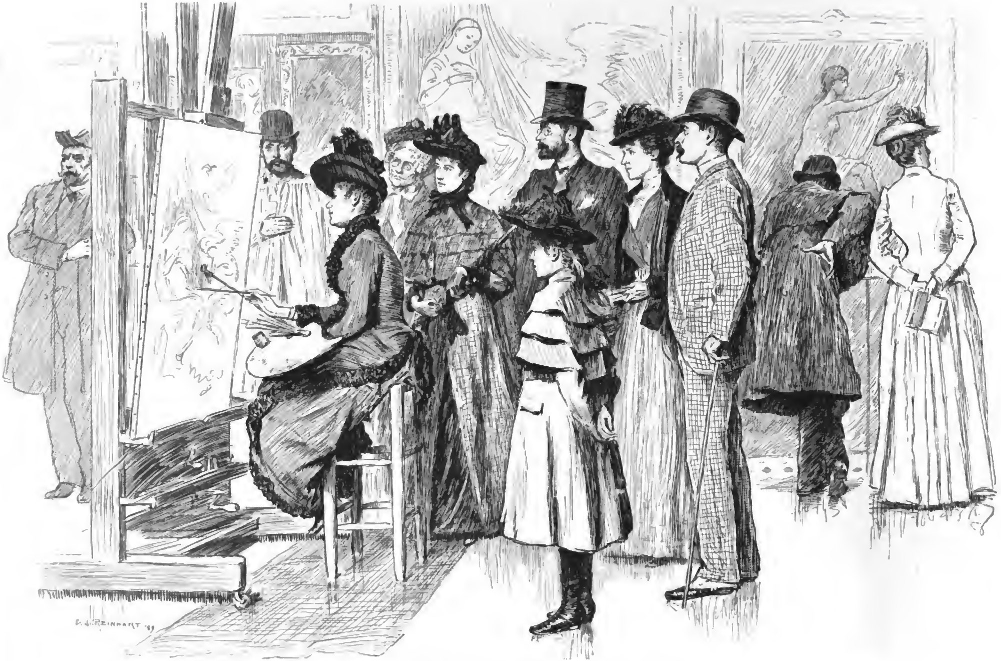
MR. REINHART's sketch represents a young woman, belonging to the artistic colony of Americans in Paris, intent on her work of copying a picture at the Louvre. Absorbed in her labors, she is utterly indifferent to the visitors at the gallery who may be looking over her shoulder. At the Louvre copying always goes on. At the École du Louvre easels platforms can be hired for a very small sum of the guardians. Certain pictures are special favorites, and permission to copy them must be obtained some months in advance. Copies may be divided into two general classes. For one kind the trade picture is the product. It is variable in quality; generally inferior, in an art sense. The color is imitative, the design followed, perhaps, with Chinese accuracy, but the sentiment of the work is not there. The true artist, the real one, copies the picture of some great master, and follows it out not only with his eyes and hands, but with his heart and soul. If he scrutinizes the subtle effects produced by the brush of the great artist of the past, he tries all he can to follow the exact mechanical applications of that brush. He subordinates himself to the difficult task before him. He is willing to lose his own individuality, and to merge himself in another's personality.

In France the calling of a copyist is by no means considered a derogatory one. Pupils of the École des Beaux Arts who have sufficient ability to win a first prize, go to Rome, and continue their studies there at the expense of the government. As a return for this art education they are obliged to produce some work of their own, and as often as not copies of celebrated pictures are made, and sent by them to Paris. These works are placed on exhibition every year in Paris, and if deemed worthy, remain in the école. By means of these copies there may be found in Paris a complete study of the development of art.

It is to be regretted that we as Americans are so little inclined to accept really good copies of old masters, and on that account offer such slight encouragement to our own artists. This is positive, that for much less than one-fourth of the money spent for pretended, or at best worn-out and valueless pictures, purported to be the works of old masters, good copies of great and well-known works could be obtained. American artists now working out their difficult careers in the various cities of Europe should find encouragement in the production of good and faithful copies. It need not be stated that a picture faithfully studied and copied is the best corrective for a loose way of painting, which our own people are prone to adopt. The necessity does not exist that only the painters of the sixteenth and seventeenth centuries should be copied. There is an abundance of works of art of a nearer period which afford ample material for study. As pertinent to the copying of modern pictures and their effectiveness, reference may be made to Couture's "La Décadence Romaine," now at the Yale Art School, so faithfully copied by M. Jacquesson de la Chevreuse.

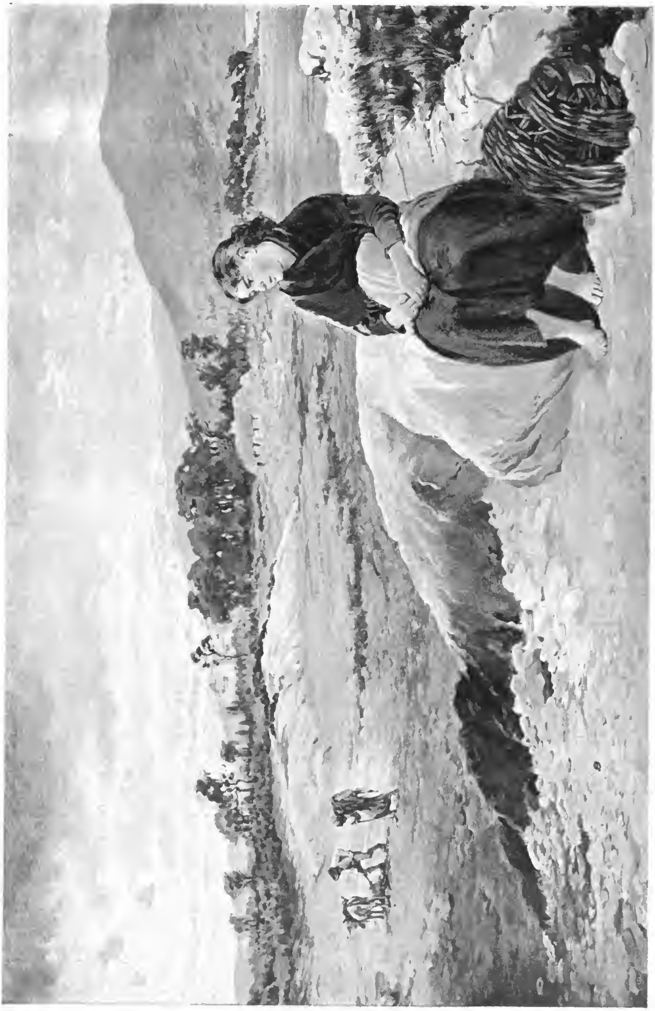
Just as a collection of casts after the antique becomes a public instructor, so must a gallery of good copies of the old masters serve the same excellent purpose. The merit of an original painting is insignificant if it be badly composed and indifferently painted. The copy of a great master if carefully worked out, though its force and beauty be borrowed, still exerts its influence, one which no other interpretation can give.

Directing more particularly our attention to Mr. Reinhart's sketch, the young lady who paints is an American, and she is surrounded in major part by Americans. That young person may have been born in Kansas, and have first shown talent in her sketches in school. She may have been highly lauded for her work, found a patron, and, adopting art as a vocation, is now steadily engaged at copying a picture in the Louvre. She may in time become the Angelica Kauffman or the Madame le Brun or the Rosa Bonheur of our future. She knows that to be imitative does not in the least shackle the true art impulse. To grind the colors, so she and all of us have read, was the work of many a 'prentice hand in the past, but that in time, little by little, imperceptibly, as it were, came that divine inspiration which made the unknown workman or work-woman the rival of the great artist. There may be heredity in art, but, after all, patient toil, long-sustained effort, "that infinite capacity of taking pains," alone tend toward the formation of genius.



C. S. REINHART '89

AMERICANS ABROAD—THE COPYIST IN THE LOUVRE.—Drawn by C. S. Reinhart.—[See Page 11.]



FOREBODINGS.—Drawn by Howard Helmick.—[See Page 11.]

"THAT WAGON OF OURS."

BY M. G. McCLELLAND.

I HAD been in the place about two years when it happened. It was a good place—with Cartwright & Co., dealers in wagons and agricultural implements. My employers were straightforward men, and treated their clerks with consideration, but, from the start, I made up my mind that I wouldn't permanently stick to the business. The fact is, my father and grandfather had both been doctors, and the love of healing was in the blood, so a doctor I was determined to be just as soon as I could save money enough for college expenses. There was nobody dependent on me, and when a fellow has his eye set singly on one goal he is capable of a good many personal sacrifices to speed the running. At the time I speak of I had five hundred dollars in bank, and was beginning to think—to use a bit of slang—that I would "get there" after a while.

One day, just about dinner-time, a mighty alert and masterful fellow, with a red mustache and eyes like a hawk, came into our place, and wanted to look at a wagon. We showed what we had in stock, and he poked and tapped and asked questions about hubs and axles as knowing as a farmer. Next day he came again, and he and Mr. Cartwright worked to terms for a good two-horse wagon, about the best we had in stock. The fellow was as smart as a steel-trap—which farmers usually are not—and I couldn't help enjoying the neatness with which he fetched our "boss" down to the lowest possible notch. It was funny, for Cartwright was accounted a shrewd hand at a bargain.

The wagon was to go to a young woman in the country, or, at all events, to a single woman, for the address the fellow gave me started with "Miss." The rest of it got mixed, through my carelessness, they said afterward, and came out differently from what was intended. I certainly set down the address as it sounded to me, and the afternoon of the day on which it was bought I started the wagon on its travels.

When a week had passed, in bounced the red-mustached fellow again, in a terrible temper, wanting to know "why in thunder that wagon had never been shipped."

Mr. Cartwright called me up, as I generally attended to the shipment of goods, and for a minute or two we had it backward and forward pretty lively. The wagon had not put in an appearance at the place where it was due, and the lady, after waiting and hoping for a season, had written to inquire the cause of the delay. The fellow with the red mustache at first was mad enough to lay for gore, but he cooled down after a bit, and we proceeded to locate the blunder. In about two minutes we found it. He had told me to send that wagon of ours to "Miss M. N. C. Vernon, Tarleton," and I had misunderstood him clear through, and shipped the thing to "Miss Mensie Vane, Tatters."

When I read this precious address out, Cartwright, who is a jovial man, laughed right out, and so did the other fellow, in spite of being aggravated.

"Where the devil is 'Tatters,' Mr. Jones?" my employer demanded.

"God knows!" I piously responded, feeling pretty sure that the matter was beyond human ken.

"You'd better pray for a revelation double-quick, then," Mr. Cartwright briskly announced. "That wagon of ours cost sixty-five dollars, and if you don't track it up and reship it inside of a fortnight, you'll have it to pay for. I can't have my goods, or my credit either, go to 'Tatters' through another man's blundering."

The pun was execrable, but it enabled Cartwright to end his sentence in a pleasanter tone than he had commenced it. There is something genial in a pun, and the worse it is the better humor it puts the man in who makes it.

For the next few days I had about as much wagon on hand as if I were conducting an emigrant train in the good old days of wagon supremacy. I breakfasted, dined, and supped with my mind hitched to that infernal vehicle, dragging it, or rather being dragged by it, from mountains to seaboard and back again. It was my daily thought, my nightly dream. I gridironed the State with telegrams. I haunted the depots and cross-examined the train-men until they could have gnashed their teeth with impatience at my persecution of them. At last I got hold of the conductor of the freight train which had carried the abominable thing away. From him I learned that the wagon had gone from one end of his route to the other, and found no stopping place, and that he, supposing that "Tatters" must be on some other line, had left it in the Central Depot to be transferred. He regarded me steadfastly as he made this statement, and remarked at its close that *he* had never heard of any place called "Tatters" in his born days. Was I positive that there was any such place in Virginia?

Of course I was not positive, and I told him so. Indeed, doubts as to whether there were such a place in America, or in the world, constantly obtruded themselves. For nearly ten days this "Tatters" had defied my best efforts at discovery, and it might, and in all probability would, remain a *terra incognita* to the end of time.

"That's a bad show for your wagon," the conductor observed.

And I agreed with him.

That fellow with the red mustache was nearly the death of me. If I heard the word *wagon* repeated once I heard it, on an average, fifty times a day, until I longed fiercely to expunge it from all spoken languages. Should the thing ever be recovered, I felt that the first use to which it might legitimately be put would be that of hauling me to an asylum. I was sorry for that young woman in the country too, waiting for her wagon, like the chorus in the old song. I knew, of course, that if that vehicle should not turn up, I would have to pay for it. The blunder had been of my making and must be of my mending. But I couldn't be satisfied to let the matter rest that way. Sixty-five dollars is a good lump of money to be docked from a clerk's salary; and besides, it looked ridiculous that so big a thing as a two-horse wagon could not be traced.

Matters were in this fix when an old chum of mine, a man I had not seen for months, came to town. He had been for years a drummer for a big dry-goods house, but had recently been taken into partnership and detailed to establish a branch house in a neighboring city. He was accounted the most thoroughly well-posted man on all matters of locality in his profession, and, indeed, was wont to boast that there was not a village in the State, comprising more than a chicken-coop and an empty tomato-can, in which he had not traded. From this friend I learned that there was a place called "Tatters," away in the mountains, almost on the borders of West Virginia.

There had been a sort of boom in West Virginia iron ore, and the D. and W. Railway had run a branch line across the mountains to tap the mining region. The new line had penetrated the heart of a wilderness, neglected since stage-coaching days, when an old turnpike had crossed into the transmontane by a gap, in which stood the village of Tatters. The settlement had dwindled to a cross-roads store, a blacksmith's shop, and half a dozen houses, and had not been deemed by the railway people of sufficient importance to justify a station and a regular agent. The trains would stop if they were flagged, or if they had goods or passengers to deliver, which did not often happen. Such local business as the company might acquire was intrusted to the village store-keeper, who also took charge of the infrequent freight.

This man, Sam Tatters by name, the drummer described as being a very square fellow; rather unsophisticated, as was natural, but shrewd in trade, and very honest and accommodating. Whether or not he had dealings with the "moonshiners" who infested the mountains thereaway my friend could not say, but he admitted that the bar was good for so sequestered a spot, and the liquor innocent of adulteration.

That the name which Sam shared with his village should have originated "Tatters" seemed unlikely; but cognomens are plastic things, and, in rustic mouths, capable of variation and even of reconstruction.

The more I thought about it, the more probable it seemed that to this place that wagon of ours had wandered. The drummer to whom I related the misadventure was of my opinion, and the more because this mountain branch of the D. and W. was part of the same system as the trunk line on which the wagon had started. Telegraphic communication with Tatters was impossible, and my friend suspected that the store-keeper was no scribe, since "high larnin'" was not a prerequisite to cross-roads store-keeping. The speediest way to reclaim our property, therefore, seemed to be to go after it.

In this view of the situation my employer concurred, and we arranged that he should give me the necessary time off for the management of the affair, and that I should pay my own and the wagon's expenses. This was satisfactory enough, and I departed on my mission in good spirits.

To a man who has been cooped up in town for more months than he can reckon on his fingers, a breath of the open is a pleasant thing, even though it come to him through a car window. The lift of the country mountainward, the variation and ever-increasing beauty of the outlook, the blue of the sky, ribboned, toward evening, with clouds shaded from softest gray to delicate pink, like mother-of-pearl; even the fields of broom-sedge and scrub-pine, the brier patches and tangles of sumach and sassafras bushes, bound together with ropes of Virginia creeper and wild grape-vine, took on the beauty and allurement of the unaccustomed. I watched it pass in ever-varying panorama in a beatified state of enjoyment, which prevented even that tarnation wagon from rolling in on my memory and spoiling everything.

The journey occupied a good many hours, and it was somewhat over the edge of dark when we reached the village of Tatters. The train slowed up, deposited me on what looked to be the side of a ditch, and swept away with a wild toot-toot of exultation. There was no moon, and coming from the lighted car into the dimness of starlight blinded me, so that I stood and peered about, blinking like an owl abroad in daytime, but from a different cause. The ditch might be dry enough for passage, or it might not; the chance was even either way; and as my eyes grew accustomed to the dusk I fancied I could distinguish phantom-like poles and switches, which I took to be cat-tails and willow scrub. With the vision of a bog before my eyes I shunned unprecedented methods, and poked about for an authorized plank or crossing log. While thus engaged a voice from the other side of the ditch shouted out, "Hoo-roo!" with a volume and suddenness that caused me to jump aside and wellnigh tumble into the danger I was seeking to avoid.

This Southern style of halloo, with its long-drawn cadence, was familiar to me; so I answered in kind, and proceeded in the direction of the voice. Presently a moving substance, distinguishable from the general dusk by its greater density, appeared on the village side of the ditch, and held parley.

"Did the train put off anybody?"

"Yes."

"What sort?"

"A man."

There was a chuckling laugh, and then the voice went on:

"That war a fool question, warn't it? Arter I'd heard you holler, too. Your notes war keen as a kildee's, but ther war a man ring to 'em. What are you arter, anyhow, stranger, comin' in this time o' night?"

This I explained was the fault of the corporation, not of the individual. I further intimated that my first desire was to cross the ditch dry-shod, and after that to procure lodging for the night.

The explanation appeared satisfactory, and my interlocutor passed from inquiry to direction. There was only a thread of water at the bottom of the ditch, he said, but there was a plank across it farther along. I might journey toward that, or expedite the transit by a "squar' jump" from where I stood. The latter mode commended itself, and I crossed my Rubicon at once. The mountaineer, who had moved aside to give me landing room, chuckled again.

"You jump as keen as a catamount, stranger," he commented. "I e'en-er-most dodged double whenst your wind struck me. Look like ther darkness had bunched together an' flung forred."

At his invitation I followed him along a narrow path, which, after a few yards, merged into a country road. He had a store close by, he informed me, and would accommodate me for the night, since "thar warn't no bo'din'-houses nor yet no hotels in ther gap."

"You are Mr. Tatters—Mr. Sam Tatters, I suppose." The observation savored of assertion, and was intended to help the acquaintance on to a sound basis.

"I reckon so." Then, with more assurance: "Yes, thet's me. How come you to ketch on to my name, seein' you be strange to these parts?"

I hastened to mention my own name and that of my friend the drummer, and by the time we had reached the store we had grown quite sociable and chummy. The building was a log structure, weather-boarded, and divided into a long room with shelves and counters containing the usual assortment of miscellaneous merchandise, and a smaller room at the back, in which were the proprietor's bed and a little railed-in space which served as a bar. There was a table in the middle of the room, already laid for supper, and in the great fireplace burned a noble fire of oak and hickory. As we entered, a negro woman came in also, through an outer door, with a dish of broiled birds and a pot of smoking coffee. In compliance with my host's request, I took off my overcoat and made myself comfortable in the ingle nook. It was October still, but the nights were chill, and, in the mountains, cold enough for frost. After supper we drew to the fire, and the negro woman cleared off the table, lighted a dingy kerosene lamp, and departed. My host was a bachelor, he explained, and reduced to hired female attendance. He preferred his old corn-cob pipe to the cigar I offered him, and, for a time, we smoked in the ruminant silence which accompanies rustic consumption of tobacco after a full meal. To ears habituated to noise, the silence outside appeared almost unnatural; there was no wind astir, so that even the sound of its murmur among the trees was absent. My hearing, involuntarily strained for the relief of sound, grew preternaturally acute, and after a little I could distinguish the barking of dogs at a great distance. The expression of my face must have indicated intensity, for Tatters noticed it, and inclined his own ear, inquiring if I heard anything.

"Only dogs barking, away in the mountains somewhere," I made answer.

A slow smile wrinkled the corners of my companion's eyes and softened the curve of his lips. His face gained by the change of expression. It was a rugged face at best, with the aspect of having been roughed out but never finished; but the eyes were kindly, and there was a look about it which inspired confidence. To drop into the vernacular, he looked a man to tie to.

"Them's Ted Holly's dogs," he observed. "He mostly travels with two or three to heel, an' that thar big spotted hound o' his'n have got a ring to his music what's unmistakable. Ted's comin' over ther mountain to see his sweetheart. She don't live more'n a mile from here. Thar weddin's sot for Thu'sd'y week. Mensie have give in to marry him sence that thar wagon come an' helped 'em out'n ther mire some."

My attention was at once arrested, and the subject which had dominated my thoughts for days, held in abeyance for the nonce by physical comfort, trundled briskly to the front again. The name "Mensie" in connection with a wagon suggested discovery, and also complications. I hadn't conceived of the possibility of a woman being ticketed with a name so senseless until the initials given me by the man with the red mustache had jumbled into it. Here was a coincidence worth investigating. Before bursting into questions, however, I proceeded to put the matter in shape by briefly stating my business at home, and recapitulating the blunder which had necessitated my visit to this region. The attention with which my statement was received and the interest aroused by it might have been flattering could I have believed either evoked by anything personal. But my audience had no thought of me in the matter. His mind was filled with other images, and his expression was perplexed and decidedly regretful.

"What sort o' wagon did you say 'twas?" he queried when my tale was done.

I redescribed it. He nodded twice or thrice, and beat with his pipe against his knee, as though making an inward comparison and checking off items.

"Did it come here?"

The question really appeared superfluous. I was convinced that it had.

Tatters avoided a direct reply at first, and went over my description.

"Two-hors' wagon, mighty strong and serviceable, ironed heavy for rough travellin'; painted green, with red wheels, an' a red line around ther aidges o' ther body. Had a patent brake too, an' a spring seat, an' things conformable. An' a kyard tacked on ther rump end o' ther tongue, marked to 'Miss Mensie Vane, Tatters.' That's so! Yes, siree! thar ain't no crawlin' round them facts. It's a pity too! Blamed if it ain't!"

I couldn't see it in that light. To me it was a matter of jubilation. My soul had been vexed within me because of that wagon, and my joy in its recovery was proportionately great. As delicately as I could I intimated that, to me, outside regret seemed superfluous. Then I demanded information as to the whereabouts of the property.

Tatters met my glance with a meditative sort of smile.

"Ride easy," he said. "'Tain't far off, an' you can't do nothin' with it to-night. It's safe enough, an' 'tain't dirtied none to hurt, I reckon. It come here week afore last; but sorter late—long about Friday or Satday. That's been mo' mistakes about that wagon en what you made. Yourn led off an' t'others follered suit. That's how come I'm so tarnation bothered."

A vision of our nice new vehicle mud-splattered and dingy arose before my mind's eye. There had been heavy rains the previous week, and for badness mountain roads are proverbial. From the store-keeper's words I inferred that our wagon had been given opportunity to become acquainted with them. The impudence of some fellow's coolly hitching up and pranking about the country with our property, injuring and befouling it, made me hot all over. In a few forcible words I gave Mr. Tatters to understand that, as freight agent for the place, I intended to hold him responsible for damages. He had no business to let the property out of his keeping.

"I dun'no' how come I hadn't," Tatters retorted, nettled in his turn. "Ther blamed thing war 'rected to 'Miss Mensie Vane,' plain as an axe helve, warn't it? An' Miss Mensie Vane lives just round ther shoulder o' the mountain, an' I sont her word ther wagon was here for her, an' she come over an' paid charges an' toted it off. If that warn't a straightforred transaction, I dun'no' one when I see it."

The way he put it certainly gave it that appearance. Here were complications with a vengeance, and a promising prospect for more delay and annoyance. It was bootless showing temper to Tatters, however, since he was, apparently, in no wise in fault. The better part of wisdom would be to possess myself of particulars, so that I might thereby regulate my future movements.

The story elicited was this:

About a mile distant, through the gap, there lived a family by the name of Vane, indigenous to the soil, and tracing occupancy of a sterile little hill-side farm back to the days of pioneering. By natural disintegration, brought about by thriftlessness in some of the race and enterprise in others, the family in those parts had dwindled to an oldish man, maimed during the war, and gradually reduced to sightlessness by cataract on both eyes; a single daughter of eighteen, his youngest and sole remaining child, and a brood of grandchildren of tender years, the progeny of a son and daughter-in-law, both deceased. This John Vane appeared a very Murad for ill fortune. He was a weakly man in constitution, and never avid of exertion, and he had married a woman of mournful temperament. John was one of twins, and the rural superstition runs that should one of a pair of twins prove exceptionally successful, the average will be maintained by the other one's being unlucky. Jim Vane, the fortunate twin, had remained in lower Virginia after the declaration of peace, and settled in the tide-water region, where he had done very well for himself.

In his old home, this was known by hearsay, for, as years went by, the brothers had drifted more and more apart. They were both averse to that which they denominated "ramblin'," and being uneducated men, were debarred from intercourse by letter. They "sont word" to one another from time to time, and once Jim had come home on a visit. But that had been before his marriage, and John had never returned the civility, being tied at home by many cares and little stamina to grapple with them.

His daughter Mensie seemed to be cast in a different mould; doubtless one of those reappearances of the best in a race which usually presages a turn of the tide. From Tatters's account she was a handsome, high-spirited girl, with plenty of sense, plenty of pluck, and a loving heart of her own, to all of which the neighbors were willing to testify. After the death of her "slack-twisted" mother, a couple of years before, she had taken the family in charge and upheld them to the best of her ability.

That Mensie had a lover goes almost without telling, for, if a woman be tender-hearted and loyal to her own, some man is sure to find it out and seek to appropriate the treasure. Ted Holly, the "likeliest fellow" in the district, according to Sam Tatters, had watched the girl at her gallant task, and conceived the notion that it would be a pleasant thing to help her.

But Ted was as poor as a broom-sedge field, such patrimony as might have accrued to him having been converted into liquor and poured down the throat of a vagabond father long ere he attained to manhood. He owned a horse, however, and a stalwart pair of arms, all of which he placed at his sweetheart's disposal. Mensie engaged herself right willingly, for she loved him well; but for that very reason she steadily refused to accede to his proposal to marry him straight out of hand. The man who should wed with her must assume the burden of her family, she said, and there were so many of them. She could not bring her mind to it all at once. After a while the children would be larger and could help themselves a little. They had better wait awhile.

Among their scanty possessions the Vanes owned a colt, now three years old and being broken by Ted to harness. Its dam had died soon after its birth, and Mensie had reared it on a bottle, like a foundling infant. It was a sturdy, well-grown brute, and with Ted's sorrel formed as good a team as a man need want to shake his lines over. If only they could get a wagon now, Ted said, and Mensie would consent to marry him, their fortunes would begin to mend.

For with the opening of the ore banks across in West Virginia there had come a fine opportunity for making money. With a wagon and his good team, Ted figured out, he could make enough in a week, hauling ore for the company, to support the family for a month. There would be no necessity to wait until nature should lift the children into self-support. Ted could take care of them all as easy as rolling off a log.

He hesitated about going in debt for the coveted vehicle; first, because he knew no man who would trust him for the purchase-money, and then because he had observed that debts were prone to grow and devour a man's substance. His sweetheart dreaded debt, moreover, and held it a sorry foundation whereon to establish wedded happiness.

Then, just as their longing reached high-water mark, and the business opportunity seemed fairly to thrust itself upon them, this wagon of ours had come blundering along, marked with Mensie's name, and apparently intended for no other human being. Sam Tatters, who of course knew all about their plans and longings, being fond of them both, and moreover the repository for local gossip, was overjoyed at Mensie's luck. He sped a messenger in haste to summon the girl to behold this wonder, for he had no mind to deliver the wagon to any one else, and so lose the sight of her face when she should read the label. But Mensie had no grain of faith in a happening so unprecedented. It was one of Sam Tatters's foolish *jokes*, she said, for Sam was proverbial for jesting. She stuck to her spinning, therefore, and sent Ted Holly, who chanced to be on a visit to her, down to tell Sam that she was too wary a bird to be trapped with chaff. Holly, in no very credulous frame of mind himself, stepped along to the village with the message, and there to his wonderment beheld in Sam's store-yard a strong new wagon, as handsome as clean iron and paint could make it. He spelled out his sweetheart's name on the card fastened to the tongue, and then, with scarcely a word to Sam, leaped over the fence at the corner nearest the road and sped back through the Gap to fetch Mensie and the horses.

"He jumped up ther hill-side like a hopper-grass," Sam narrated, "an' I don't b'leeve he tetched ground more'n every six foot, or such a matter. It's a steep hill-side too, an' rough as the devil. Ted didn't keer, though. Lord bless you! he never knowed whether 'twas gravels or velvet under his boots, he was in such a swivet. In a little while here he come back ag'in, an' Mensie with him. She was trimblin' all over like a wind-shook saplin' for joy. An' whenst she seed that thar wagon standin' thar as natu'l as preachin', an' read her name on ther tongue, an' 'lowed for certain 'twas hern, the tears come right up in her pretty eyes, an' she laid her head down on the nighest hind wheel an' cried like a baby, an' maybe said her pray'rs over it too, like women will when anything goes all over 'em. An' right then an' thar she told Ted he mout git the license as quick as he had a mind to, bekase this here wagon was agwine to haul the whole bilin' n' 'em out the ditch."

Tatters paused in his story, and gazed into the fire. I followed his example, and there was silence for a moment.

"They'd fetched the chil'en along, too; all seven o' 'em, stuck on the horses from neck to tail. Them leetle creeters dodged about like pa'tridges, so pleased to have a frolic an' ride home in the new wagon. I lent Ted some harness to help out with his'n, an' helped him hitch up. Most all ther folks had come out to see 'em start off, an' to pass jedgment on the wagon, an' rej'ice with Mensie over her luck. She's mightily thought of by the naybors, Mensie is. Whenst they started off, Ted holdin' ther lines as proud as a candidate what have poled a majority, an' Mensie settin' up beside him so pretty an' satisfied, an' that coopful o' chil'en stored in behind, I 'lowed 'twas e'en-ee-bout the happiest wagon-load I'd seed for a month o' Sundays."

He sighed as he smiled. It seemed dreadful that this joy must be turned to mourning. I felt like a brute, but tried to harden my heart. After all, it was not *my* wagon.

"Did none of you suspect that there might be some mistake?" I questioned. "Whom did you suppose had sent the wagon?"

"Well, you see, thar was Mensie's Uncle Jim down the country. He is well off, an' we all know'd it. Ted an' I sorter figured out that the wagon come from Jim. I reckon 'twas his being John's twin made us pitch on him so straight. It looked natu'l for *twins* to help one another, an' seem like they ought to *feel* the right way to do it. Then, too, one of the neighborhood fellows had gone down to the low country a month befo' to see some kinfolks of his own, an' we 'lowed he mout have run across Jim an' told him about Ted and Mensie. Everybody know'd what thar desire was. It looked sensible to think Jim sent it."

"Did his niece think so?"

"Who—Mensie? I dun'no' what she thought at fust. I don't b'leeve she thought nothin'. She was so broke all to pieces by the thing comin' to her so sudden, jest in ther nick o' time, you may say, that she couldn't do much but rej'ice an' cry an' say her pray'rs over it. I axed her if she didn't reckon her uncle Jim sent it, an' she just looked at me out'n them pretty eyes o' her'n an' made answer, right easy, like a person speaks in church, 'Maybe so; but I hadn't thought o' that. It looked to me like 'twar God A'mighty sent it.'"

My eyes sought the fire again, and I am not ashamed to confess that they saw double. The more I contemplated the job I had in hand the less I liked it, and the more inclined I felt to dodge it altogether. It seemed downright cruelty to take the girl's wagon from her. In my heart I regretted that Tatters was not still the *terra incognita* it had once appeared.

The fire had burned down to a bed of coals. Sam rose and laid fresh wood on it, and then passed into the outer room. I could hear him open and close a drawer, and shuffle about among the goods as though he were looking for something. Presently he came back and reseated himself beside the fireplace.

"It do look a pity to disapp'int her, now don't it?" he queried—"'specially arter the thing had her name on it so plumb. I dun'no' how you come to run up agin that name nohow. 'Tain't a common one, I reckon."

Certainly *I* had never heard it until I made that blunder in the address.

Sam pondered: "She 'lowed God A'mighty had took notice 'special," he mused. "Ef things turn out dif'ent 'twill feel 'most like He'd gone back on her, an' a notion like that would hurt a woman. They git a sight o' comfort out'n the idea that Providence have got a contract to look out for 'em an' stands to fill it reg'lar." He lapsed into silence; then, with an abrupt change of voice and expression, turned to me with the question, "How much is the blamed thing wuth anyhow?"

"Sixty-five dollars was what it had sold for," I told him.

He reached down into his coat pocket and produced a small shot-bag, which he emptied on the table in front of him. It contained the month's accumulation of his cash drawer, in small notes and fractional currency. He counted it, replaced it in the bag, and pushed it over toward me.

"Thar's thirty," he announced, "an' I'll send you the balance inside o' six months. The stock in t'other room will kiver it ten times over. I'll give you a lien on it to-morrow, seein' you don't know much about me. Is it a bargain?"

I stared at him. This summary disposal of the business flustered me. I explained that the wagon was not my property, nor even that of the firm I represented; that it belonged to a young woman down the country, who had paid her money and been kept out of her goods for a matter of six weeks.

"The firm won't keer," urged Tatters; "they'll be makin' by the trade. I'll take this stray wagon an' pay for it, an' they kin send t'other young woman another one. You all have got plenty, I reckon, as good as this, an' better. The young woman ain't never seed this one nohow. A wagon is all she's arter, an' so she gits a good one, an' her money's wuth, she'll be satisfied. The *firm* will be rej'iced—sellin' two wagons 'stid o' one. Why, I shouldn't wonder if they put you on the road reg'lar arter this to drum for 'em." He laughed delightedly, and thrust the money over nearer to me.

Then his expression changed again.

"Ther thought o' that pore gal's satisfaction gittin' sp'iled gripes me," he affirmed; "it's hard luck to ketch holt o' happiness an' then have to turn loose. It's wusser 'n if you hadn't never got in sight o' it. I'll fix up 'long o' Ted 'bout my money if you'll humor me. You kin look to me for your'n."

Sentiment is contagious, so of course he had his way. In truth I had no wish to arrange the matter otherwise. I knew I could make it all right with the firm by planking up the sixty-five dollars, and I did not mind making up the deficit and waiting on Sam Tatters. I knew I could trust him. As for the young lady, there were most excellent wagons in stock as good as this one, which could be shipped to her as soon as I got back.

My confidence in Sam was not misplaced, for before the expiration of the six months agreed upon the balance of the purchase-money was paid over. It came down by express in another shot-bag, and was accompanied by a note from Tatters stating that Ted and Mensie had been married the week following my visit, and were well and happy, with good prospects of success in the hauling business. He and Ted had fixed up matters satisfactorily between them, but had agreed to keep the practical part of the matter a secret from Mensie. It pleased her so to call the wagon "a gift o' God."

And after all, perhaps, it had been.

M. G. McClelland.

RONDEAU.

The greater grief is still to know
That though the newer seasons burn,
The sweeter past will ne'er return;
That morn, with roses all ablow,
Must lose its dew in noontide's glow.

Shall love ne'er stay, but ever grow
Into a past, and ever slow
Through chaplets fresh to souls that yearn
The greater grief?

O sweet the song in moonrise glow!
The lingering till the moon hangs low;
The first faint signs by which we learn
The night to day begins to turn.
Ah, these were sweet, did we ne'er know
The greater grief!

R. T. Strouts.

THE AMERICAN MILITARY ATTACHE.

For the first time in our history the government has let loose upon the military countries of the Old World about a dozen United States officers, all of them paid to discover as many professional secrets as possible, and report them to the War Department in Washington. A few of these amateur diplomats have seen as much as a whole company of troops together at a time; most of them are graduates of West Point.

We may assume that these gentlemen were selected by the head of our army because of the special fitness each possessed to ingratiate himself in the affections of the country whose military establishment he was to investigate. Such information here, and particularly in Germany, Russia, France, Austria, and Italy, is given as a matter of favor, and the one who gets the most information is the man who impresses most agreeably the authorities in charge. The Englishman who comes to inspect our torpedo establishments at Willet's Point or Newport may hear and see a great deal if he is the right man, and on the other hand may return home with little more than a view of the buildings if the officers in charge fail to interest themselves in him.

Of course international courtesy demands that when a foreign officer applies through his legation for permission to see the usual sights, such as the arsenals, the war schools, the naval stations, etc., the government grants it to him, and he is furnished with an attendant who shows him about. But this attendant shows him no more than he shows any civilian, although the military visitor may be received with more ceremony. The valuable information which a United States officer may be expected to gather while abroad is the result not of being led about like a tourist through government buildings alone, but of having familiar intercourse with military specialists; and to succeed in this our representative must be in a position to meet foreign officers on their own ground, must not merely try to catechise them after the manner of a "reporter," but so interest them in discussion that the information sought for shall issue spontaneously and freely.

Commander Chadwick, of the *Yorktown*, while naval attaché in London was of very great service to our Naval Department by the large quantity of precious information he supplied during the planning and building of our new war ships. He knew his trade thoroughly before going abroad, was familiar with foreign languages, and had a rank in the navy that commanded respect amongst his professional colleagues, if that were not made superfluous by his reputation for scientific ability. No doubt the success with which Commander Chadwick served his country inspired our War Department early in the spring of 1889 to attempt the same thing on their own account; but not having taken the precaution to secure the advice of any competent person beforehand, they have succeeded in doing as much mischief as good to the reputation of our army in general, and West Point in particular. The dozen young men originally let loose upon Europe were accredited to no particular country, nor were their fields of investigation in all cases clearly defined; they simply had orders to travel about, keep their eyes open, and pick up what they could. They might all happen on the same day to inspect the same arsenal, or on twelve successive days, or might ignore it altogether. No country was bound to recognize them, as they came accredited to no particular country, and Captain Zalinski, who happened to rove in Germany about the time of the grand manœuvres and the largest trials of smokeless powder, could not even get official recognition for the purpose of seeing them as a United States officer. And if this happened in the case of a military inventor so well known abroad as Zalinski, what must the mortification have been in the case of others of less name?

The absurdity of the government's action in regard to our officers began to appear very soon, and in spite of the fact that our minister in London, Mr. Lincoln, had, as Secretary of War, declared military attachés to be unrepublican, and therefore impossible for us, we concluded to attach some of these rovers to different legations, and call them by the odious name of attaché. To Germany, the most military of countries, where we needed the man of longest experience, of highest rank, and greatest military knowledge, we sent one whose only experience of war since leaving West Point was in the blasting that accompanies engineering works. He did not know how to ride, and was regarded by his classmates at West Point as a phenomenon by reason of the facility with which he and his horse had been known to part company. As the most conspicuous work of a military attaché is on horseback, in company with the representatives of other countries, it is of course well that our country be represented by one who can stick to a moderate animal. I had the mortification in Germany of seeing for the first time in my life a West Point graduate pitched on all-fours over his horse's ears; then, later, to see the same officer holding himself on horseback by means of the animal's mane, and a pair of glittering but gory spurs; and finally to see German soldiers, by order of a German officer, unstrap these same spurs from this United States officer in the presence of the military representatives of the rest of the world. Nor did our representative venture to wear spurs again during the following week of manœuvres. This same representative did not know enough of either French or German to converse easily with any of his colleagues, except the English one, and had he possessed this fluency he would have been but little better off, for his rank and attainments made him as much of an outsider in the midst of those with whom he was thrown as a law student would be in a committee of judges.

Germans, who look to our army with respect, and who study the careers of Grant, Sherman, Sheridan, McClellan, Lee, Schofield, and our other great leaders with a critical attention beyond anything dreamed of in our service, expected, and not without reason, that America would send them as military representative some one who had seen one civil war; if that were impossible, then some one who had seen fighting amongst the Indians; if that, even, were impossible, then at least some one who had commanded troops, if only a company or two. Instead of that, we pick our representative from the engineers, a force that knows no more of the army as a fighting force than a stoker does of handling an iron-clad. We sent a major to London, a captain to Vienna, but to Berlin we could only spare an engineer officer!

Our action, too, compared unfavorably with that of other powers, and gave Germany reason to think that we looked upon her less favorably as a military power than the rest of the world. I will only mention the States represented at the grand manœuvres, with the rank of their military representative, adding by-the-way that they were almost without exception men of distinction as soldiers. Bavaria, major-general; England, colonel; Saxony, colonel; Austria, colonel; Russia, colonel; Spain, colonel; Chili, lieutenant-colonel; Würtemberg, major; Argentine Republic, major; France, major; Italy, major; Japan, major; Sweden and Norway, major.

No nation that sent a single representative ventured to send one as low even as a captain, and it was left for us to bring up the tail of the procession, a long way behind Japan, Argentine, and Chili, nations that have no more reason than we for being represented at all.

Since the grand manœuvres of 1889 the United States lieutenant has been relieved on account of ill health, and another engineer officer, with the rank of captain, sent to Berlin in his place. We assume that he knows German and French fluently; that he can keep his seat in the saddle; that he has tact in securing information from unwilling witnesses; and is familiar with foreign military organization and resources. At West Point he is credited with having gained his military knowledge principally in superintending the erection of houses and other innocent structures for the government. This seems incredible, for if it be true he cannot be as well equipped for discussing war implements as a man who has handled such implements in actual fight. German officers are, as a rule, highly cultivated students of the art of war, and such of them even as have not seen service will still discuss battles of our civil war with a precision of detail that would astonish the best-read member of the West Point mess. They want us to send them a soldier, a fighting man, some one like Captain Burke, a genuine Indian fighter, whose experiences are valuable, and with whom it would be a pleasure to compare notes. Men of like character would command respect amongst the best soldiers of Europe, but to send an engineer who is not a fighter—why not send a paymaster or surgeon?

While speaking of what a military attaché should be and should not be, we had almost overlooked the several shivering "roving commissioners" who are "doing" Europe as well as they can, and receiving the cold shoulder everywhere. The granting of roving commissions to our officers is, as a rule, absurd if not mischievous, and should only be done in very rare cases, when the government makes it clear that the information sought is of such a nature that the ordinary attaché cannot treat of it. As a rule, it may be argued that if our regularly appointed military attaché cannot get the information desired, he had better be superseded by one that can. Last summer, for instance, Lieutenant Sanford was our military attaché in Berlin, while at the same time Captain Zalinski was, in a manner, poaching upon his preserves by industriously visiting the military establishments which his junior colleague either had visited or was about to visit. I know of five officers at least who have been treading on one another's heels about Europe last summer, each interfering more or less with the others' work, and, needless to say, incurring unnecessary expense for our government.

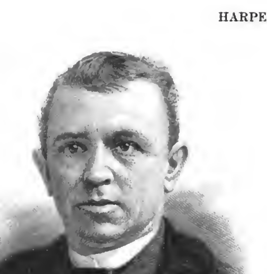
No army in the world has a corps of officers who, in proportion to numbers, has shown more courage in the field or greater scientific ability than ours. We have men admirably fitted to represent this army at any court of Europe, not only by their fluency in modern language, but by their rank as soldiers. Frank Vinton Green, who represented our army in the Russo-Turkish war, and whose report is a model military document, has left behind him in St. Petersburg most pleasing memories of a gallant and talented American officer. The fact that he went there as an engineer, and only a lieutenant at that, made his early efforts the less pleasant, to be sure, and any less able man would have fared poorly at that court. But with proper rank, and from the proper arm of the service, why cannot our War Department look up more men of that kind—they can find them if they look well—and they surely do not wish to be blinded by favoritism.

Poultney Bigelow.

HENRY WOODFEN GRADY.

Mr. Grady, whose untimely death occurred December 23d, was in many respects the man whom the South could least afford to lose. More than any other Southerner he had the attention and sympathy of the North. He had become the messenger of his people, and his eloquent assurances of their patriotism and loyalty, fortified as they were by a general faith in his own honesty and sincerity, were of incalculable effect in stimulating the growth of trust and affection between the two sections of the country.

Mr. Grady made two notable speeches in the North, one in 1886, at the annual dinner of the New England Society in New York, and the other recently at a dinner of the Merchants' Club of Boston. The last was a most striking appeal to the North against proposed oppressions of Southern whites under the mistaken notion that the blacks are to be thereby helped into power. It seems now as if it were a voice from the grave, for Mr. Grady was suffering from the cold which resulted in his death when he started from his home in Atlanta. It was contrary to the advice and urging of his family that he made the journey. His illness increased as he went on, but he seemed to feel particularly impressed with the thought that he had a message to deliver in Bos-



THE LATE HENRY W. GRADY, OF ATLANTA, GEORGIA.

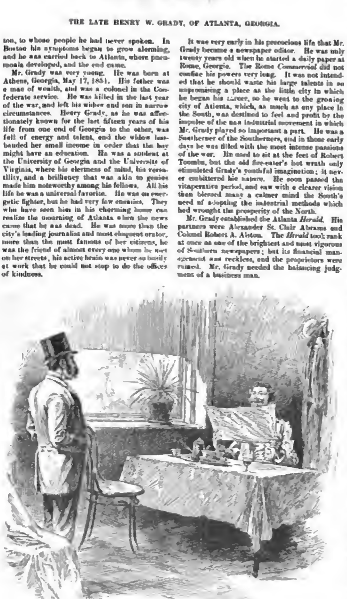
ton, to whose people he had never spoken. In Boston his symptoms began to grow alarming, and he was carried back to Atlanta, where pneumonia developed, and the end came.

Mr. Grady was very young. He was born at Athens, Georgia, May 17, 1851. His father was a man of wealth, and was a colonel in the Confederate service. He was killed in the last year of the war, and left his widow and son in narrow circumstances. Henry Grady, as he was affectionately known for the last fifteen years of his life from one end of Georgia to the other, was full of energy and talent, and the widow husbanded her small income in order that the boy might have an education. He was a student at the University of Georgia and the University of Virginia, where his alertness of mind, his versatility, and a brilliancy that was akin to genius made him noteworthy among his fellows. All his life he was a universal favorite. He was an energetic fighter, but he had very few enemies. They who have seen him in his charming home can realize the mourning of Atlanta when the news came that he was dead. He was more than the city's leading journalist and most eloquent orator, more than the most famous of her citizens, he was the friend of almost every one whom he met on her streets, his active brain was never so busily at work that he could not stop to do the offices of kindness.

It was very early in his precocious life that Mr. Grady became a newspaper editor. He was only twenty years old when he started a daily paper at Rome, Georgia. The Rome *Commercial* did not confine his powers very long. It was not intended that he should waste his large talents in so unpromising a place as the little city in which he began his career, so he went to the growing city of Atlanta, which, as much as any place in the South, was destined to feel and profit by the impulse of the new industrial movement in which Mr. Grady played so important a part. He was a Southerner of the Southerners, and in those early days he was filled with the most intense passions of the war. He used to sit at the feet of Robert Toombs, but the old fire-eater's hot wrath only stimulated Grady's youthful imagination; it never embittered his nature. He soon passed the vituperative period, and saw with a clearer vision than blessed many a calmer mind the South's need of adopting the industrial methods which had wrought the prosperity of the North.

Mr. Grady established the Atlanta *Herald*. His partners were Alexander St. Clair Abrams and Colonel Robert A. Alston. The *Herald* took rank at once as one of the brightest and most vigorous of Southern newspapers; but its financial management was reckless, and the proprietors were ruined. Mr. Grady needed the balancing judgment of a business man.

He then, in 1876, became the Southern correspondent of the New York *Herald*, and his letters made a strong impression. He wrote also for other Northern newspapers, notably for the war series that appeared in the Philadelphia *Times* in 1880 and 1881. In 1876 he watched the count of the electoral vote in Florida, and made an affidavit that Tilden was elected. He followed up the matter in Washington, and in the spring of 1877 published the confessions of fraud made to him by Dennis, McLin, and Cox. In 1880 Mr. Grady bought an interest in the Atlanta *Constitution*. The property has greatly increased in value under his editorship. It has been a strong, vigorous local paper, and its treatment of national questions has been effective. It is a curious commentary on Southern journalism that at the time when prohibition or license was the issue in Atlanta politics, Mr. Grady wrote "dry" editorials for his newspaper, while Mr. Howell, the other editor, wrote "wet" editorials in the same issue, each signing his article.



ANOTHER IDIOTIC QUESTION ANSWERED

"Hello, Jones! You back from Paris?"
"No, not yet. I'm at present dining on the Boulevard. Won't you sit down and take a bite?"

THE OLD YEAR AND THE NEW IN WALL STREET.

The year just ending has been one of much disappointment in Wall Street. The general business of the country has been active, furnishing large and profitable employment to the great railroad systems; and indeed in the closing weeks of the year the movement of merchandise is so unusual that cars cannot be furnished to handle it promptly. The freight business of the railroads differs from their passenger traffic; sentiment and pleasure have extremely little to do with it, and its activity at remunerative rates is accepted as the best immediate evidence that general trade is in a good condition. Yet the market for railroad stocks has been, speaking generally, a disappointment, and it is only in exceptional cases that prices are higher than they were a year ago; so that Wall Street has again had the distinction of being one of the few discontented places in the country.

The causes of this state of things in the financial centre of the country are constantly under discussion, and while there is common consent as to some of them, others are regarded as serious or unimportant by different groups of men engaged in financial business. Thus it is generally agreed that the retention in the Treasury of large amounts of idle money is a serious cause of depression in financial matters, whether the money so withheld from use is Treasury surplus or only the redemption fund contributed by national banks surrendering circulation. But we do not find the same agreement as to the system which produces the surplus, or as to the law which locks up in the Treasury the lawful money destined to redeem bank-notes which may remain in circulation long after they are "surrendered" by the banks. Nor does it seem to be realized how large these amounts are, and what a difference their retention in the Treasury makes to the lending power of the banks, and therefore to the borrowing facilities of every branch of legitimate business. The Treasury reports an available balance of 25 millions, that being the present excess of its cash assets over its cash liabilities, and among its liabilities are 69 millions of lawful money paid in by national banks to surrender that amount of circulation. Of its assets, the Treasury has 35 millions on deposit with national banks, and this is all that is at the service of the public which has contributed both surplus and redemption fund. Enough weight is not generally given to the cumulative effect of the laws which have brought about this abstraction of lawful money from the daily uses of trade. The effect has probably been more depressing this year, because the moderate amount of railroad building has been chiefly by way of addition to systems already established, and, generally speaking, of a cautious character. The evil effects of unsuitable laws can only be remedied by better legislation, though the Secretary of the Treasury has power to palliate them by purchases of bonds and by judicious deposits in the banks. But business will suffer until the laws are improved.

Of the unfavorable influences which belong to trade itself, Wall Street is inclined to rate first the speculation in "Trust certificates," the Sugar Trust, Lead Trust, Cotton Oil Trust, and Chicago Gas, to be precise, because those that were introduced later aroused no enthusiasm whatever. The four Trusts named had great popularity for a time, and a subsequent collapse which cut their prices in two. Something about them hit the popular fancy exactly, and the stock-market was congratulated on the addition of these stocks to the list of active speculations. But their course was soon run, and now they are dull and depressed, with immense losses counted against them by hundreds of operators. Yet in some form or other these industrial stocks will remain with us, and their number will be increased when present legal difficulties are settled. The Cotton Oil Trust has abandoned the "Trust" form, and reorganized as a regular company, and similar action is expected in time from other trusts. With more responsible management, and with proper official reports to the Stock Exchange and the stockholders, these companies will take their proper position, and after that the remembrances of this year's losses will pass away. Manufacturing concerns on a great scale, their profit is a manufacturer's profit, and people will be able to take an interest in them as understandingly as in railroad stocks. But their performances this year have certainly contributed largely to the disappointments of Wall Street.

For more than half the year the whole railroad market was disturbed by fears about the fate of the Atchison system, with its 7000 miles of road. Bankruptcy and long litigation were finally averted by a wise and bold scheme of reorganization, which met with unprecedented favor from bondholders and stockholders, and this fortunate result has been followed by the increase in earnings that was hoped for. Missouri Pacific was also a standing cause of anxiety, and that trouble seems at last to be removed by an agreement recently effected between that company and the Missouri, Kansas, and Texas. Not until this agreement was reached did the managers of the Missouri Pacific give any information as to the business of their road. They allowed damaging reports to circulate for months without explaining or refuting. Their object once gained, they issued a satisfactory report of the year's business, and announced that they had cleared off the floating debt by the use of securities already in the company's treasury. But Missouri Pacific has certainly contributed much to make 1889 a year of disappointment. One other instance must be cited, and that is the anthracite coal trade, which shows a decided falling off in both tonnage and prices. The coal roads are important at the Stock Exchange, and their stock, though well sustained, have been very commonly regarded as a menace to the stability of the market. Continued mild weather has hurt them, for their product is largely for domestic use. The customary winter weather would soon restore these properties to favor.

With all these depressing influences, however, Wall Street is hopeful of better things, and not unreasonably. With few exceptions the trade of the country is doing well; the railroads have done well, are doing well at present, and appear to have plenty of traffic assured for months to come. These conditions will tell. It may be said that they tell already in the prices of first-class bonds and of certain stocks. But that is a question of investment. These conditions should also tell upon the price of stocks and bonds which have their definite rank yet to take. When will this occur? No one can fix the day, but Wall Street will be bold enough to do so when it can see the coming end of our present monetary stringency. No one apparently expects this before the January disbursements are well distributed. But, at any rate, there is a pretty general belief that 1890 will not be so disappointing as 1889 has been.

Henry J. Macdonald.

New York, Thursday evening, *December 26, 1889.*

THE GRAVE GETS TIRED YAWNING,

Seemingly, for certain wretched invalids who toddle feebly along, though always looking as if they were going to die, but omitting to do it. They dry up, wither, dwindle away finally, but in the meantime, never having robust health, know nothing of the physical enjoyment, the zest of that existence to which they cling with such remarkable tenacity. They are always to be found trying to mend by tinkering at themselves with some trashy remedy, tonic, or "pick me up" to give a fillip to digestion, or "help the liver." If such misguided folks would resort and adhere to Hostetter's Stomach Bitters it would be well with them. This superb invigorant supplies the stamina that the feeble require, by permanently reinforcing digestion and assimilation. It overcomes nervousness, insomnia, malaria, kidney complaints, biliousness, constipation, rheumatism, and neuralgia.—[*Adv.*]

ADVICE TO MOTHERS.

Mrs. Winslow's Soothing Syrup should always be used for children teething. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. 25c. a bottle.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"The Great Pain Reliever," cures
Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Nicholson's Liquid Bread, an absolutely pure extract of malt, is rapidly gaining in favor as a table beverage. It is not only delightful, but nutritious.—[*Adv.*]

CORNELL'S BENZOIN COSMETIC SOAP
For the complexion and skin. 25 cts.—[*Adv.*]

Beecham's Pills. Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[*Adv.*]

Use Angostura Bitters, the world-renowned South American appetizer, of exquisite flavor.—[*Adv.*]

Dr. Lyon's Perfect Tooth Powder. Whitens the teeth and purifies the breath. 25 cents.—[*Adv.*]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits, 25c. a box.—[*Adv.*]

When the blood is impure, thick, and sluggish, or thin and impoverished, there can be no health. With these conditions, all the functions of the body are impaired, and the result is a variety of dangerous complications. The best remedy is Ayer's Sarsaparilla.—[*Adv.*]

OLD MASTER AND OLD MAN—A NEW-YEAR'S TALK OVER OLD YEARS GONE.—DRAWN BY W. L. SHEPPARD.—[SEE PAGE 23.]

STANLEY'S STORY OF EMIN'S RESCUE.

THE STORY OF EMIN'S RESCUE AS TOLD IN STANLEY'S LETTERS. Published by Mr. STANLEY'S Permission. Edited by J. SCOTT KELTIE, Librarian to the Royal Geographical Society. With Map of the Route and Three Portraits. 8vo, Cloth, 50 Cents. (*Just Published.*)

Mr. HENRY M. STANLEY'S letters, as here arranged, and supplemented by letters from the late Major BARTTELOT, Mr. JEPHSON, LUPTON BEY, EMIN PASHA, and the Mahdi's General, give a brief and connected account of what has been, in some respects, the most remarkable expedition that ever entered Africa. Sir WILLIAM MACKINNON, Chairman of the Emin Pasha Relief Committee, kindly placed at the disposal of the publishers material that has not hitherto been given to the public. It will be distinctly understood that this volume will not trench in any way upon Mr. STANLEY'S larger work, which cannot be published for several months.

OTHER WORKS BY HENRY M. STANLEY.

THROUGH THE DARK CONTINENT; or, The Sources of the Nile, Around the Great Lakes of Equatorial Africa, and Down the Livingstone River to the Atlantic Ocean. With 149 Illustrations and Colored Maps. 2 vols., 8vo, Cloth, $10 00. Half Morocco, $15 00.

THE CONGO AND THE FOUNDING OF ITS FREE STATE. A Story of Work and Exploration. With over One Hundred Full-page and Smaller Illustrations; Colored Maps and Marginal Notes. 2 vols., 8vo, Cloth, $10 00. Half Morocco, $15 00.

COOMASSIE AND MAGDALA: The Story of Two British Campaigns in Africa. With Maps and Illustrations. 8vo, Cloth, $3 50.

A QUESTION ANSWERED.

A CORRESPONDENT in Virginia asks in good faith and with entire courtesy:

> "Do the great mass of Republicans desire to see the negroes of the South made the social equals of their white brothers of the South? Do they desire to see the negroes of the South make and execute the laws, who 'from the beginning' have evinced no aptitude for such things and made no advancement in civilization, or is it the unscrupulous politicians of the Republican party who would sacrifice their white brothers of the South in order to maintain place and power?"

These are questions of the highest importance, which are now asked with great feeling, and which we will endeavor briefly and plainly to answer in the friendly spirit which our correspondent kindly attributes to HARPER'S WEEKLY. And, first, there are no Republicans known to us who wish to see the social relations of the Southern States determined by any other considerations than those of mutual inclination, which determine them in the Northern States and elsewhere. There is no difference upon that point. But the political question is of another kind. Under the Constitution all colored persons born or naturalized in the United States and subject to its jurisdiction are citizens of the State in which they reside. But when the right of suffrage is abridged or denied in any State to any of its male inhabitants properly qualified, the basis of representation in Congress and in the electoral college is to be proportionately reduced; and the right to vote is not to be denied or abridged by any State on account of color.

The Republicans allege that the whites in the Southern States say universally and frankly that while colored citizens shall be personally well treated and educated, and encouraged in habits of industry or thrift, they shall not be allowed, even if they are the majority in any community, to control the local government or to fill important offices; that is to say, if citizens of the United States, and legally qualified voters in a State, by a majority vote in any district of that State, elect a representative in Congress or a Presidential elector, he shall not be declared elected nor suffered to take his seat; but that the candidate of the minority shall discharge the duties of the office. This, the Republicans say, is a plain and undenied subversion of the fundamental principle of the government, which is the rule of the legal majority, and a palpable violation of the constitutional intent. They assert that such subversion cannot be fairly held to involve the interest of a State or of a district alone, because it may give the control of Congress and the Presidency to persons who confessedly have not been legally elected. Consequently it is no answer to the complaint to say that the question is solely one for the consideration of the State, like the election of a justice of the peace or the mayor of a city. As the view of Southern white citizens which we have described is adopted and justified, even by such advanced friends of a "new South" and of national good understanding as the late Mr. H. W. GRADY and the leading journals, the Republicans say it must be accepted as the settled purpose of the more intelligent and prosperous Southern citizens, who thus, without professed hostility to the Union or government, do really propose a radical revolution by practically annulling the fundamental principle of the government, thereby securing a false and unconstitutional representation.

To the specific question of our correspondent the Republicans would answer that they have no more desire to see the negroes control public affairs in Southern States than to see the ignorant foreign-born voters control them in the Northern States. They declare that they wish only to see the Constitution respected and the legal majority govern. They do not concede that the assertion that the negroes are an inferior race, wholly incompetent for political responsibility, and sure in practically assuming it to subvert civilized government, is a valid argument for defiance of the Constitution, and for the permanent disregard of fundamental legal rights involving injustice to the rights of other States and of the people at large. The Constitution knows nothing of superior and inferior races, and the assertion that the colored people are not fitted for political equality, Republicans hold to be but another form of the old allegation that they were not fitted for personal liberty. This we understand to be the Republican contention, and in stating it we answer the question of our correspondent. It is a contention worthy of the most serious and dispassionate consideration by him and all who think with him. The Republican view is doubtless proclaimed by demagogues and party hucksters, but it is also held by the great mass of the party. The course which the party majority in Congress apparently proposes to take we do not now consider. Our present purpose is simply to answer our correspondent.

OUR NEXT NORTHERN NEIGHBOR.

WHILE the Pan, or more properly the partially Pan-American Conference is considering our relations with South and Central America, a committee of the Senate is investigating our relations with Canada, which is the only cognate community with the United States upon the continent. The committee has already collected much information, and in this city the hearing opened the question of annexation. The chairman, Senator HOAR, said that it was the unanimous conviction of the committee, and it is undoubtedly that of the country, that overtures to that result must proceed from Canada. Mr. ERASTUS WIMAN warmly urged commercial union as the present simple and feasible policy for good neighborhood and mutual advantage. Political union he thought might come; but at present, while Canada is undoubtedly ready for commercial, she is not ripe for political union.

This view was controverted by Mr. GLEN, who had been for ten years a member of the Dominion Parliament, and who thought that the country would gladly unite politically with the United States. Mr. GLEN opposed commercial union. But it did not appear from his remarks why, with a community ready to unite with us politically, commercial union would not be an excellent preliminary movement, as disposing those to complete union who now hesitate.

By the necessity of the case our relations with Canada must be more intimate than with any other country, and they must be more carefully adjusted in order to avoid trouble. So long as the Canadian political relation with England is loose and independent as at present, there would seem to be less need of haste. But if the scheme of imperial federation should be consummated, the connection with England would be confirmed and strengthened, and the foreign political leaning of the country determined. Canada would then become a commercial rival, as Mr. WIMAN argued, sustained by British interest and power, and our neighborhood would be a source of constant anxiety. With such a neighbor and under existing conditions commercial union would seem to offer a friendly solution of possible trouble. Certainly it would promote friendly regard with a people conterminous with us, of the same general stock, the same language and traditions, and like our fathers emigrants from "the old home."

MR. SPEAKER HUSTED.

IN the New York Legislature Mr. HUSTED has "broken the record" in the number of times that he has been elected Speaker, and this year he enters without contest upon a term which no predecessor has attained. This distinction is due primarily to his great parliamentary knowledge and skill, to his large public information and experience, to his readiness in debate, and his political tact and affability. The secret springs of legislative action are often very obscure. Important measures demanded by public opinion and promised by party conventions advance prosperously to a certain point just short of becoming laws, and from that point there seems to be no power adequate to move them, and the final compliments pass between the grateful House and the blushing Speaker before the important measure is reached, and the Legislature adjourns leaving the measure on the melancholy calendar of lost legislation. This situation is the legislative doldrums which the friends of good laws always fear.

A skilful and intrepid Speaker can do very much to promote or to defeat legislation. He is the most important officer in Congress, and one of the most important in the national or State government. Speaker REED, for instance, might have appointed a committee upon civil service reform which would have reported in accordance with the wishes of Representative HOUCK and Senator FARWELL, instead of a committee which Commissioner ROOSEVELT highly praises as sure to treat the subject in a friendly manner. The Speaker can thus largely mould legislation. Speaker HUSTED in a hundred ways can promote the passage of the ballot reform law. Indeed, it may be said truthfully that he can either cause its passage or its defeat, and its passage would certainly be the chief triumph that his party could achieve at this session. The issue upon this subject is fairly made with the Governor. He will not sign any effective bill, but he would gladly sign, undoubtedly, a bill which would not secure reform. Amendments in the Legislature, therefore, which would fatally weaken the bill would be a palpable connivance with the Governor.

The conditions of an effective law are as plain and familiar as those of a law in other days to exclude slavery from a Territory. No Republican in the country could have been bamboozled about such a law, and nobody in the Legislature need be bamboozled about a ballot reform law. Certainly the people will not be. The conditions which have been proved in actual trial to be effective in Massachusetts and elsewhere are those which would be effective in New York, and those are the conditions which are essential in the law. If the Governor should veto it, let him take the undivided responsibility. There is no need of helping him by emasculating the bill. It is upon the Speaker that public attention will be concentrated, and if the Speaker could signalize his unprecedented occupancy of the chair in a more memorable way to the advantage of the State than by aiding the passage of this law, that way has not been yet mentioned.

THE REPUBLIC AT COURT.

OUR minister in Portugal and the officers of our squadron in the Tagus walked in the procession at the recent coronation of the King of that country, and some exception has been taken, as if the citizens of a republic ought not to countenance any royal or monarchical ceremonies. But this is putting too fine a point upon a very simple matter. We observe that President CARNOT, of the French Republic, sent very warm congratulations to the young King—a proceeding which signified that while France prefers a republic, she respects the right of Portugal to prefer a monarchy. If we send a minister of the first rank to the Czar of Russia, who is a despot, we certainly expect him to behave like a gentleman in recognizing the forms and ceremonies of an imperial court which we recognize, and we do not intend by such well-bred conformity to approve Siberia or an autocracy, as when England and other free countries sent ministers to the United States before the war, they did not mean to approve human slavery.

If the people of Portugal preferred a republic, they would establish a republic. A King of Portugal today is not a tyrant and oppressor, who imposes himself upon a country by force of arms. Like the late FREDERICK the Good of Germany, he may be as earnestly devoted to the welfare of the people as the editor of the reddest republican newspaper. What is true of Portugal is equally true of England. That country prefers a monarchical form of government. That is to say, the English people think a permanent executive and a house of hereditary peers desirable, under the circumstances, as a part of the pageant of their government. But the real government is vested in a committee of the House of Commons, which is elected by the people, and the government changes when it loses a majority of the representatives of the people. If English public sentiment should change, the form of government would be changed. It would be very rash to say that liberty is less jealously protected in England than in America because there is a Queen instead of a President, or that Parliament is not as sensitive and accurate a representative of the opinion of the country as Congress.

Kings generally, except in Africa and Russia, are now political ceremonies, which continue because the people wish them to continue. But if republicans should treat them as wicked conquerors and suppressors of popular liberty, they would be rather ridiculous. In Brazil, so far as can be gathered from the accounts which seem to be most authentic, the people have acquiesced in the revolution rather than desired it; and they have acquiesced because a change was anticipated, although there was no general sense of oppression or wrong which produced insurrection. There was no personal ill-will to Dom PEDRO. But if he had been a President instead of an Emperor, it is not certain that he could have done more than he did for the public welfare. The provisional government which calls itself a republic,

Google

but which has not been formally accepted by the country, suppressed with the army a movement against its authority, just as a King would have done.

MR. GLADSTONE AT EIGHTY-ONE.

Mr. Gladstone completed his eightieth year amid general congratulations. His career is certainly remarkable, and even now a certain youthful ardor is more observable in him than in former years. Many years ago **Louis Blanc** said of him that his mind was so judicial, causing him to see so strongly the reason of the opposing view, that he could never be a great leader. The quality that **Louis Blanc** remarked, the instinct for fair play and justice even in politics, which prompted the sneer among those of a different kind that he was "a prig," is unquestionably characteristic of Mr. **Gladstone**. Lord **Beaconsfield** laughed at him for changing his opinions upon certain points. But Mr. **Gladstone** quietly replied that he should be sorry to have made no progress in forty years. No public man of his generation, indeed, illustrates more fully Mr. **Emerson**'s description of himself—an endless experimenter with no past at his back. If he cared to speculate upon the verdict of history on his course, he might recall Sir **Robert Peel**, who broke with his party, but not with "good fame."

Among the tributes to Mr. **Gladstone** upon his birthday is an autograph album from America, in which we observe that Mr. **Depew** states that he occupies a place in American esteem never occupied by any foreigner except **Lafayette**. We are inclined to think that the hold of **John Bright** upon the American heart of his time was stronger. There is a certain alloy of politics in the profession of feeling for Mr. **Gladstone** which did not taint that for Mr. **Bright**. During the crucial contest in this country **John Bright** withstood powerful opinion in his own country, including that of Mr. **Gladstone**, and with eloquence and force unequalled since **Burke** asserted and defended the essential American principle of liberty and union. Neither **Burke** nor **Chatham** in the Revolution was a friend to America more true and sympathetic than **Bright** in later days, and it is not pleasant to remember that some of those who now most vociferously praise **Gladstone** refused a word of respectful regret for **John Bright**.

It seems almost too much to expect that time will permit Mr. **Gladstone**'s return to official power. But even the fatal hand of time cannot steal his true glory, the example of great powers consecrated to the highest patriotism, and unabated intellectual vigor and freshness of feeling at threescore and twenty-one. Every man of the English race may well be proud of so sturdy and commanding an illustration of the higher and characteristic qualities of the English stock.

AN OBSTRUCTIVE DUTY.

The Committee on Ways and Means in Washington gave a hearing during the holidays to a committee of the National Free Art League. The committee is composed of well-known artists, who asked that the thirty per cent. duty now levied upon works of art be removed, because it is a protection which does not protect, and against which those who are supposed to be protected protest. To an inquiry sent to every artist, art institution, and art teacher in the country whose address could be procured, 1435 answers were received, of which 1345 desired the total abolition of the duty, and only seven favored the retention of the present rate.

The duty places American artists in the humiliating position of needing protection against other artists in a competition of talent and skill, while at the same time it limits their opportunities of study by obstructing the entry of foreign pictures. There is not a more indefensible tax in the tariff. Except upon the theory that protection is a sacred principle, and that everything brought into the country ought to be taxed, there is no excuse for retaining a duty which, by the practically unanimous declaration of the protected class, is an injury to it.

THE WEATHER AND THE INFLUENZA.

The weather and the influenza were the main topics of holiday conversation. The green Christmas was never more charmingly illustrated, so far as the soft and brilliant day was concerned, and the persistence of mild weather until New-Year's Day was regarded as evidence of the assertion which was attributed to various scientific authorities, and probably was uttered by none—that the Gulf Stream is drawing nearer to the coast. Such a movement would carry "the world" to Newport in the winter, for the gentle salubrity of the sea-air on Rhode Island has been long ascribed to the closer neighborhood of the Gulf Stream than at any other point upon the coast.

The other topic, the grippe, may be said to speak for itself. Nothing is more striking and mysterious than the sudden diffusion of such a malady over the globe, and the dazed speculations of professional wisdom in regard to its nature and conditions. In England Mr. **Smalley** writes that the prevailing trouble was thought to be only a pronounced epidemic of the ordinary "cold," and not the disorder which was prostrating St. Petersburg and Paris. It is called by the name made familiar in Paris some years ago, and is apparently an affection of the same kind, while here its victims insist that it is very different from a cold or a common influenza.

It would be a curious study to determine how much the general health is affected by the universal publicity and startling details given in the press to the symptoms and spread of the illness. If the general symptoms of cold in the head, headache, and high temperature and sneezing, indicate the presence of the Russian invader, as there is always an abundance of such symptoms at this season, the extent of the new malady would naturally seem to be very great. Happily thus far there has been nothing very alarming, however disagreeable and annoying the visitor may be. But if there be a connection between the green Christmas and the influenza, the dandelions and even roses with which Christmas was crowned in this neighborhood will be gladly relinquished to Jack Frost on condition that he excludes the Russian tyrant of the hour.

ELECTRICAL EXECUTION.

The General Term of the Supreme Court of New York in its fifth department affirms the constitutionality of the electrical execution law, and the question will now be carried to the Court of Appeals. The opinion of the General Term, written by Judge **Dwight**, is conclusive, and the final decision cannot be called doubtful. The plea of cruel and unusual punishment disappears before the fact that while hanging is undeniably cruel, execution by electricity is instantaneous, painless, and less revolting to the spectator than the present system. If it be unusual, it is only so in the sense of all improved methods; and if the word unusual should be interpreted as in the argument against the new method, no improvement could be adopted. It is now, however, well understood that the effort to set aside the law as unconstitutional upon the grounds alleged is a movement of an electrical light company, and does not spring from concern for the Constitution or for human suffering. It is well, however, that both the constitutionality of the law and its humanity should be amply vindicated before the change is consummated.

PATRONAGE AND DIRT.

The Mayor's recommendation that Mr. **Coleman**, the chief of the Street-cleaning Department in the city of New York, should be removed, and Mr. **Coleman**'s resignation, are the latest incidents in the desperate endeavor of the city to secure clean streets. Thus far the problem is altogether too much for official competency. But under private contract and supervision streets are kept clean. The explanation of this fact is largely evident in Mr. **Coleman**'s letter, which shows the usual trouble in all public official efficiency—the wretched squabbling over patronage. It is ludicrous to see party politics and political factional quarrels appearing in the business of street cleaning. Yet it is useful as showing the costly absurdity of the proceeding. It is not the Commissioner of Street Cleaning, it is the system under which he is compelled to work, which makes the streets of New York dirtier than those of any other great city in the world, and comparable only to those of Constantinople.

CHANCELLOR PIERSON.

The late Chancellor of the University of New York was a familiar public figure, and his sudden death surprised and grieved a large circle of friends, whom his hearty geniality and courtesy held in the pleasantest personal relations. He had the honest and sturdy respect for letters which is felt by a man who has bravely made his own way; and although his life was mainly that of active business, his taste for intellectual pursuits and his respect for scholars remained always unchanged. He had a deep sense of the dignity of the official headship of the system of higher education in New York which he held for some time before his death, and he discharged its duties with unremitting zeal and uprightness. The affable hospitality of his home maintained the traditions of his office, which is one of the oldest in the State, and it was during his incumbency that the law was passed defining more clearly the duties of the University, and opening to it the opportunity of increased efficiency in its various functions. In all such progressive movements the Chancellor was actively interested. Mr. **Pierson** carried into all public relations and duties the generous ardor of his nature, and he falls in the fulness of his powers, and to the last moment devoted with unabated energy to his duties. His portrait will be found upon another page.

BROWNING IN WESTMINSTER ABBEY.

Robert Browning lies in Westminster Abbey, beside **Chaucer**, to whom in blitheness of spirit **Landor** compared him, and in Venice the municipality have ordered a memorial plate to be placed on the Palazzo Rezzonico, where he died. In Florence there is already a tablet upon Casa Guidi, where he and his wife lived, and the name of Casa Guidi she gave to English literature. These tributes from Italy are very fitting, because no poet has more sympathetically and profoundly interpreted medieval and modern Italy than **Browning**. It was, indeed, his second country, although even there his strong and virile English heart, with deep English longing, sang:

> "Oh, to be in England, now that April's there!"

Italy has always fascinated English poets. **Milton**, **Byron**, **Shelley**, **Browning**, are all names which the pilgrim to Italy will at once recall. The romantic feeling of the last English generation for Italy was so adequately and admirably expressed by **Byron**, that almost every famous name and object in the country recalls a Byronic line. **Browning**'s appreciation and interpretation are more subtle and dramatic, and those who remember the days of the Italian contest with Austrian dominion can comprehend the power and tragic pathos of such poems as the "Italian in England."

The tributes paid to the poet by Italy are very significant and touching. Holland always honored **Motley** for telling her splendid story so worthily, nor suffered the fact that he was a foreigner to abate the grateful ardor of her admiration. So with Italy and **Browning**. The country with "the fatal gift of beauty for a dower" cherished no bumptious jealousy that the truest modern interpreter of her life was not an Italian. The fact has a large moral. No Italian would show himself to be a better patriot if he should insist that Italy had poets good enough for her, and that she had better reserve her honors for her own children. Generosity is as precious an element of love of country as of love of kindred and friends:

> "True love in this differs from gold and clay,
> That to divide is not to take away."

STANLEY'S LETTERS.

A **very** interesting little volume is just issued by the **Harpers**, containing the letters written by **Henry M. Stanley** to the committee organized for the relief of **Emin** Pasha and to various friends, together with letters between different parts of the expedition. The work is in fact a kind of brief and rapid summary of the route and fortunes of **Stanley**'s great march, but it is of course entirely independent of the work of description and detail which he will prepare for publication.

The simple statement of the dangers, disasters, and death which this brave expedition encountered is very impressive. The most acute and trying difficulties are mentioned quietly and without rhetoric, although occasionally the writer gives glimpses of the singular beauty of the region that he traverses. A very interesting fact is the glamour and enchantment of equatorial Soudan both upon **Emin** and his people. They did not know whether they wished to come away or to remain. The old tradition of the indolent charm of the lotus is recalled by this curious languor and hesitation in the lands around the very sources of the Nile, upon whose banks the lotus grew. The book has all the fascination of a story of wild adventure, which is even more charming from the entire want of literary exaggeration.

PERSONAL.

Robert T. Lincoln, United States Minister to England, has spent little of his time during the past two months in London, the serious illness of his son **Abraham** at Versailles, France, calling him there. An operation on a carbuncle came near ending fatally for the boy, and the slowness of his recovery is very discouraging.

—Among the new Congressmen is **Posey Green Lester**, of Virginia, a Baptist minister, who has preached in a dozen or more different States, and has also edited a hymn-book.

—Mr. **Robert Thorne**, M.A., who for some years was in charge of the scientific department of St. Paul's Cathedral School, has prepared a volume of *Fugitive Facts* which contains much interesting data, usually left out of the cyclopædias. The progress in the uses of electricity, which has been noted from time to time by the **Weekly**, is here presented in a concise form, and the book is one of value to those who seek for information out of the ordinary run.

—A more remarkable man than the late **MacMurrough Kavanagh**, of Carlow, Ireland, was in many respects never sat in the British House of Commons. Although nature had deprived him of arms and legs, he was a strong and entertaining orator, and never spoke to empty benches. An exception to the rule that members must address the House standing was made in his favor, and other courtesies were extended to the man whose intelligence, noble face, and conscientious attention to his duties made him a popular and valued member. Mr. **Kavanagh** came of an old and wealthy family, and had a beautiful wife and a large number of children, none of whom were in any way deformed. His physical defects were so well supplemented that he rode fearlessly, drove a four-in-hand coach, wrote beautifully, and acquired considerable fame as an amateur artist.

—Among the curiosities of humanity may safely be included the wealthy Mrs. Dr. **Henry Hiller**, of Wilmington, Massachusetts. About a year ago her husband died and was buried in a $20,000 casket, which rests in a $5000 temporary tomb at Wilmington. Now Mrs. **Hiller** is building a $100,000 mausoleum at Winchester, Massachusetts, where she hopes ultimately to be buried with her husband in elaborately carved sarcophagi which will cost $50,000 apiece. Her own casket will cost a similar amount, and the value placed on her burial robe, which is of rare silk and lace, with silver hooks and eyes, is $22,000. In the elaborate carvings on the tomb and sarcophagi are represented characters from the Bible, Shakespeare, Bunyan's *Pilgrim's Progress*, etc., while many inscriptions are used. By the expenditure of about half a million, Mrs. **Hiller** hopes to overcome the usual repulsiveness of burial. Mrs. **Hiller** has been a great traveller, and is a woman of wide and varied culture. She has had twenty-three children, fourteen of them twins, but none of them survive.

—Some of the leading politicians and society men in Boston, among them ex-Mayor **William E. Russell**, of Cambridge, [illegible] **Butler**, **William F. Weld**, **A. W. Longfellow**, and **Francis Peabody**, belong to a club known as the India Wharf Rats. The members are expected to know how to cook, and they have given a number of successful dinners which are supposed to have been prepared entirely by themselves.

—One morning in last September, Mr. **Spurgeon**, the London preacher, warned his congregation that his health was giving way, and said he felt that he might not be with them long. He was suffering severe pain then from gout in the knee, and is now threatened with a serious throat ailment.

—The late ex-Empress of Brazil had been married to Dom Pedro for forty-six years, and her death is a heavy blow to her husband, the strong affection of the aged couple for each other being most touching. The Empress had been in a delicate state of health for many years, and had suffered much from deafness. She was a princess of the royal house of Naples.

—It was long ago said of Mr. **George W. Childs**, the publisher of the *Public Ledger*, that he was the two "Cheeryble Brothers" rolled into one; but probably a more appropriate name for him would be the Santa Claus of the newspaper world. On this last Christmas Day Mr. **Childs**, it is said, gave presents amounting to many thousands of dollars in hard cash to the editors, reporters, compositors, pressmen, and other employés of the *Ledger*. When it is considered that the salaries and wages paid by Mr. **Childs** are as large as the largest paid by other Philadelphia publishers, it will be recognized that any one associated with him in his work has cause to be satisfied with his employer. It is said by his employés however, that they have even greater cause for satisfaction with him because of his daily consideration for them than for his Christmas bounty. It is represented to be pretty much of the same admirable sort as that of Mr. **Fezziwig** for his employés, which was so warmly described by Scrooge. "He has the power," said old Jacob Marley's partner, "to render us happy or unhappy; to make our service light or burdensome; a pleasure or a toil. Say that his power lies in words and looks, in things so slight and insignificant that it is impossible to add and count 'em up; what then? The happiness he gives is quite as great as if it cost a fortune." That is said to describe with wondrous accuracy Mr. **Childs**'s relations with his employés, who say he is a man who honors Christmas in his heart, and keeps it always.

THEIR EXPERIENCE IN A FLAT.

BY CHRISTINE TERHUNE HERRICK.

I.

They had looked at houses large and houses small. They had ascended into garrets, they had descended into the uttermost parts of cellars. They had inspected basement stairs, waste-pipes, sewer traps, sinks, ranges, coal-holes, furnaces, butlers' pantries, kitchen dressers, china and clothes closets, and all the other uninteresting corners that are supposed to demand an attentive and jealous care, whose presence characterizes a good manager, and whose absence indicates "no sort of a house-keeper." And with every fresh domicile thus examined their backs and legs grew wearier, and their spirits more depressed. The prospect was not cheering to a woman who had until now never kept house except in a country town, where everything was above-ground.

"We did not have to cook in a cellar and take our meals in a foot-tub, dubbed by courtesy a basement dining-room, when we lived *there*," said Mrs. Goodenough, mournfully, to her husband, as they descended the front steps of the sixth two-story and basement brown-stone or brick mansion they had visited that morning.

And just then the idea struck her, and she stood still in the middle of the pavement, and cried, "Oh, Jim, let's take a flat!"

Why this plan had not suggested itself to one of them before, neither could say, but certain it was that although they had discussed their prospective home in the city from every other point of view, they had never, until this moment, thought of living in any way but that which had been theirs in their country-town home—namely, in a house by themselves. But they found none like the nest that had been their first abiding-place, and Mrs. Goodenough was secretly sure she could never be happy in one of the up-and-down little boxes over which she had been dragging her aching limbs for three days. Nothing but steep stairs and long narrow parlors that looked like steam-boat saloons; and then there was always one stuffy middle room upstairs, where no light entered except through the front or back chamber. She mentally included them all in one sweeping condemnation. But a flat! *That*, at least, would have no living rooms underground!

Jim looked rather grave at the suggestion. He was not only country-bred but country-born, and did not have the innate love for the bustle and roar of the streets, the longing to be in the midst of the active and throbbing forms of life, that were in his wife a relic of a girlhood passed in the greatest of American cities. He rather shrank from becoming too deeply involved in town customs just at the start, and clung to the simpler modes made dear to him by long association.

"I don't know," he said, slowly, after a little space of serious thought. Jim always liked to think about things before he did them, while his wife usually did them first and thought about them afterward. "I have always heard that flats did away with all privacy," he continued; "that the rooms open into one another, and that they are not very pleasant for people with young children. I did hope," half hesitating, "that we might have our own front door and door-bell, and a little piece of ground where the babies—"

"Ground in the *city*, Jim? You must be dreaming that we are made of money. What ground have we seen attached to any of those—those *chicken-coops* we have been studying ever since Tuesday? And as for door-bells, you have those in a flat, I'm sure—electric ones, too!"

"Just as you please, dear. You will be in the house more than I, and you are the person most to be consulted. But," making a last faltering stand, "I always thought you abhorred the idea of living in the same house with two or three other families."

"James!" Mrs. Goodenough almost screamed. "Do you suppose we mean to go into a tenement? An apartment-house is more than respectable; it's—it's *swell*. Lots of the richest people live in them. It's not anything like taking the second or third floor of a house with three door-bells, one above the other, on the front door-post!"

Thus decided, back they went to the real-estate office. The agent, who must have been heartily weary of their repeated appearances, although he gallantly strove to conceal the fact, brightened visibly when they made known their decision.

"Flats? why, plenty of them! Just look at this list," pointing to a framed schedule hanging on the wall. Upon its surface it bore a goodly record of flats to let, their locality, size, number of rooms, and rate of rent.

With that propensity to frugality, as marked in many women of to-day as it was in Mrs. Gilpin half-way down the last century, Mrs. Goodenough glanced at the figures at the ends of the printed lines. They were a good deal higher than she had expected to find them. But her attention was drawn from them to the agent, who was glibly rehearsing the manifold advantages of flats.

"They are far better than houses, for small families," he affirmed. "All on one floor, no running up and down stairs whenever you want to give an order or see what the cook is about. No cellar to look after, no halls to clean, no stairs to brush, no snow to clear off, no sidewalks to sweep. The janitor takes care of all that. Housekeeping is a mere trifle, and the care of your home a pastime."

Mrs. Goodenough listened eagerly, although inwardly rather incredulous as to the possibility that the care of a house could ever be the simple business thus described. She had kept house for three years, much of the time with indifferent servants, and had, perhaps, become a trifle pessimistic. Still the general outlook seemed so attractive, as glowingly depicted by the agent, that she caught herself wondering why, if all this were true, the entire population had not already quitted their separate domiciles, and made one wild rush for flats.

Furnished with a list of eligible apartment-houses, the two young people started out on a fresh round, curiosity and interest overcoming fatigue. They had not far to go to the first flat—an imposing building on the corner of a business street. A be-buttoned boy threw open the door for the seeking pair, and bowed them to the elevator. Up, up, up—five, six, seven stories.

"Oh, Jim, I should never dare live here," faltered Mrs. Goodenough. "*What* would we do in case of fire?"

The bell-boy caught her whisper.

"The house is fire-proof, madam," he said, condescendingly, "and is provided with fire-escapes besides."

"I don't care!" she retorted, illogically. "I should never feel comfortable here if there were six fire-escapes at each window."

The bell-boy smiled superciliously, but deigned to display the handsomely furnished rooms, and pointed out the beauty of the view from this elevation. None the less, the little woman held firm to her refusal to take the apartment—a determination strengthened by learning on consultation of the agent's list that the rent was high in proportion to the altitude of the building.

"Jenny, where do people who live in flats dry their clothes?" queried Jim, as they again stood on the sidewalk, the question evidently suggested by a passing Celestial with a laundry parcel under his arm.

"I'm sure I don't know," said Jenny, thoughtfully; "there must be some yard or other place where it can be done. It can't be possible that all the people who live in flats send all their things to laundries. If that were the case it would measurably mitigate the horrors of Chinese cheap labor, I should think."

The next flat inspected was on the second floor. The main entrance was gruesome; the black and white marble of the floor, the gray of the walls, broken only by a little black stencilling here and there, gave the house the appearance of having gone into half-mourning, and was decidedly depressing. They climbed the dimly lighted stairs—there was no elevator here—and were ushered by the colored janitor into a fair-sized, very bare-looking room with two windows. Their cicerone waved his hand complacently:

"This is de parlor, sah! De hall room openin' from is may be used as a liberry. De apartment back of it may be used as a sittin'-room," indicating an eight by fourteen apartment, insufficiently lighted from the parlor. "There is no dark rooms in de flat."

"But what do you call that?" asked Mrs. Goodenough, pausing on the threshold of the chamber back of the sitting-room. "I consider this decidedly dark."

"Oh no, madam," patronizingly indulgent of her misapprehension. "This window," raising the small sash with an air as of opening a wide passage for sun and breeze, "gives d'reckly on de open air. There are a passage three foot wide between this house an' de nex'."

Sure enough, by craning one's neck a glimpse of the sky could be obtained through the narrow fissure that separated the house in which they stood from the towering brick wall of the next building. The two other diminutive bedrooms were "lighted" and ventilated in similar fashion. This decidedly would not do.

It is hardly worth while to describe at further length the trials to which the two young country-people were subjected in finding a flat to suit them. One had a dirty entrance, another had a distinct smell of sewer gas that told a tale of defective drainage, a third had no private hall, and a fourth lacked one room of the necessary number; and in every one there was a smell of cookery, a haunting of the halls by the ghosts of dead, but not altogether gone, dinners; or if gone, "not forgotten," as Jim said.

They went back to their boarding-house at night wearied and worried almost beyond endurance. They started out again early the next morning on their depressing round, but it was after mid-day before they found a flat that seemed in any degree to fill the measure of their expectations. It was up two long flights of stairs, but after the worse climbing they had done they did not complain of this. Then a great advantage—the house was nearly new. The stairs were easy, and the main entrance pleasant. The rooms were really *all* light. There was a square apartment, for a sitting-room or library, with two windows; two more brightened the parlor. The two bed-chambers had each a large window opening on the free air; there was a very pleasant dining-room, a small kitchen, and back of that a tiny chamber for a servant. The long private hall widened just outside of the dining-room door, affording a place for a refrigerator; and the window in the wee bath-room and that in the hall were the only ones that opened upon a court. And a tremendous advantage, emphasized by the landlord—the whole house was heated by steam. There would be no stoves to buy, no furnace to look after.

This final consideration helped to reconcile the young people to the fact that the rent was just twelve dollars a month more than they had meant to pay when they made their plans for house-hunting. But they consoled themselves with the thought that if they had had to buy stoves and coal, and hire a man to take charge of the fires, they would be at a much heavier expense, especially when they reflected that the services of the janitor included the care of stairs, steps, sidewalk, and main hall.

And so they took it. There were two or three disadvantages that in the first flush of excitement they overlooked or failed to appreciate, that came back to Mrs. Goodenough after the lease was signed, and gave her sundry twinges of discomfort. In the first place, there were almost no closets. Two large presses and one tall narrow cupboard were all the space allotted for the hanging of clothing. There were a china closet and a kitchen pantry besides, that was all. Then the only register in the house was in the front sitting-room, and how the whole suite of rooms was to be heated from that was a serious question. And there was no trunk-room, and the kitchen was very small. Still, the young house-keeper shut her eyes to all deficiencies, saying sternly to herself, "It is too late to worry now, the whole thing is settled," and resolutely brought forward all of the Mark Tapley in her nature, determined to make the best of things.

Woman-like, she could not be happy until she had definitely settled in her own mind just how each room of her new abode should be arranged. The family was not very large, but judgment had to be displayed in disposing of its members. The front sitting-room, the little woman decided, must be used as a nursery for the children and a sleeping room for the baby and her nurse. This apartment must also serve as Mrs. Goodenough's dressing room, for the chamber back of the parlor, that she had selected for herself and her husband, was too small to admit other furniture than the bed, the baby's crib, Mr. Goodenough's bureau, and a chair or two. The bedroom behind that was to be reserved for a guest-chamber, while the cook would of course occupy the little cubicle back of the kitchen.

So far so good, and Jenny immediately fell to making tremendous mental calculations as to how she could cut over carpets, refit mattings, and place furniture so that there would have to be comparatively few additions made to the stock of domestic goods and chattels the young householders already possessed.

It was golden October weather, and the two worked early and late getting the flat to rights. The landlord was persuaded to stain some of the floors for a width of two or three feet around the sides of the rooms, so that rugs could be laid down and the cutting of carpets avoided. A woman was hired to sweep and clean, and Mrs. Goodenough tried hard to show Christian philosophy when she found that her handmaiden *pro tem.* had scrubbed off most of the coating of stain while it was yet moist. To be sure, they were obliged to have the staining done over again at their own expense; but then accidents will happen in the best-regulated flats, and they had too much else to think about to waste time in grumbling over this *contretemps*.

They tacked down mattings, put up curtain poles and shade fixtures, hung portières, arranged draperies, and worked like beavers all day, stopping only long enough at noon to lunch frugally off of sandwiches or sardines and crackers, or some equally light refreshment. Their fingers were bruised and blistered, their muscles and joints strained and sore, but they persevered, cheered by the thought that the end would crown the means. In the main, affairs ran smoothly. The first serious hitch came when they found that by the exercise of no powers of compression within their capabilities could they force their kitchen utensils into the small pantry intended for their accommodation. Mrs. Goodenough had always prided herself upon the number and variety of labor-saving implements she possessed, but she now, for the first time, found this wealth a burden. The diminutive pot closet could not furnish space for more than half of her saucepans, soup-pots, double boilers, frying-pans, broilers, and Scotch kettles. She put up a long shelf over the set tubs. She drove uncounted nails and inserted screw-hooks *ad libitum*, but all in vain. The barrels and boxes continued to disgorge bowls, butter-paddles, pots, potato-beetles, sieves, strainers, kettles, colanders, egg-beaters, salad-baskets, iron spoons, wooden spoons, split spoons, toasters, funnels, dripping-pans, bread-pans, gem-pans, biscuit tins, cake tins, cake-cutters, cake-turners, muffin-rings, jelly-moulds, pudding moulds, waffle irons, pint measures, quart measures, tin cups, dippers, steamers, dredging-boxes, sugar-buckets, spice-boxes, rolling-pins, skewers, larding-needles, dish-pans, and bread-boards. The griddle, the meat-chopper, and the clothes-boiler completed the motley assemblage, and were the last touch required to reduce their owner to despair. A desperate remedy must be applied, and the only one that presented itself to her mind was to resign the guest-chamber, put the cook in there, and convert the apartment hitherto designed for her use into a store-room. So, leaving the pile of house-furnishing goods in the middle of the floor, they proceeded to make the necessary changes. Luckily, the furniture for the guest-chamber was still unpurchased, and it did not take long to pull up the matting from the floor of the store-room that was to be, and to transfer the cot, bureau, wash-stand, and chair to the larger apartment. An old set of book-shelves held some of the too numerous utensils; a long shelf, hastily put up by the carpenter, served as a resting-place for others, and everything that could be hung was suspended from nails and hooks. The clothes-basket, clothes-horse, and ironing-board also went here; and space was made for a deal table which Jenny designed should serve as a place for the making of cake, pastry, etc.

No other salient difficulty presented itself, although many were the minor tribulations encountered. The china closet was so small that they were forced to buy a dresser to hold their glass and porcelain. The clothes-press in their bedroom obstinately refused to contain all of their not extensive wardrobes, and Jenny was obliged to put up hooks for her dresses wherever she could—an expedient that proved decidedly embarrassing one day when a hasty sweeping aside of a portière revealed to a caller a tea gown hanging close against the folding doors, on the side next to the parlor. Jim was obliged to find a place of storage for numerous small tables and extra chairs, a bureau, a wash-stand, and a sofa, and sold a spare bed at a sacrifice that they might buy in its place a folding-bed to be put in the nursery. There was no space in there for a crib, so a hammock was used for the baby, who roomed with the nurse. This, owing to the small size of the chamber, had to be swung from the window-casing at one side of the room to the door-post on the other, thus placing an obstacle in the way that must be crawled under by any one desiring to cross the room while the baby was asleep.

Still, in spite of all this they had a merry time getting to rights. Jenny had a true woman's passion for snipping and stitching and contriving, and she threw herself with enthusiasm into the business of rejuvenating old belongings. The carpet that had covered the hall floor in their former home was ripped, beaten, and made over into a square rug for the dining-room. Stair carpeting was laid down the long hall, a strip of stained floor being left visible on each side. The old mattings were turned, and sponged off with salt and water, that they might do duty in the bedrooms; while the supply of small rugs, that had seemed insufficient when scattered over a whole house, became generous in number and proportion when arranged in a flat. For the apartment which was to be combined library, study, and parlor Mr. and Mrs. Goodenough went to the extravagance of purchasing a large imported Oriental rug, stifling the consciences that rebuked the rather reckless expenditure with the eagerly offered assurance to one another that the best is always the cheapest. To do the rug justice, it verified the aphorism by wearing capitally; but as much could not be said for the curtains. These also possessed the merit of costliness, and looked extremely pretty for the first few weeks after they went up. But, alas, it was not long before dust and light did their work, and reduced the delicate robin's-egg hue of the dainty hangings to a dirty neutral shade.

The new tenants had been allowed to use their own taste in the tinting of the walls, and they selected a soft terra-cotta, that supplied an admirable background for pictures. Of these they had a goodly store; and when the engravings and etchings were hung, their cabinets for bric-à-brac in place, the sconces, plaques, and bits of drapery all arranged, the parlor took on at once a cozy, *lived-in* look that was very charming.

This apartment was its owners' delight, for here they felt they were duly rewarded for their labors. The bedchambers were small, and did not lend themselves readily to decoration; and the sitting-room, which Mrs. Goodenough had promised herself should be a model of home comfort, was doomed to be a disappointment. Events speedily proved that this apartment was to be the *omnium gatherum* of the family belongings. There is always one such in every home, a sort of domestic maelstrom, into which are drawn the ornaments and furniture that are the drift-wood of the household. And as in this flat there were few closets and no lumber-room, the nursery seemed to be the only place in which to hang clothes-bags, laundry-bags, and shoe-bags, or in which to keep the children's toys, books, etc. A set of book-shelves that would go nowhere else was placed directly across the closed fireplace, and concealed by curtains that hung from the broad mantel shelf above. It was the struggle of poor Jenny's life to keep that room in a condition even approximating tidiness, but her efforts generally proved futile, because there was no place to put the articles she picked up. They could at best only be stacked in a corner in an unpicturesque pile.

The dining-room was very pleasant, with its two windows, through which shone the morning sunlight. Scrim curtains, that could not be injured by any amount of glare, hung at the windows; a stationary sideboard let into one side of the room held the ice pitcher and some large pieces of china. In the recess left on one side of that buffet was the china closet proper, which, after the purchase of the dresser, was appropriated for preserves, jellies, and pickles. At the other side of the stationary buffet was an arched doorway leading into the servant's room. The door into this was kept locked, and the embrasure converted into an apology for a closet by aid of a curtain hung before it. In this nook stood a couple of chairs for which there was not space outside, and it also served as a convenient receptacle into which to hurriedly thrust the odds and ends the babies had left lying about. These were always perceived at the last minute, of course, when dinner had been announced and there was no time for any more orderly disposition of the litter. In this, as in the other rooms, pictures and brackets were hung. The sideboard held a pretty array of choice china and glass; dainty cups swung above their saucers from small hooks screwed into the back of the over-mantel; and there was the same home-like look here that pervaded the drawing-room. The whole flat was as clean as wax, and in complete order, on the bright day when they finally moved in, babies, baggage, and all.

II.

It was the last of October when the Goodenoughs found themselves snugly settled in their new home. The weather up to this time had been exceptionally warm and pleasant, and they had been obliged to take on faith their landlord's assertion that the steam-heating apparatus in the basement would make the whole house so comfortable that there would be no need of additional fires. For the sake of the look of home cheer it imparted, they had put up an old-fashioned brass-mounted Franklin in the parlor, and they really revelled in anticipation of the pretty ingle-side picture they would have when the blazing fire of logs would be reflected from the polished surfaces of the antique brass andirons, fender, and fire-irons. Still, they wished to reserve this pleasure as a luxury, not to practise it as a necessity.

In spite of the numerous arguments Mrs. Goodenough had heard in favor of the superior economy of flats over whole houses, she and her husband had found that the difference of expense in furnishing was not marked. To be sure, they had not had to buy a stair carpet, and the shades in the front windows had been put up by the landlord. But there were plenty of other windows, and these the shades that had been used in their country home obstinately refused to fit. Then, the new parlor rug and draperies, the hall carpet, the carpenter's work, and a dozen minor items had altogether gone well beyond the sum the two had set aside for "moving expenses," and had even ingulfed the "margin" which long and painful experience had taught them always to allow in any estimates of which they could not be absolutely positive. So Jenny was quite prepared to conduct her house-keeping on as moderate a scale as possible, retrenching all unnecessary luxuries until the deficit that looked at them with such an ugly face had been entirely made up.

What she was not prepared for was to find that within the month they would have to buy a stove and renew the supply of fuel they had flattered themselves would last all winter. One of the sudden changes of weather for which the Eastern climate is almost proverbial had sent the mercury well toward the bottom of the tube, brought ice on the puddles, and set house-keepers to hunting out the thickest wraps and heaviest bedclothing. Mr. and Mrs. Goodenough excused the slight stream of heat that came through their one register by the plea that a furnace never does its best the first time it is burned, and promptly lighted their wood fire, not sorry, perhaps, for the excuse. It smoked; cold chimneys always do, said they, and stood it as best they might, with tearful eyes and reddened faces, long enough for any self-respecting chimney to have become heated seven times. They thrust blazing newspapers up the flue, they piled on kindling with lavish hands, they worked the bellows until their arms and backs ached, and finally, when patience had ceased to be a virtue, they sent for a stove-man.

He made a careful examination of the fireplace, and pronounced that the only thing to benefit it was a "hood" of cast-iron, fitted across the too-open face of the Franklin. This was put in (at a cost of $2.25 for materials and labor), and with renewed hopes they "lighted up" again, only to find that matters were made worse, if that were possible, by the disfiguring addition. Time and memory failed them in the endeavor to keep count of how many times that stove-man was sent for to "look at" the fireplace and prescribe for it. But the bill had swelled to formidable proportions before the oracle finally announced that "there wasn't nothing as *could* be done with that air stove, for the draught wasn't no good in that chimney, anyhow."

Meanwhile the cold weather lasted, the furnace fire still continued depressed, and the family alternated their fits of shivering with entreaties to the landlord to do something and maledictions upon his head because he would do nothing. The stove-man inspected the furnace, and pronounced that it was doing its best, but that it was too small for the house. The only days upon which it seemed fairly adequate to its task were the mild ones, and then it sent forth a volume of heat that almost roasted them out. The cold weather invariably seemed to discourage it to such an extent that all it could do was to be low and sulk.

At last matters came to a climax. Jenny had opposed the purchase of a coal stove, pleading its ugliness, its expense, and the extra care it would involve. But when the baby was threatened with croup, Jim walked himself off with no word to any one, and sent home a gas stove.

"It costs less than doctors' and druggists' bills," he said, decidedly. And what a comfort it was! how much room it took up! and what a blot it was upon the pretty parlor! They couldn't have lived without it; but it was very hard to live with it. Meanwhile they had fared no better in the dining-room, so far as heat was concerned. That, they had been told, would be amply warmed by the range fire—an assertion that was verified when summer came. But during the winter, in spite of their enduring all the smells of the cooking in order to get the benefit of the heat from the kitchen, they found this totally inadequate except upon the blandest days. One gas stove was all the family finances could stand, so Mr. Goodenough bought a little air-tight wood stove, and they knew comfort until the bill came in. The extra price they had paid for rent in the firm persuasion that there would be no fuel bills except for the coal burned in the range, and the little amount of wood the Franklin would consume, was dissipated, with many other of their illusions concerning flats.

Before they had been in their new quarters a week they had learned that they would have to submit to a constant trial, which, although it might be termed vicarious in that it was occasioned by the sins of others, yet had no atoning results in any direction. This discomfort was caused by the odors of other people's meals, which, willy-nilly, they were obliged to inhale; to reverse the apostolic saying, "who burnt and they were offended not?" When they came home to dinner, by the time they reached their apartment on the third floor they had passed through the successive vaporous strata of corned-beef and cabbage from the basement, boiled codfish from the first étage, and onions from the second. Mrs. Goodenough's memory tablets were indelibly engraved with the recollection of the mortification that filled her soul one day when she opened her drawing-room door to usher out a couple of very distinguished callers, and had her nostrils and theirs filled by the rush of "a perfect simoom" of fried onions which had made its way up the elevator shaft.

There was, of course, no mode of alleviating the infliction. In this land of the free one can hardly dictate the bills of fare to be adopted by her neighbors in a flat. When will the man or woman arise who will gain fame and fortune by inventing a kitchen deodorizer for the especial benefit of people living in apartments and in houses with basement kitchens? The makeshifts to which the close quarters obliged the Goodenoughs to resort were funny enough in the retrospect, although they were anything but droll in the happening. They had to double their belongings up in the most astonishing fashion, and occasionally things got dreadfully mixed. Jenny used to say, despairingly, that she looked forward to finding the frying-pan on the parlor sofa, and her clean collars in the refrigerator, and bore constantly in mind that amusing account of a flat where every piece of furniture was something else than what it pretended to be. Usually she timed her preparations for an outing so that her wraps were laid in readiness some minutes before she was to start. But once she made a miscalculation, and was surprised by the too prompt arrival of a rather fastidious bachelor friend of her husband's who was to accompany them to the theatre. She made a virtue of necessity and carried it off as a joke when she had to ask the guest to rise from the sofa that she might get from under it the box containing her fur cloak, and apologize as she took her best bonnet from the drawer of the antique spider-legged parlor table.

That was a mere circumstance, however, to the shame and confusion of countenance she experienced when another friend of Jim's stopped at the flat early one morning on his way to the office, and found the party costume she had worn the evening before gracefully disposed over chairs in the parlor; while her fan, jewelry, gloves, lace handkerchief, and various similar trifles adorned the mantel and the top of the Franklin. In fact, she was almost always obliged to use the parlor as a dressing-room in the evening, the presence of one baby in the nursery and another in the bedchamber shutting her off from either of these retreats, while the bath-room was so small that if she took an elaborate *tournure* in there with her, she was unable to close the door upon it. It was enough to make one tremble to think of the consequences that would have ensued had she been guilty of the rashness of putting on a beruffled or befrilled gown while actually in the bath-room. She and the gown could never have come out except piecemeal.

Among Mrs. Goodenough's purchases later in the winter was a wardrobe—an essential, if she would not have her best dresses ruined. This she crammed into the nursery, which was already full to overflowing, and then had the pleasure of ducking under the hammock to get a gown whenever she wanted to change her costume during the baby's nap or after his bedtime. Her hair-pins and the meshes of that dreadful hammock had such an affinity for each other that they could never pass without an embrace. Many a time did she crawl across the floor on her hands and knees to avoid the risk of having to take her hair down and rearrange it after the disastrous results that would have followed had she endeavored to reach her goal on her feet instead of on all-fours. When she attempted to take clothing out of the tall closet in her chamber she was in almost as bad a plight. The triple tier of drawers that supported the clothes-press raised it so high that to reach the hooks supporting the dresses she had to scale the heights by means of a hassock and a chair. Precariously balanced on the edge of the latter, in imminent danger of falling and breaking her neck, she would clutch wildly at her prey, which generally hung just beyond her reach. Whenever she descended safe and victorious from her perilous quest, she would draw a long breath of thankfulness that she still preserved her bones intact.

And oh, the noises! Mr. and Mrs. Goodenough were both addicted to rather late hours, and, in consequence, "loved a morning doze." The denizens of the flat above them apparently believed in uncarpeted floors, and although the ceilings were supposed to be deadened, the work had been so imperfectly done that it failed utterly to soften the sounds that began overhead by 6 A.M. A small boy with heavy shoes was usually heard at play half an hour later. His favorite diversion seemed to consist in throwing a wooden ball from one end of the room to the other, then jumping from the cricket upon which he had evidently been perched and running to regain his toy. This pleasing pastime he would continue by the hour at a time. By seven o'clock a melodeon in the same flat would be started with Gospel hymns, of course, and this lasted until one was tempted to turn heathen and fly to the isles of the sea in self-preservation. When the "music," as *Cape Cod Folks* had taught them to call this instrument of torture, was going overhead, while a piano was being practised in the flat below, and a would-be violinist was scraping away in another apartment on the same story, the Goodenoughs felt that their cup of confusion was full.

There were other equally charming features connected with life in a flat which should not be overlooked. One of them arose from the close proximity of the parlor to the nursery. This was the dread of certain callers with loud or high-pitched voices who might happen in during the babies' naps, or worse still, in the evenings. Practice had given the father and mother of the interesting infants the habit of speaking in as subdued tones as would be used in a chamber of sickness, but outsiders could hardly be expected to cultivate this practice, nor did the host and hostess feel inclined to request it. Sometimes the callers would ask, apprehensively, "if any one were ill," and the statement that the babies were easily awakened generally seemed to cast a damper over the enjoyment of the company. It is impossible to be very jovial for any length of time in a forced undertone, and Mrs. Goodenough began to fear that they would lose most of their cheerfully disposed friends if this mode of living were continued much longer.

Apart from these annoyances there were household worries. When a couple of friends were invited to dinner, or when there was an extra course or two, the makeshifts to which the waitress was put in the disposition of the additional dishes forcibly reminded the entertainers of the banquet David Copperfield gave to his friends in his chambers, when the "young gal" who had been engaged by Mrs. Crupp to wash the dishes "carefully paved the pantry floor with plates." The Goodenoughs' maid was reduced to almost similar straits, for as there was no butler's pantry, all the dishes that had been used were carried into the kitchen, and the little space offered by the table and the top of the set tubs was soon covered. Mrs. Goodenough had a broad shelf put up across the window, but even that was not equal to holding all the clean and soiled crockery in service at a lunch or dinner party. That so much of the pretty ware escaped unbroken was a mysterious blessing for which Jenny was deeply thankful.

On washing days the family lived in the steam that, do what they might, would find its way from the tiny kitchen into the dining-room, and it never ceased to be a wonder to them that between the ironing-board and the laden clothes-horse the cook ever managed to cook the dinner on ironing day. And Mrs. Goodenough never could get used to having to pilot her friends past the refrigerator and the flour barrel to get them into the dining-room. Finally, a brilliant thought suggested itself; she had a framework put up, on which she could hang curtains to conceal these homely objects and the shelf above them, and she felt more at ease. With the exception of their musical predilections, the neighbors were, in the main, inoffensive. Still, in every family, no matter how united, there must be occasional differences of opinion, and it is not always the pleasantest thing in the world to be forced into the position of an unwilling eavesdropper to the conjugal disputes in the flat below-stairs or next door. Equally disagreeable is it to be obliged to assist by one's sense of hearing at the spanking the mother of the large family on the first floor is bestowing upon her youngest hope. Yet what can be done when one elevator and one air-shaft connect each one of eight flats with the others?

The arbitrary rules common to flat-houses likewise chafed not a little the young people who had been accustomed to the freedom of their own cottage. Jenny resented having forbidden her the privilege of consulting the grocer's boy or marketman in the privacy of her kitchen, and being forced instead to descend three flights of stairs to a chilly basement. Yet she relished even less the alternative of shouting her orders down the elevator shaft for the delectation of all the curious listeners within ear-shot. One may have nothing to conceal, and yet shrink from publicly announcing her daily menu. As little did she like the regulation that forbade opening the front-door by means of the electric spring until the candidate for admission had screamed her name up the speaking-tube to the maid who answered the call of the bell. The only advantage possessed by this system was the protection it accorded against peddlers, beggars, and book agents. And how both husband and wife longed for a scrap of ground they could call their own, even if it were but the tiny yard that is the only free bit of earth connected with most city houses! What a nuisance it was when a rainy Monday compelled the indefinite postponement of the hanging out of the wet clothes, unless some other tenant could be persuaded to let them have part of the roof on "her day" for drying!

One of the most unpleasant features of living over another family was manifested upon a certain memorable occasion, when Mrs. Goodenough's maid had gone to bed on Sunday night leaving the Monday's wash soaking in the set tubs in the kitchen. By some oversight she neglected the trifling precaution of turning off the water. The mass of wet clothes pressed against the netting covering the waste-pipe, and prevented the escape of the water by that exit. Between five and six the next morning a vigorous knocking at the door aroused Mr. Goodenough to find the janitor half dressed and wholly indignant.

"The water from your pipes has flooded all the other floors," he announced, seriously.

There was an immediate rush to the kitchen by mistress and maids, where they found a flooded floor, an empty boiler, and a stream of cold water flowing from the hot water faucet into the tubs. Luckily, the damage turned out to be less serious than it had appeared at first; but even then it was quite bad enough.

They never did get used to having the lights in the hall put out and the front doors closed by nine forty-five. It was bad enough to have to let themselves into the house and stumble up to their third floor through Egyptian darkness; but even that was not so bad as to usher a caller out at the eminently respectable hour of half past ten, and to feel that unless one of them stood at the head of the stairs to light the guest on his downward way, he would probably break his neck and leave his entertainers morally responsible for his destruction before he reached the front door.

But space and leisure fail one who attempts to recount all the trials the two underwent. They had dreadful suspicions of the janitor's honesty in the matter of coal and kindling wood. Fuel never lasted as long as they thought it should. The electric bells were constantly getting out of order; the stairs were dark; the rugs had to be carried to the roof every time they needed a shaking. The meats and groceries were delivered at the wrong floors, or on the wrong side of the house. They grew tired of climbing so many stairs, and the first floor had fried onions and boiled cod on every day in the week except those on which they had cabbage, and on Sunday they had all three. It was that which decided them finally. They had lived in their flat for eighteen months, and for sixteen they had been glancing with more or less interest at every house they passed in their walks that bore the legend, *To Let*, and when a little frame cottage presented itself—a bit old-fashioned, perhaps, but in which one could at least go upstairs to bed, and down-stairs to breakfast—the Goodenoughs shook the dust of flats off their feet forever, and fled to the refuge which offered them a front and a back door all their own.

SENATOR SANDERS.

On the last day of the old year the Republican caucus of the Montana Legislature nominated Colonel Wilbur Fisk Sanders as United States Senator, and he was elected the following day by the Republican Legislature. As his title will be passed upon by a committee on elections a majority of whose members are Republicans, it is fair to assume that its validity will be recognized.

Colonel Sanders is one of the most picturesque figures of the new Northwest. He was born in Cattaraugus County, New York, in 1834, and in 1854 began his legal education under his uncle, Sidney Edgerton, of Akron, Ohio, one of the most prominent lawyers of the Western Reserve. He married Miss Harriet P. Fenn in 1858. He served in the army until 1863, when he retired on account of broken health, and went to Idaho, whither his uncle had preceded him as Governor of the Territory. The next year the Territory was divided, and Mr. Edgerton became Governor of Montana, and young Sanders settled in Virginia City. He soon became prominent as a lawyer, and was chosen Prosecuting Attorney. In this office he distinguished himself by his ability and absolute fearlessness. In 1868 he removed to Helena, Montana. Montana in those days was infested with "road agents," and it was due to him, in no small degree, that the famous "Vigilantes" succeeded in restoring the reign of law and order in the Territory. He brought the notorious Slade to justice, and it was on his motion, when there was some hesitation about the carrying out of the sentence imposed by the improvised court of the Vigilantes, that the murderer George Ives was "forthwith hung."

Colonel Sanders is a pronounced partisan, and in his political speeches he often refers to his Democratic opponents as "the left wing of Price's army." He will be a hearty supporter of a Federal election bill, and in general of all "bloody shirt" legislation. He is one of the readiest impromptu talkers in the country, and many stories are told of his marvellous power of extempore eloquence. He is equally at home before a Vigilance Committee, a board of railway directors, a Browning Society, or a political mass-meeting. Colonel Sanders has been a recognized leader of the Republican party in Montana for twenty-five years. He was a member of the Territorial Legislature in 1872, '74, '76, and '78. Several times he has been the candidate for Territorial Delegate to Congress, but has failed to overcome the Democratic majority. His nomination for Senator by the Republicans was almost a foregone conclusion. He is the foremost man in his party in Montana, and is likely to make his mark in the Senate at Washington.

CHANCELLOR HENRY R. PIERSON, LL.D.

Chancellor Pierson, who died at Albany on January 1st, was an exemplary type of that sturdy and solid worth which appeals to the esteem of all classes of the community. During his long life of usefulness he had filled many positions of the highest trust and importance, and so filled them as to be a model for his fellows. He fell a victim to an attack of capillary bronchitis, induced from the prevalent influenza. He had been ill for only eight days, and till within a very brief period before his death his condition had not been esteemed dangerous.

Chancellor Pierson was born at Charleston, Montgomery County, New York, on June 13, 1819, of sturdy farmer stock. All his early years were spent in rustic pursuits, and the exercise obtained in out-door life probably contributed largely to the sturdy physique which characterized him. Farm life, however, did not prevent him from giving time to the cultivation of that love of books to which his tastes led him. He had already acquired a marked degree of self-education when he left home at the age of twenty-one to teach school at Salem, New York, with the idea of earning money for the discharge of his college expenses. He was enabled to enter Union College in 1843 in the Sophomore class, and graduated with honors in 1846. In his class were several men who afterward became notable, such as John M. Gregory, Governor John T. Hoffman, and Howard Potter. After a brief period of law study in Cherry Valley, the young man entered the office of Judge Gilbert M. Speir, in New York city, and was admitted to the bar in 1848. He at once formed a law partnership with Hon. Abijah Mann, which lasted for many years, and made the firm one of the best known in New York. The attention of Mr. Pierson, however, was quickly turned to railway matters, for which he seemed to have a special talent. He resided in Brooklyn from 1849 to 1869, and during that period served as President of the Board of Education, and likewise of the Board of Aldermen, in both of which offices he secured the warm approval of his fellow-citizens. He was also elected a State Senator for his district in 1866, and served with great usefulness. He had retired from legal practice in 1860, and became President of the Brooklyn City Railroad. This position he held for nine years, till he was persuaded to go West to assume the functions of financial agent of the Chicago and North-

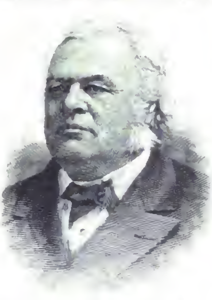
COLONEL WILBUR F. SANDERS, SENATOR-ELECT FROM THE STATE OF MONTANA.—[See Page 31.]

western Railroad. He speedily discovered such ability that he was made Vice-president of the company, and filled that office for two years. Mr. Pierson then returned East to assume the duties of managing director of the New York Central road, and thenceforward made his home at Albany. Two years later, in 1873, he was elected to the Assembly, where he held the chairmanship of two of the most important committees—Cities and Railways. As a man of business he did not, however, confine his attention to railway management, but instituted a successful banking establishment, with which he remained permanently identified.

He had always been warmly interested in questions of education. In 1870 he had been elected a trustee of Union College, of the Albany Medical College, and of the Dudley Observatory. The Legislature in 1872 made him a Regent of the University of the State of New York, in which position he succeeded Erastus Corning. He was appointed to the Vice-Chancellorship in 1878, when Erastus C. Benedict became Chancellor; and when Mr. Benedict's death in 1881 made a vacancy in the Chancellorship, Mr. Pierson was at once promoted to this important and responsible place, which he has since filled with great ability and judgment.

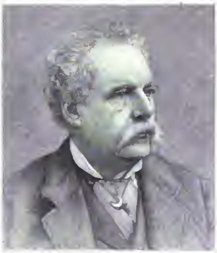
Chancellor Pierson was a man of fine physique and impressive personal aspect. The singular geniality of temperament which softened his dominant qualities of energy and force made him as warmly beloved by his friends as he was universally esteemed. His early experiences in farming life left him strongly attached to rustic pursuits, and during the closing years of his life he was much interested in carrying on practical and experimental farming on the fine country estate near Albany which he possessed. He was a fine type of executive energy united with cultivated and vigorous intellectual qualities, and a man of great public capacity. He received the degree of LL.D. in 1874.



THE LATE HENRY R. PIERSON, CHANCELLOR OF THE BOARD OF REGENTS OF THE UNIVERSITY OF THE STATE OF NEW YORK.—From a Photograph by Sterry, Albany.—[See Page 31.]

GEORGE HENRY BOKER.

Mr. G. H. Boker, honorably known as poet, dramatist, and diplomat, died on January 2d, in the sixty-seventh year of his age, at his residence in Philadelphia, of a throat affection, from which he had been suffering for several years. He had been confined to his bed for nearly a month, and the fatal termination of his illness was unexpected, as he had rallied only a few days before his death in a way to promise convalescence. Mr. Boker, born in 1823, belonged to a wealthy Philadelphia family, and inherited the easy and graceful culture which stamped his literary work. His ancestry, originally French, was also partly Dutch by removal to Holland, and finally became located in England. The family then became identified with the Quaker sect, and on coming to America, settled naturally in Philadelphia. His father was a noted financier, and he himself became the heir of an ample fortune at an early age. He was graduated at Princeton College in 1842, in the same class with Theodore L. Cuyler, John P. Stockton, Senator Colquit, and Charles Godfrey Leland. He finished his studies at the age of nineteen, and wedding shortly after a Miss Riggs, he went abroad for prolonged travel. His literary tastes, which had been pronounced in college, rapidly ripened into productive work, and in 1848 his first volume of poems, *The Lesson of Life*, was given to the public. The following year came a tragedy, *Calaynos*, based on a Spanish story, which was very favorably received, and it was also a play of acting merit, as it was put on the stage in both England and America. There followed within a few years *Anne Boleyn*, *Leonor De Guzman*, and *Francesca Da Rimini*. The latter-named drama, originally produced, at the Broadway Theatre in New York, in 1855, with E. L. Davenport as Lanciotto, was very successfully revived in 1883 modified by the author, and it by Lawrence Barrett, in a form became a permanent feature of the actor's repertory. Other plays written by Mr. Boker, though never acted, were *The Betrothal* and *The Widow's Marriage*. His books of collected poems, in addition to *The Lesson of Life*, were *Plays and Poems* (1856); *Poems of the War* (1864); *Street Lyrics* and *Königsmark and Other Poems* (1869); and *The Book of the Dead* (1882).



THE LATE GEORGE H. BOKER, OF PHILADELPHIA.

Mr. Boker from the outset of the civil war was an ardent patriot and a prominent member of the Republican party. In association with Morton, McMichael, and a few others, he founded the Union League Club in 1862, and this soon became a power in war politics. He was such an uncompromising Unionist that he was drawn into more than one bitter feud, and it was said that his life was several times threatened by political enemies. His diplomatic career began in 1872, when President Grant gazetted him as minister to Turkey; here Mr. Boker displayed at once brilliant aptitudes for his new profession. He interested himself in securing certain needed reforms in the jurisdiction of native courts in Turkey and Egypt over foreigners, and valuable decorations and gifts were urged on him by the Sultan and the Khedive, honors which he was obliged to decline. Thence he was promoted, with the most flattering testimonials from the State Department at Washington, to the St. Petersburg mission, and in this new field he acquitted himself with such tact and ability as to win the warmest esteem of the Emperor and his chancellors. It was through Mr. Boker's negotiations that Russia, Turkey, and Egypt took part in the Philadelphia Exposition in 1876, and that the Czar announced himself so emphatically on the side of the United States at the time of the *Virginius* trouble. He was in the diplomatic service for six years, and it was said that Alexander and his Chancellor, Prince Gortschakoff, made a personal request that he should not be removed.

After Mr. Boker's withdrawal from diplomacy he ceased to be connected with public life, and occupied himself with social and literary interests. His culture and polish as a man of the world made him a notable figure, and the impression he produced was heightened by a noble physique and carriage. His poetic faculty, which is his title to literary remembrance, vibrated with no lofty and original strain, but flowed with an easy and affluent grace, marked by extreme finish, and not without occasional outbursts of a genuine fire, which give him honorable rank among the *dii minores* of American verse. Some of his shorter poems, such as "Sheridan, Sheridan, Cavalry Sheridan," "The Ivory Carver," "The Podesta's Daughter," and "A Dirge for a Soldier," rose at once to a popularity which has remained permanent.

THE MONEY MARKET ONCE MORE.

Those who are concerned in the financial business centring in New York for which the common and convenient name is Wall Street, will admit that the money market of the end of December and beginning of January deserves a chapter to itself. People at a distance, if engaged in business so as to know by experience the difference between tight and easy money, will be interested to know how matters went in New York round the turn of the year, and probably congratulate themselves on being elsewhere and differently occupied. Preparations for January disbursements were larger than usual, and the gathering together by a very large number of corporations of the money needed to pay their coupons on the first business day of January caused, as usual, some curtailment of facilities among borrowers. The banks themselves, in spite of their slender reserves, were obliged to increase their loans, and in general they did all that could reasonably have been expected of them in that respect. The rates for call loans became irregular; some institutions taking a pride in not raising their charge above 6 per cent. interest, while others, acting with the freedom of private lenders, took all they could get—25 per cent. or more. The Treasury had upward of eight millions of interest to pay at the beginning of January, and this amount was of vastly more importance to the market than any similar sum from corporations, because it was to come out of the Treasury vaults, and be so much clear addition to the money afloat. The importance of getting this money out in advance of the due date, and while the necessary preparations for ordinary payments of interest were on foot, was urged upon the Treasury. On Saturday night, December 28th, notice was sent out from the Treasury that checks for over seven millions of interest had just been mailed, and that quite possibly by Monday or Tuesday the Secretary might order them cashed at once, as a convenience to holders, but not with any reference to supposed stringency in the money market. This affectation of indifference to notorious facts was brushed away on Monday morning, December 30th, and by noon of that day the Assistant Treasurer at New York was instructed to cash the January interest checks and coupons as soon as presented. The relief was given as late as it could well be, and was given grudgingly. The comments current on Secretary Windom's action and its manner would not look well in print; but it would have been worth his while as a public officer to hear them. When business was resumed yesterday, after the New-Year's holiday, rates were anywhere from 10 to 40 per cent.; the highest rate being late in the day, and ascribed to manipulation of its own loans by one of the national banks. This afternoon money fell to 4 per cent., and closed easy at that figure or less, though most of the day's business had been at 12 to 15 per cent. It is not certain that this return to ease will last, though it seems that there is an increased disposition to promote ease in money, and this is important when bank reserves, as now, are slender.

The market for call loans in New York is very important; the loans are made on pledge of good stocks and bonds current at the Stock Exchange, and of market value 20 per cent. or more in excess of the money borrowed. They constitute the means of meeting the fluctuating demands from day to day of the financial houses and their thousands of clients all over the country. It is as legitimate a branch of the money market as that for commercial discounts, or that for time loans on pledge of collateral security. It cannot be evaded by taking time loans instead, for the reason that the amounts involved vary too greatly to permit of the substitution of that kind of borrowing. And it is an unfortunate feature of it that most of the borrowing has to be done in the service of clients who will not pay more than the legal rate of interest, which is 6 per cent. It is lawful in New York to agree upon any rate of interest for demand loans of $5000 or upward, but this is so recent that the client still plants himself upon the legal rate; and, besides, there is no official rate to which reference can be made. The latter defect may perhaps be remedied, but not until the banks agree upon a uniform rate for first class call loans, announced day by day.

What, then, can be done to improve the present state of things? Improvement is certainly needed, as the rates just quoted are penal, though these and worse are familiar to every one of long experience in New York. The main thing is to get out of the Treasury the money which lies there in excess of sound business requirements. The purchase of bonds and the deposit of Treasury money in national banks are the two resources of the Secretary; but the offerings of bonds have been trifling for several days past, and Mr. Windom has pronounced against deposits in national banks with as much emphasis as if he had never read the Currency Act of 1864, which authorizes them. It would be a great relief if the fund in the Treasury for the redemption of surrendered bank-notes, now sixty-nine millions, could be rapidly reduced. All the details of the surrender of bank-notes are known to the Currency Bureau, and this knowledge, one would suppose, could be turned to account in hastening their redemption, and consequently the liberation of the impounded lawful money, if only the official mind could be convinced of the importance of time in this respect. The money market will do the best it can with the funds in its own control; let the Treasury yield up its idle hoard, and nothing more can be asked. But Mr. Windom must administer the Treasury with full use of his lawful powers of relief, or he will find that a large reduction of taxation is more vital to himself than even to the rest of us.

Henry J. Macdonald.

New York, Friday evening, January 3, 1890.

POOR HUMANITY!

The common lot is one of sorrow say—at least—the pessimists, they who look at the worst side. Certainly what would otherwise be a bright existence is often shadowed by some ailment that overhangs it like a pall, obscuring perpetually the radiance that else would light the path. Such an ailment, and a very common one, is nervousness, or, in other words, weakness of the nervous system, a condition only irremediable where inefficient or improper means are taken to relieve it. The concurrent experience of nervous people who have persistently used Hostetter's Stomach Bitters is, that it conquers entirely supersensitiveness of the nerves, as well as diseases—so called—which are invited and sustained by their chronic weakness. As the nerves gain stamina from the great tonic the trouble disappears. Use the Bitters for malaria, rheumatism, biliousness, and kidney troubles.—[*Adv.*]

IMPERIAL GRANUM

is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[*Adv.*]

ADVICE TO MOTHERS.

Mrs. Winslow's Soothing Syrup should always be used for children teething. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. 25c. a bottle.—[*Adv.*]

A SPECIFIC FOR THROAT DISEASES.

Brown's Bronchial Troches have been long and favorably known as an admirable remedy for Coughs, Hoarseness, and Sore Throat. They are exceedingly effective. Sold only in boxes. Price, 25 cts.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Nocumann's Liquid Bread is a pure malt extract, containing less than 3 per cent. of alcohol. It meets the popular want, and is for sale by all druggists. Its rapid and constantly increasing sale proves that its merit is appreciated.—[*Adv.*]

CORNELL'S BENZOIN COSMETIC SOAP

Whitens the hands, softens the skin. 25 cts.—[*Adv.*]

Beecham's Pills.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[*Adv.*]

We recommend the use of Angostura Bitters to our friends who suffer with dyspepsia.—[*Adv.*]

Dr. Lyon's Perfect Tooth Powder. Whitens the teeth and purifies the breath. 25 cents.—[*Adv.*]

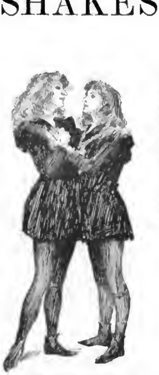
USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

The weakness and debility which result from illness may be speedily overcome by the use of Ayer's Sarsaparilla. This is a safe, but powerful tonic, assists digestion, regulates the liver and kidneys, and cleanses the blood of all germs of disease.—[*Adv.*]

SHAKESPEARE IN NEW YORK.

BY WILLIAM WINTER.

WITH SKETCHES FROM LIFE BY ALBERT E. STERNER.



MAY HAINES AND ISA BOWMAN AS THE TWO PRINCES.

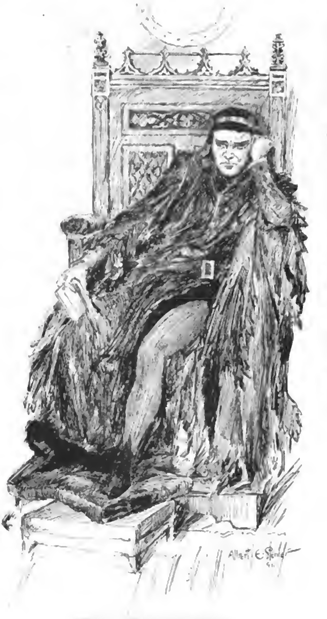
THE stage in New York city has seldom made such an interesting manifestation as it makes at present of the resources of dramatic and scenic art as applied to the works of Shakespeare. *As You Like It* has been produced at Daly's Theatre, with Miss Ada Rehan as Rosalind. *Richard the Third* has been produced at Palmer's Theatre, with Mr. Mansfield as Gloster. *Twelfth Night* has been produced at the Fifth Avenue Theatre, with Miss Marie Wainwright as Viola. In each case the effort has been made to give the play not only a correct and impressive stage setting, but an intellectual, sympathetic, and adequate interpretation. These three presentations of Shakespeare came simultaneously, and have progressed side by side, and all of them have prospered. The successful result of this form of theatrical enterprise is a denotement equally of potential artistic achievement and of popular appreciation.

The audience for the best things in art has always been a small audience. Milton described it as fit though few. It may be doubted whether the public ever attends a Shakespearian performance, or any performance, in the first instance, for the sake of its artistic merit. An extraneous allurement of some sort must first exist to awaken public interest. When once the attention of the community is obtained, the artistic charm may suffice to hold it. Mr. Mansfield was a long time in building up his personal reputation; in diffusing knowledge of the fact that he is an exceptional actor; in convincing the people that whatever he undertakes to do will be done in a unique manner—a manner marked by distinctive and piquant attributes—and therefore will be worthy of regard. He was a public performer for many years before he gained his first great success with the remarkable embodiment of Chevrial in *A Parisian Romance*. He supplemented that with his ghastly, terrible, pathetic, and darkly imaginative impersonation of Dr. Jekyll and Mr. Hyde, and with that achievement his preparatory work was complete. The community might not, and probably would not, have cared to see Shakespeare's tragedy of *Richard the Third*. It is a boisterous and repulsive play, and it has never been popular. Certainly no considerable "business" has ever been done with it except for brief periods, with Edmund Kean, G. F. Cooke, and the elder and younger Booth; but no sooner did Mr. Mansfield announce himself as Gloster than the public mind became excited with an eager desire to see him play it. He first acted the part in London, at the Globe Theatre, about a year ago, and subsequently returning to America, which is his home, he began his present theatrical season with it last October, in Boston. Mr. Mansfield, it should be said, has had his career on the English as well as on the American stage. He was born in Heligoland, and is the son of the once famous vocalist Madame Rudersdorf. But practically he is an American, and his rank is with American actors.

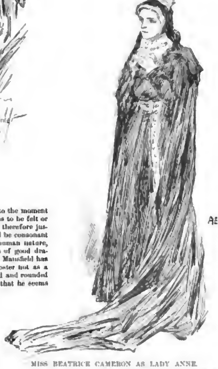
In choosing his characters for the stage, Mr. Mansfield has hitherto acted upon a principle which eventually he will be constrained to abandon. He has ignored the element of human sympathy. The types of human nature that he has chosen to depict are, in the main, obnoxious types. No actor has ever yet succeeded in holding a high and permanent place in the regard of mankind through the assumption of monsters. An actor may momentarily startle and thrill the human heart in such characters as Iago, Iachimo, Ludovico, Pescara, and Sir Giles Overreach, but he cannot permanently hold it in them. If his fame is to be universal, genuine, and continuous, he must inspire affection as well as admiration. It is not a question of desert; it is a question of radical law. Edwin Booth's great fame, for example, was not gained in Iago—of which part his embodiment is peerless—but in Hamlet and Richelieu and King Lear. Jefferson's consummate victory was won not with coarse, eccentric comicalities, such as Shingle and Batkins and Paul Pry, but with the poetical and lovable character of Rip Van Winkle. An actor who possesses them will always be admired for his genius and his artistic capacity; but the extent, continuity, and growth of his success, making him an integral part of the vital experience of his time, depend on his assumption of characters that are sympathetic. The late John Gilbert gave a marvellous performance of Caliban; but this community knew and admired and loved him, not for his Caliban, but for his Dornton, Sir Peter Teazle, and Jesse Rural. Henry Irving gives a great embodiment of Louis XI.; but his place in the hearts of this generation was gained by his performances of Mathias, Lesurques, Hamlet, and Dr. Primrose. Mr. Mansfield has now gained the public eye and the public confidence. No other young actor stands in a more auspicious attitude toward the tragic stage and the society by which it is valued and sustained. But Mr. Mansfield will surely find that he cannot successfully restrict himself to the representation of demons.

His choice of Shakespeare's Gloster, however, viewed in the light of his peculiar and exceptional treatment of that character, was a step in the right direction. He seems to have recognized instinctively the need that exists of presenting this character not simply as hateful, but also as pitiable. He does not obscure or soften its enormity; but he has tried by a strong accentuation of Richard's remorse, and by a vigorous and pathetic portrayal of the struggle between good and evil in this man's soul, to make him, to a certain extent, an object of compassion. His work is meant to be the portraiture of a man, and not of a malignant reptile. It may be that this ideal is somewhat inharmonious with Shakespeare's conception. But *Richard the Third* is not one of Shakespeare's most definite tragedies. Its style is diffuse and vagrant. It makes a wild jumble of historic events. It distorts facts and builds largely on rumors and surmises. It does not express the poet's conception of Richard's character with absolute and incessant distinctness. It makes Richard describe himself in such terms that if he were taken at his word, and depicted according to his own description, he would appear as a hideous combination of Quasimodo and Quilp. Its greatest dramatic effect is dependent on the operation of remorse in the soul of a murderer, and yet it leaves even the most studious of its readers completely in the dark as to the moment when the remorse of Gloster begins to be felt or to affect his conduct. The actor is therefore justified in forming an ideal that shall be consonant with a sound general theory of human nature, and that can be made productive of good dramatic effects. This is all that Mr. Mansfield has ventured to do. He presents Gloster not as a character that is entirely developed and rounded (as it must, however, be admitted that he seems to be in Shakespeare), but as a character that is being developed; and he makes Gloster's mental and spiritual perturbation almost coincident with his commission of the crimes that mark his course. This is the distinctive novelty of Mr. Mansfield's embodiment. He has arranged the piece, in five acts, partly according to the original, and partly according to the plan that was adopted by Cibber. His book is not so good a one—because not so faithful to Shakespeare, and not so conservative of the pivotal effects and splendid passages of the original piece—as that which was made by Edwin Booth about fourteen years ago; yet it is a good book, scholar-like and practical. He introduces Gloster at the age of nineteen, in the year 1471; and thereafter he intimates lapses of time, denoting their effect by certain changes in Gloster's aspect and demeanor, and presents him later, at thirty and thirty-three. By this means he is enabled to aim attention not only to Gloster's deeds, but to the emotions that commingle and contend in his soul.

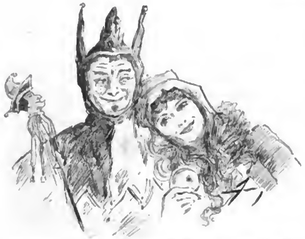
No previous actor has done this, in the whole long history of Shakespeare's play, the invariable custom having been to make the character all alacrity, expedition, infernal self-poise, and deadly will, until the ghost scene on the night before Bosworth Field, and then suddenly to display it in agony and collapse. Edmund Kean, to be sure, introduced the weird and blood-curdling effect of dark presentiments in the king's mood just before the tent scene, and Edwin Booth, by a subtle and magnificent stroke of genius, indicated the beginning of Richard's discomfiture as coincident with his audit of his mother's curse (in the fourth scene of Act IV. in the original piece). But the stage custom has been the presentation of a concrete character, finished and continually in rapid action, and not a character unfolding itself, with the concomitants of physical alteration, under the pressure of experience. The stage Richard of the past was a specious hypocrite, a sardonic scoffer, and a resolute, cruel, and "sudden" brute. His cool and glittering malice and his smiling treachery were almost comical, but he never became interesting as a man till just before the end of his career. Mr. Mansfield, without ceasing to present him as a hypocrite, a scoffer, and a miscreant, has tried to present him all the way through as a man. There may not be positive and absolute authority for this in the original text of Shakespeare, yet it ought to be remembered that the drift of that text is not definite. Besides, the justification of an actor's method must be sought in the effect it produces. Mr. Mansfield's treatment of the part abates its impetuosity during the earlier scenes, and this is a defective result; but during the later scenes—in fact, from an early point in the progress of the story—it insures for his embodiment of this haunted murderer the human interest that might naturally follow a man who is haggard in suffering no less than nimble in crime. The performance is somewhat deficient in superficial animation. This Richard does not "bustle," and is not sufficiently the man of whom it is so significantly said that "ills by him but thought are half performed." But the performance is deeply and darkly freighted with the portraiture of introspection, and with the thrilling and informing aspects of a human experience at once terrible and pathetic. Mr. Mansfield has contrived a scene in the throne-room just after the king is apprised that his nephews have been murdered which is at once weird, grim, and touching in its portrayal of the lonely anguish of victorious crime, and which, alike in its plan and



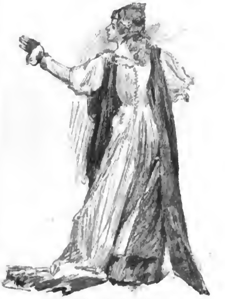
RICHARD MANSFIELD AS RICHARD III.



MISS BEATRICE CAMERON AS LADY ANNE.

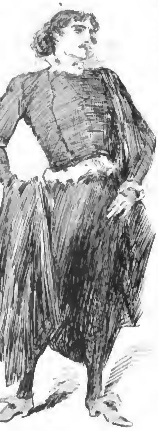


JAMES LEWIS AS TOUCHSTONE, AND MISS ISABELLE IRVING AS AUDREY.



ADA REHAN AS ROSALIND.—*Act I.*

its details, is worthy of an actor of the most subtle insight and the finest executive power. The subsequent dream scene, wherein the king lies asleep, writhing in agony, while the dim ghosts of his victims drift upon the misty air through the tents of his midnight camp, comes as the natural sequence of this convulsive visitation of terror and remorse, when in the darkening hall of state a single ray of sunset light pierces through the tall Gothic window and smites the monarch's hand with the malediction of innocent blood. The frenzied awakening, likewise, when, as played by Mr. Mansfield, Richard for one horrible moment mistakes the literal figure of Catesby for yet another spectre, is likewise in the direct sequence of this exposition.



JOHN DREW AS ORLANDO.

Mr. Mansfield has not hesitated to borrow from a more authentic history of Richard's life than that which is intertwined with Shakespeare's tragedy certain side-lights with which to illumine his image of the slandered king. His great sigh of sorrow when saying that Queen Anne is dead is meant to denote the bereavement of love. But this is not warranted in Shakespeare. The play cannot be squared with history. There is not the slightest evidence, for example, to prove that Henry the Sixth was slain by Richard. There is not the slightest evidence to prove that Clarence—who indeed was tried and condemned by his peers—did not die a natural death when he expired in the Tower. And whatever may have been the fate of the sons of Edward, it was not the Duke of Gloster, but his enemy the Duke of Buckingham, who seems to have been at the bottom of it. The mother of those boys, it is not denied, subsequently placed herself in Richard's power—coming out of sanctuary, wherein she might safely have remained—and agreed to the marriage of her daughter with his son, who died in boyhood. And as to Anne Neville, it is certain that Richard loved her dearly, and that the immediate cause of her demise was grief for the death of their child. It is useless, however, to go into this branch of the subject. Shakespeare has followed Sir Thomas More in blackening for all time the character of this prince, and Shakespeare's portrait will never be invalidated. Besides it is Shakespeare's Richard and not the Richard of impartial history that Mr. Mansfield has undertaken to interpret, and his road accordingly lies more or less between hedges. He has aroused a wide-spread interest and stimulated lively discussion, and this is not confined to the circles of Shakespearian scholarship. The production is eminently one that was intended for the people. It contains fourteen scenes, no one of which is over-long, and these are set in eleven stage pictures of great beauty, painted by William Telbin, Bruce Smith, and E. G. Banks. The opening scene, in which no words are spoken, is a picturesque and spirited view of the Tower of London, gorgeous in brilliant morning sunshine, with its gay standards streaming in the fresh summer breeze, while a richly diversified procession, escorting Elizabeth, queen of Edward IV., enters beneath its grim embattled gate. Throughout the piece English architecture of the fifteenth century is copied with great fidelity. The wooing of Lady Anne is shown to occur in a sweetly pastoral bit of the road toward Chertsey, the city of London, with old St. Paul's spire, being dimly visible in the distance. The state chambers are massive and opulent, and a profound effect of haunted gloom and grisly menace has been created in the composition and color of the camp scene and the battle-field. Mr. Mansfield ends the piece with a combat based on the spirited narrative of Hume. The principal features of the cast are Lady Anne by Miss Beatrice Cameron, Queen Elizabeth by Miss Ada Dyas, the Duchess of York by Madame Ponisi, the Duke of Buckingham by Mr. D. H. Harkins, Lord Hastings by Mr. Druce, the Prince of Wales by Miss May Haines, and the Earl of Richmond by Mr. Atkins Lawrence. Miss Cameron's performance is especially thoughtful, fervid, and sincere.

Against the one Shakespeare tragedy stand the two Shakespeare comedies. In his production of *As You Like It* Mr. Daly undertakes a peculiarly bold venture. This is not the first time that this sagacious and energetic manager has brought out *As You Like It*, for it was he who introduced the beautiful Mrs. Scott-Siddons to the American stage as Rosalind twenty years ago, and it was under his management that Mrs. Clara Jennings and Miss Fanny Davenport severally first appeared here in that character. But *As You Like It* has been frequently performed within the last twenty years, and it is not as fresh a piece for the public as several other Shakespeare comedies are that might be named. Furthermore, because of its delicate, dream-like character, its poetical atmosphere, and its evanescent beauty, it is a piece that never could be counted on as certain to please the people. Mr. Daly, however, had this strong allurement to offer—that he could present Miss Ada Rehan as Rosalind, and that he could announce such a production of *As You Like It* as should prove a worthy companion to his fine revivals of *The Merry Wives of Windsor*, *A Midsummer-Night's Dream*, and *The Taming of the*

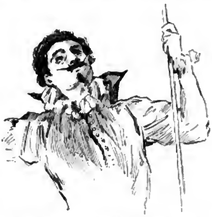
WILLIAM P. OWEN AS SIR TOBY BELCH, AND PERCY BROOKE AS SIR ANDREW AGUECHEEK.



BARTON HILL AS MALVOLIO, *TWELFTH NIGHT.*

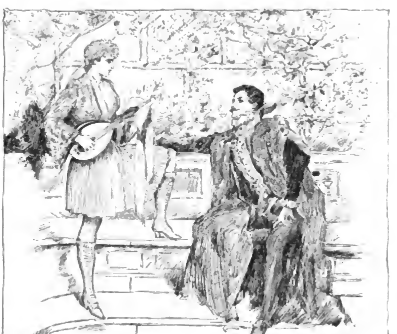
Shrew. His proclamation proved amply efficacious. The desire to see Miss Rehan as Rosalind was general and eager, and once seen his presentation of this delicious pastoral play was found to be invested with altogether exceptional attributes of novel charm, and therefore a spectacle to be witnessed as often as possible. For the first time in its history this piece has been dressed in one invariable garb of spring. The spectator sees no color that is not soft, tender, and pleasing; hears no sound that is not glad; and apprehends nothing but jollity. No mournful sentiment of exile is permitted to tinge those free and airy forest scenes with even a fleeting shadow of regret. No "melancholy Jaques," substituting ponderous solemnity for quizzical cynicism, is allowed to drench the happy foresters of Arden with the oratorical sonority of a funeral sermon. Even the old English melodies that are interspersed through the piece are slightly quickened so that they may not strike the chord of sadness. Since the object of the play, howsoever intertwined with a purpose of whimsical pleasantry, is the exposition of righteous and fortunate love, since the current of it ripples along in a silver rivulet of mirth, and since the culmination of it is absolute happiness, nothing in the stage investiture or treatment of it should be even momentarily chilled with sorrow. This is the ground-plan of the revival, and this plan has been perfectly accomplished. Not a single false note occurs, unless it be the epilogue—which does not sound like Shakespeare—which was written for a boy to speak, and which is but a paltry tag to such a lovely play. Certain rank lines usually spoken by Touchstone are omitted. That ancient blemish "The Cuckoo Song," which was foisted upon this piece in Garrick's time, has been removed, while all the music for which Shakespeare provided is retained. The two pages appear and sing for Touchstone "There was a Lover and his Lass." The passages descriptive of Jaques and the "poor sequestered stag" are restored to the First Lord, and are spoken in their proper place. An actor and not merely a gymnast is cast for Charles the Wrestler. Much new and felicitous stage business is interpolated. The second act is ended with the song of the winter wind. And by a skilful blending of set pieces with panorama the effect is secured of boundless extent and opulent luxuriance in the breezy clearings and sun-dappled glades of the fanciful forest of Arden.

With the single exception of Lady Macbeth, no woman in Shakespeare is so much in controversy as Rosalind. The character is thought to be almost unattainable, and for an actress to attempt Rosalind who has never yet played the part is deemed an act of temerity. An ideal that is lofty, but at the same time is vague, seems to possess the Shakespeare scholar, accompanied by the profound conviction that it never can be fulfilled. Only a few actresses have obtained ample recognition as Rosalind, chief among them being Mrs. Pritchard, Peg Woffington, Mrs. Dancer, Dora Jordan, Louisa Nesbitt, Helen Faucit, Ellen Tree, Mrs Barrow, Rose Coghlan, Mrs. Kendal, Mrs. Scott-Siddons, Mrs. Langtry, Miss Litton, and Mary Anderson. Others have attempted it, but with no appreciable advantage of result. There are obvious difficulties in the way of giving a fine performance of Rosalind; and yet the character is not obscure. Shakespeare built the comedy of *As You Like It* upon the basis of a romance, partly in prose and partly in verse, by his contemporary, Thomas Lodge (it was published in 1592, dedicated to the Lord of Hunsdon), called, "Rosalynde: Euphues Golden Legacy: Found after his death in his Cell at Silexedra: Bequeathed to Philautus Sonnes nursed up with their Father in England." In that book he found the story that he has told in his play, elevating it, and adding to it the characters of Jaques, Touchstone, Audrey, and Sir Oliver Mar-text. That story of a wild girl frolicking in the woods suggested to his imagination the image of the unconventional woman whom all free-minded men adore. The charm of Rosalind is her gypsy charm. She is young, handsome, pure, merry, and noble, and beneath a sparkling outside of nimble wit, smiling levity, and amiably satirical banter she veils a passionate temperament, sensitive to every fine impulse and every lovely influence. The reason why she is not more often embodied in a competent and enthralling manner is that her enchanting quality is something that cannot be assumed—it must be possessed; it must exist in the fibre of the individual, and its expression will then be spontaneous. Art can accomplish much, but it cannot supply the inherent captivation that constitutes the puissance of Rosalind. Miss Ada Rehan has made a brilliant hit in the part, first, because she possesses this quality, and, secondly, because the method of her art is the fluent method of natural grace. She does not try to be anything more than a woman. She does not grope after abstract meanings. She dashes into the woodland frolic in a mood of gleeful happiness; and the image of buoyant womanhood that she embodies is sweetly reckless, because absolutely innocent as well as ardently impetuous. The performance is marked by incessant movement and sparkle, and yet it does not become monotonous or insincere, because it is so continuously fraught with suggestiveness of the pure, wholesome, simple, happy, and bounteous nature that is beneath it. Those courtship passages in the forest, wherein the boy plays the woman, drag wearily when the Rosalind is not the actual woman of Shakespeare's dream. In Miss Rehan's hands they run with the sparkle of the brook in spring-time. Her spirit is in the personation, and her spirit brims over with its affluence equally of feeling and of frolic. Rosalind is not one of the cold experimental women who stop short with wishing to be loved; she is herself a lover, and the crowning ecstasy of her beautiful life comes in that golden hour when at length she is sure of Orlando's fidelity. Few emotions that women feel are of a more sacred character than this one that must be experienced and conveyed by the representative of Shakespeare's favorite heroine. Miss Rehan has obtained a great and lasting success in her art because she rises naturally to the height of this character and sustains herself easily at that poise. The excellence of the impersonation will of course be disputed at first; but this is only another sign of its merit. Such a work cannot be injured by the shafts of detraction. It passes into the history of the stage, and it will abide there.

The popularity of *As You Like It* at Daly's Theatre has been enhanced by the associate performances of Orlando by Mr. John Drew, Jaques by Mr. George Clarke, Adam by Mr. Charles Fisher, Touchstone by Mr. James Lewis, the exiled Duke by Mr. Charles Wheatleigh, Sylvius by Mr. Frederick Bond, and Celia by Miss Henrietta Crossman. The idea of Jaques as a blasé man, a dreamer, and a cynical moralist who is done with the world except to rail at it, was perfectly conveyed by Mr. Clarke, whose audience had the luxury of hearing that fine speech on the seven ages of man spoken as if in a half-unconscious mood of thinking aloud, and not with the pomp and flourish of declamation. Celia also is rightly and effectively acted by Miss Crossman. It is in Celia, and not in Rosalind, that Shakespeare has, according to the text of the original, given the slightly carnal touch of physical exuberance. She is fine, but she is not of the fine strain of Rosalind. When Garrick revived this piece she was cast to Kitty Clive, whose strong point certainly was not sentiment. Celia needs force, mischief, and animal piquancy. Miss Crossman expresses perfectly well her tantalizing disposition and her satirical gayety of mood. The dry humor of James Lewis is harmonious with Touchstone, and this fine comedian, as thoughtful as he is droll, has given a true image of the wag in motley who uses his folly as a stalking-horse, and shoots from behind it the arrows of his wisdom. Mr. Drew's impersonation of Orlando will be remembered as a form of grace and sentiment, picturesque in moving and impetuous in spirit, and carried with the easy skill of a trained comedian. The musical part of this revival is delicious.

In his comedy of *Twelfth Night* Shakespeare takes a stronger grasp upon common life than he does in *As You Like It*. The scene is no longer the forest of Arden; it is the city and the court. The poetic ideal of sweet, tender, and melancholy loveliness in woman could not, indeed, be more amply and beautifully expressed than it is in the character of Viola; but the predominant types of human nature in this comedy are humorous types, and these are wonderfully rich and strong. When Adelaide Neilson was alive to play Viola, her exceptional temperament—in which passion and glee contended like the cloud and sunshine of an April day—enabled her to animate the scenes of sentiment with an enthralling charm such as no puissance of humor could eclipse. While she was on the stage she riveted every gaze, and when she was absent from it her audience thought of her and wished for her return. This peculiar power has not been manifested in this part by any other representative of it, and it is not possessed by Miss Marie Wainwright, who plays it now. The embodiment of Viola that is given by this pleasing actress commends itself to sympathy and admiration by physical beauty, by demure grace of demeanor, by a certain mock dignity and coy reserve, and by lingering sweetness of speech. Yet somehow the child-like simplicity of manner does not create a perfect illusion, although it is well assumed and well sustained. But altogether the practical result is that in Miss Marie Wainwright's revival of *Twelfth Night*, the humorous scenes—the scenes which implicate Sir Toby Belch, Sir Andrew Aguecheek, Maria, the Clown, and Malvolio—come into the front of the picture and remain there. Sir Toby Belch, formidable though festive, is made the very genius of rosy revel by Mr. William Owen, an actor whose personality and whose artistic faculty and resource convey a cheering intimation that the old-fashioned unctuousness of humor has not yet wholly vanished from the stage. Malvolio is depicted as equally a pitiable and a ludicrous type of self-love, and therefore is depicted right. Mr. Barton Hill makes him a man of austere character, scrupulous outward propriety, wedded to formal routine, and in dead earnest.

Unusual care has been taken in the embellishment of *Twelfth Night*, and Miss Wainwright will offer it to the public view in many cities throughout the United States. Mr. Mansfield's magnificent production of *Richard the Third* is also to be shown in other cities; and when Mr. Daly takes his dramatic company to Europe, as he intends to do next summer, it is probable that he will present *As You Like It* in London. These three simultaneous Shakespeare revivals in New York are manifestly such as justify a thoughtful consideration of their spirit and influence. Movements of this kind in the dramatic field contemplate the gratification of a high order of public taste and minister to the instruction as well as the recreation of the people. They ought to meet with encouragement, since in their progress the good time may arrive when the true function of the stage will be more widely appreciated than it is in this period, and when intelligent beings will be ashamed to say that they go to the theatre simply to be amused.



MARIE WAINWRIGHT AS VIOLA, AND FREDERIC ROSS AS THE DUKE.

SHOPPING IN LONDON.

BY JULIAN RALPH.

THE charm that ladies find in shopping exists for them in London quite as much as in Paris or in New York, but the conditions are almost wholly different. The shops of London are in the main the little stores that we had in New York before the war. There are a few large shopping stores, such as Whiteley's and the Army and Navy stores, the Civil Service Co-operative stores, and two or three other and smaller ones, but London has no such stores as New York either in extent or number or attractiveness. In fact, one comes back to New York with the certain conviction that it is the shoppers' paradise. The fascination for American ladies who shop in London lies in the bewildering displays in the shop windows. The rule that obtains in the great stores of New York is exactly reversed in the small shops of London. Here some large shopping stores display absolutely nothing to passers-by, and those large stores whose windows are dressed show only the latest novelties or most tempting bargains. But in London everything is heaped in the shop windows.

There is nothing in America to liken to a typical London shop window. It is heaped or hung or packed with the most extraordinary number and variety of objects. Some windows are fitted with hanging shelves that mount from the bottom to the top of the enclosure, and all are loaded with goods, while racks or lines of hooks at the sides of the window fill those spaces also. As a rule, the price is plainly marked on a ticket on each article. These remarkable exhibitions convey the idea that since there is such a variety exposed, the line of goods in the store must be absolutely complete and bewildering. The shopper soon learns better. Usually there is nothing on the shelves or in the show-cases of which a sample is not to be seen in the window. To illustrate this, suppose you wished to buy scissors, or a silver pencil, or a lady's "Albert"—as they call a lady's fob chain. You would go into the shop that displayed the greatest variety of the article you wanted. Ten to one, when you went in and asked to see what they had in that line, the clerk would reach into the window and take out the very board or box or string of things that attracted your attention in the street. He would have no others to show you.

But there are great shopping stores there, and it is the mission of this chapter to describe the greatest of them all, that of William Whiteley, "the Universal Provider." It is often called "the largest store in the world," and so it is in more than one way. Accurately speaking, it may not be unique in size, but it is absolutely unparalleled in the variety of enterprises that its proprietor conducts. They said to me in Whiteley's that we had at least one equally great shopping establishment in America; and whether it was due to their modesty or their ignorance, they left it to me to discover that neither in America nor anywhere else is there any commercial establishment that approaches that store in the multitude of businesses, often widely separated in character, that is carried on under its roofs.

Whiteley undertakes to care for British army officers in whatsoever part of the world they may be quartered, sending them furniture, bedding, table-ware, servants, clothing, or food if they want it. What he does for them he also does for any one else who orders it. It is part of his business to supply everything required for a ball, be it in England, Wales, Scotland, or Ireland. It is left to him to wax the floors, send the street awnings, music, servants, cooks, food, table-ware, crash, orders of dancing, carriages, hair-dressers—everything. He fits out picnic parties, hunting parties, dinner parties, sailing or fishing parties in the same way. If you wish to give a theatrical entertainment in any part of the three kingdoms, all the worry you need give yourself is that which is attendant upon ordering what you want and paying for it; all the rest Whiteley will do. He rents or sends out marionettes, magic lanterns, and Punch and Judy shows, and the men to operate them, concert troupes, vocalists, orchestras and bands, conjurers, ventriloquists, and negro minstrels, performing dogs, cats, monkeys, and mice, equilibrists, and lecturers. You may order a lecture by an Oxford graduate if you wish. That item is down in his list. He sells fireworks. He keeps for hire as well as sale such paraphernalia for all sorts of routs and festivities, as lanterns, trophies, platforms, marquees, tents, tables, chairs, awnings, and flags. I suspect that when living entertainers are ordered, Mr. Whiteley sends out and gets them, but it amounts to the same thing as if he boarded and lodged them in his store.

He fits out persons for voyages to and residence in Africa, South America, New Zealand, Australia, Canada, and the United States. For the latter country he puts up "revolvers, a revolver belt and pouches, a hunting knife, and a portable bath." Our little boys who read dime novels and run away to fight Indians afterward should order their outfits from Whiteley if possible.

Every one knows what Bath-chairs are, though we do not make use of them in America. They are exaggerated baby carriages that are pulled instead of being pushed, and in which aged persons, invalids, fops of both sexes, and lazy folks can be trundled about in city and in country. Whiteley keeps them for sale or for hire. He also provides men to pull them. He maintains a bank of deposit for his employés and the public. Five per cent. interest is paid to depositors, and seven days' notice is required for the withdrawal of an account. The bank is in the same section of his store as his office and counting-house, and here also he carries on the businesses of an intelligence office for the hiring out of servants, an agency for the renting of houses, an insurance office, a coal office, a money exchange, and an auction department. The lost property and general information bureaus of the great store are also here.

Whiteley will move your furniture for you, or he will rent you and your wife the clothing and dresses you may need to make yourself presentable at your rich uncle's house in the country, or at a ball, a wedding, a christening, or a funeral.

I asked if it was a fact that one could order a husband or a wife at Whiteley's, and was told that both had more than once been provided for eccentric customers.

"It will not seem so strange when you know how it is done," said the gentleman I addressed. "We get letters from women who want husbands, and from men who want wives. We put the couples into communication with one another, and marriages sometimes result, that is all."

Whiteley sells a great many of the parts that go to make up a house. For instance, he keeps on hand sills, doors, mantels, chimney-pieces, stained glass, hangings, all interior wood-work, baths, sinks, every appurtenance of plumbing, balusters, elevators, furnaces, iron fences, wood floors, complete stable fittings, wall-paper, lamps, gasaliers, and a thousand other requisites for a city or country house. He even advertises to build the garden walls of masonry, which, in England, are used as we use fences in our cities.

You may go confidently to Whiteley's to order your walls papered, to buy pictures, or to have them mounted or framed, to have the plumbing in your house or store attended to, to order dyeing or scouring, to get your dinner, or to have your photograph taken.

He keeps a railway and tourist office, and hair-dressing and barber shops for ladies and gentlemen, and there is direct and close communication between his store and the post and telegraph offices. He does all his own printing, and, by-the-way, his catalogue is a book of about 2600 pages of fine print and necessary illustrations. The only periodical publication in London that exceeds it in size is the London Directory.

Mr. Whiteley employs five thousand persons in the busiest season of the year, and three-quarters as many constantly. He finds that it pays to board and lodge the unmarried ones, and two thousand of his employés live upon his premises. These are lodged in thirty-six houses and a dormitory, the sexes being separated at night. All are prompted to provide recreation for themselves in such ways as are suggested by the fact that a so-called "institute" is maintained by them. There they hear music and lectures, and may read and study. They give an annual garden party and a concert or two every year, and thus make the institute self-supporting. They have organized cricket, rowing, cycling, tennis, and dramatic clubs. For their annual games it used to be necessary to rent grounds, but this year a field has been purchased for them, and they hold their yearly sports together. This is what they eat in one day:

Fresh meat	1300 lbs
Bacon and ham	100 "
Flour	1 sack
Bread	800 loaves
Butter	150 lbs
Eggs	300
Tea	60 lbs
Coffee	30 "
Leaf-sugar	100 "
Moist sugar	50 "
Cheese	30 "
Currants	20 lbs
Rice	30 "
Fish	80 "
Poultry	10 "
Ale	100 gallons
Porter	24 "
Milk	25 "
Potatoes	10 sacks
Greens	20 bushels
Parsnips	2 "

But despite all these respect-inspiring, almost incredible details, Whiteley's is a disappointing place to an American. This Colossus among shop-keepers has neither the American nor French genius and instinct for display. He belittles his business quite as much as some American store-keepers exaggerate the true extent of their operations. Our great shopping stores in New York are copied after the leading Paris stores, such as the Bon Marché and Au Printemps and the Louvre. These are vast businesses carried on in grand and sometimes palatial buildings constructed especially for them, and especially to impress the beholder. But "Whiteley, the Universal Provider," as he calls himself, has a mere aggregation of shops, that make it seem as if what Topsy says of herself in Mrs. Stowe's novel is just as true concerning his business, both have "just growed."

You go to Whiteley's from Charing Cross, the centre of London, by a long journey—as long as from Madison Square to Harlem. The great shopping bazar is in a district of London called Bayswater—a residence district like Harlem, and provided, as Harlem is, with a distinct business and shopping centre of its own. The best way to go is on top of a 'bus, for your route takes you through the busiest and most fashionable shopping streets, so that you see nearly all the world-famous stores before you come to Bayswater. But for a visitor to London the same advice always holds good. No matter where you want to go, or of which sex you are, take the top of a 'bus, unless you are in a hurry.

The first appurtenance of Whiteley's that you see is a flag waving from a mast 150 feet high above his Queen's Road buildings. In another instant you discover that the block of shops before you on the street you are riding in (Westbourne Grove it is called) all bear the name Whiteley over their doors on golden signs. Each shop displays in its window the sort of goods sold within. Each shop, or store, as we would say, has a separate doorway on the street, but a passageway running through them all midway between the front and back walls connects them. These stores have counters on either side, with the goods in show-cases and on shelves along the walls. Nearly all have tables between the counters, and nearly all are far too small for the business transacted in them. The ceilings are very low, and usually valuable space is taken up by stairways leading to other stores on the second story. These upper and lower floors are, in the main, utilized systematically. If the lower ground-floor shop contains men's clothing, the one above is certain to contain boys' clothing. If the lower room is the millinery store, the upper one will be the milliners' work-room, and so on. These separate shops result in one great gain to the public—customers are served expeditiously. The clerk who sells you anything at once wraps it up, and as there is a cashier tucked away in a little closet in each shop, money is quickly changed, and sent to and fro either by cash messengers or the clerks. But the system is not to the advantage of the proprietor, for no one is impressed by what he or she sees of the business; no one can take it all in at a glance either outside or within, as is the case with similar stores in Paris, New York, Philadelphia, Boston, and Chicago. Then, again, in Whiteley's there is too much crowding, too great use of artificial light, and too pressing a need for better ventilation.

Some of the shops are not to be included in this criticism, however, for they are superb. You come upon them, in a tour of the premises, with astonishment and delight. Such is the candy store, and the store for the sale of cut flowers, plants, and floral designs is a fine one. The latter contains an aquarium and fountain where are kept for sale water-plants, frogs, goldfish, and the like. Close by is the zoological store, filled with dogs, rabbits, cats, parrots, pigeons, squirrels, and I don't know what else. Here you may order an elephant or a tiger with a certainty of getting either, and promptly. The grocery store is a very large, light, and sweet-odored department. The pretty girls in white caps and aprons behind the counters are especially selected on account of their beauty as well as ability. The goods in the grocery are displayed as if the room were a show-place instead of a store. Near at hand is the butcher's, pork butcher's, and fish dealer's department, and this also is as fine as any store of the sort in America. Marble is conspicuous in its appointments. Here are sold fresh meats, fish, sausages, pork, cold cooked meats, potted meats, vegetables, cheese, and bacon. The display in the furniture shop is worth going far to see. One of the rooms in which furniture is shown measures 300 feet long by 45 feet wide. Whiteley's includes a wine and liquor department, and several factories also.

Whiteley's contains 67 of these departments. It has 15 acres of flooring, exclusive of the dormitories, reading, and recreation rooms, and Institute, which occupy another 5½ acres. The stables and wagon sheds take up another 9½ acres. The proprietor has a farm of 300 acres at Finchley, near London, so that his business requires 330 acres in all. He has taken nearly an entire little street to house his female help apart from the men and boys, who are lodged on his Queen's Road property. It is over the stores on that street that he flaunts his flag from the towering staff that all London knows as well as we New-Yorkers know the shot-tower near the City Hall. The employés' restaurants, packing and shipping departments, boilers and engines, mailing departments, and the great rooms where orders by mail are filled and requests for samples are answered are all in the basements under the stores. The mailing department is a grand institution in itself. Between 4000 and 5000 letters come to it by the first post every day, and the number that come by subsequent posts averages 1500 a day.

The founder and proprietor of this amazing aggregation of industries is a Yorkshire man of fifty-eight years of age, who established himself in Westbourne Grove twenty-six years ago in a little shop, with two clerks and a boy to assist him. As it is always deemed necessary to mention the sum of money with which such a man arrived in the city where he subsequently makes a fortune, the fact in this case should be stated. It is that Mr. Whiteley had forty dollars. He is a short, stocky man, with long reddish side whiskers of the Dundreary pattern, and with a marked absence of neck and generosity of girth. His prominent sharp nose and piercing dark eyes force his face upon the memory. It is said of Mr. Whiteley that he has never received a loan or favor or financial help of any sort, and that even when money has been bequeathed to him he has refused to take it. If his biographers tell the truth he has nothing, and will take nothing that has not accrued from his business.

I noticed that while our party was making a tour of the great aggregation of shops a fair young American member of it once nudged her father as she was passing the display of ready-made linen garments. "I don't understand how the English women can stand it," I heard her say. "All the material that I see made up in the shops is coarse enough to shoot peas through." When our guide heard her complaining that the kid gloves she had purchased in another shop were two sizes too large for her, the man said he thought the reason was that the numbers by which glove sizes are designated had recently been changed, so that all have lower numbers than they used to. "Our English ladies have large hands," he said, "and I suspect the change was made to flatter them." In the shop where ladies' dresses are displayed, there is said to be a variety that embraces everything between a calico wrapper and a gown costing 150 guineas. "What a pity!" the American miss remarked, *sotto voce*. "Just to think that not one garment in the whole lot will fit whoever buys it, and that not one purchaser will ever care whether it does or not, and that nobody would know how to fit a dress if such a thing were demanded."

"Good heavens!" her father exclaimed; "what ever will become of a nation so lost to all that makes up human greatness?"

The young lady plied our guide with questions, and I thought I saw by the queries she put that she was making a desperate effort to judge the great place fairly, but that every reply to every question was settling her deeper and deeper in the conviction that there was little in it to admire. Finally she put one momentous interrogation, on the answer to which it seemed to me her irrevocable decision was to turn for or against the place.

"Where are your bargain counters?" she asked.

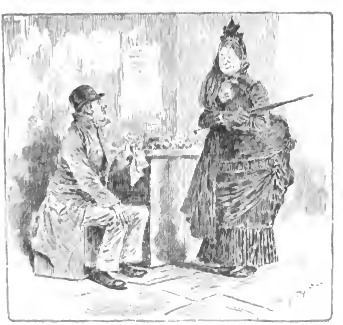
"Bargain counters, miss?" the man repeated. "What are they?"

She explained.

"We have none," said the man. "We have instead what we call 'remnant day.' One day in each week we display what you would call bargains, and the people are aware of it, and rush to see them."

I could see deep into the fair American's mind, and it seemed to me that my mind's ear heard her thought, "If I was doomed to live in London, remnant days would be the only ones on which I would ever come to this place."

Other very great stores in London are the co-operative stores of the army and navy and of the civil service. They are so like the great shopping bazars of this country and Paris that they need not be described here. Their purpose is to sell goods at the lowest market prices to stockholders and members of the branches of the public service after which they are named. The profits are divided among the stockholders, who are greatly envied by the rest of mankind. So firm is the public confidence in the quality and cheapness of all goods sold in these stores that a majority of the members find it impossible to avoid sharing their privileges with their friends. To buy in such a store it is only necessary to use a member's number, and that is merely mentioned to the clerk who waits upon you. The first thing the average American acquainted in London is apt to do is to borrow some one's number, so as to shop in these stores, and it is surprising how easy a thing to do that is.



WEEDS.

"Ye have me sympathy, Mrs. Sullivin."

"Phwat for, Mr. O'Brien?"

"Your beravement. It's in mournin' costume ye air I see."

"Sure an' it's in afthernoon' costoom oim in. It's me night out. Me missus was afther discardin' her wades, an' it wasn't the loikes o' me to refuse sich a garmint, considerin' the missus succeeded in obtainin' a new husbin' a-wearin' of 'em."

RECENT DISCOVERIES IN THE CONGO BASIN.

THE GEOGRAPHICAL SURPRISES AND NEW-FOUND PEOPLES OF THE PAST FIVE YEARS.

BY C. C. ADAMS.

I.

IN the light of our present knowledge of the Congo, the wild speculations and beliefs of earlier decades in this century appear almost grotesque. When Tuckey led his ill-fated party up the cataracts in 1816, geographers told him that if he found the river coming from the northeast, as, in fact, it does, it would strengthen the theory that the Congo was the lower course of the Niger. The best maps fifty years ago depicted the fountains of the Congo among the Mountains of the Moon; and when those elusive summits were sponged from the charts, the shrewdest guesses of the map-makers failed to hit the mark. Livingstone died in the belief that the sources of the great river he traced with such courage and patience in his last feeble days were the fountain-head of the Nile; and some geographers assigned all the great lakes from Bangweolo north to the Nile Basin.

Stanley opened the gateway to the Congo Valley, and introduced an era of geographical sensations and surprises unequalled since the discovery of America; and we can imagine how stupendous was the task before the little band of explorers, when it is said that after Stanley's five years of magnificent effort in the great valley we did not have before us even the skeleton of the geography of this river basin. He had been compelled to give most of his wonderful energy to gaining a foothold, to winning the friendship of hundreds of chiefs, and to planting his stations along 1300 miles of the main river. When his last book was published, four years ago, we hardly knew of the existence of the Mobangi, the longest Congo tributary. We had no idea of the real importance and extent of any other great tributary, nor at what point the largest of them joined the Congo. We knew nothing of the remarkable Batwa dwarfs, who hide away in the dense forests south of the Congo, and we had no idea that in this basin would be found the greatest hot-bed of cannibalism of which the world ever heard.

II.

Then began a series of revelations which astonished the geographers and anthropologists. From the exploration of the Mobangi in 1884 to the mapping of the Aruwimi and Lomami a few weeks ago every mail from the Congo has brought new facts for the maps, and every year has furnished its remarkable surprises. A few brave and hardy explorers have completely upset our earlier notions of Congo hydrography. The river which eleven years ago was not classed among the great rivers we now know is second only to the Amazon in the volume it pours into the sea. Its resistless outflow is not for a moment interrupted by the Atlantic tides, and though they invade it as an undercurrent, at its very mouth fresh water can always be dipped from its yellow surface.

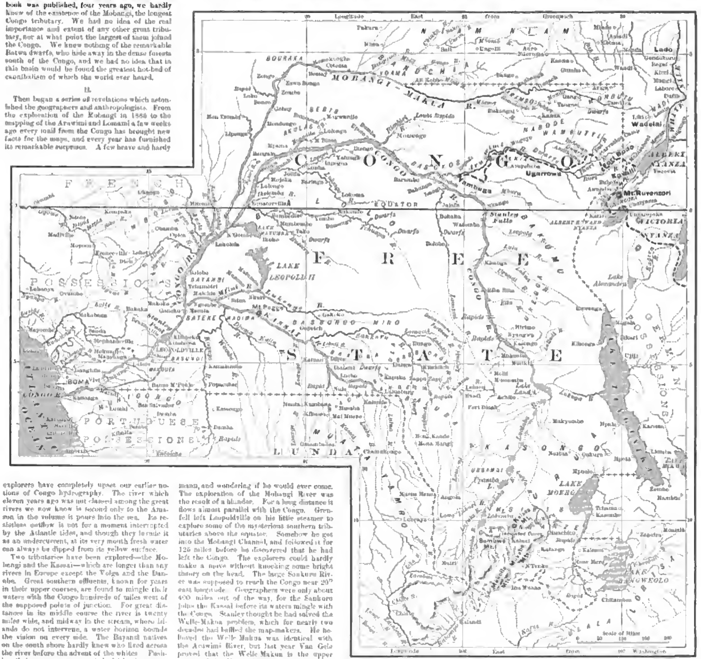
Two tributaries have been explored—the Mobangi and the Kassai—which are longer than any rivers in Europe except the Volga and the Danube. Great southern effluents, known for years in their upper courses, are found to mingle their waters with the Congo hundreds of miles west of the supposed points of junction. For great distances in its middle course the river is twenty miles wide, and midway in the stream, where islands do not intervene, a water horizon bounds the vision on every side. The Bayansi natives on the south shore hardly knew who lived across the river before the advent of the whites. Pushing their way among a myriad of islands, steamers pass without being aware of each other's proximity. The Emin Relief Expedition, with its fleet of steamers, went up the river unobserved by white men on the banks. Stanley was accused of exaggeration when, four years ago, he estimated that there were about 6000 miles of navigable waters above Stanley Pool. We now know that light-draught steamers at Leopoldville have before them unimpeded waterways aggregating over 7000 miles of navigation. No matter if five cataracts at Stanley Falls bar the way to the heart of Africa. Two independent routes have been discovered, one of them almost completely subtending the great northern bend of the Congo, and steamers from Leopoldville have reached points nearly midway between the two oceans.

For five years a half-dozen men, still little known to the world, have been threading the mazes of the Congo water system. All but two of them have been far too busy to record their great work in books. Their absorbing story must be dug out of reports to the government of the Congo Free State or to geographical societies. But the fragmentary records of these men are full of incidents instructive, amusing, and remarkable. When Wissmann launched his canoes on the Lulua affluent of the Kassai, and traced the greatest southern tributary to the Congo, his wonder daily grew as the river bore him westward, ever westward of its supposed course, and for weeks after he had reached the Congo a steamer was tied to the bank 250 miles further up the river, with mails and supplies for Wissmann, and wondering if he would ever come. The exploration of the Mobangi River was the result of a blunder. For a long distance it flows almost parallel with the Congo. Grenfell left Leopoldville on his little steamer to explore some of the mysterious southern tributaries above the equator. Somehow he got into the Mobangi Channel, and followed it for 125 miles before he discovered that he had left the Congo. The explorers could hardly make a move without knocking some bright theory on the head. The large Sankuru River was supposed to reach the Congo near 20° east longitude. Geographers were only about 400 miles out of the way, for the Sankuru joins the Kassai before its waters mingle with the Congo. Stanley thought he had solved the Welle-Makua problem, which for nearly two decades had baffled the map-makers. He believed the Welle Makua was identical with the Aruwimi River, but last year Van Gele proved that the Welle Makua is the upper course of the Mobangi, and reaches the Congo over 500 miles from the place Stanley indicated. Junker believed the Nepoko was the Aruwimi, but it turns out to be merely a tributary of that stream. As late as September, 1888, Stanley thought the Muta Nzige was probably a Congo feeder, but he has now shown it to be one of the fountains of the Nile. Since the map which accompanies this article was completed it has been once revised to include fresh discoveries. The latest Congo map of *Le Mouvement Géographique* was revised five times after it was ready for the press before the public saw it.

III.

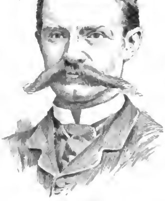
So the additions to geographical information have been an unbroken series of surprises; and the remarkable facts concerning millions of people who are now first revealed to the world are even more interesting and unexpected. The explorers have had a great variety of experience, from amusing to tragical, with these boisterous and sometimes dangerous children of nature. Some of them thought the strange visitors were ghosts, and others that they were cannibals who had come among them simply because black men were plentiful there and good to eat. Tinned meats were looked upon as reserve supplies of human flesh. Good management, tact, a little harmless deceit, or spectacular display has usually sufficed to transform enemies into friends. Wissmann was compelled to fight his way through the country of the Bassongo-Mino cannibals while floating down the Kassai. The fierce Yakama of the Mobangi Makua surrounded Van Gele on an island, and would have utterly destroyed the party had not his guns cleared a way through their myriad of canoes. These deplorable events are the most notable occasions on which blood has been shed during the later era of Congo exploration, until Stanley had to fight his way among the denizens of the great Aruwimi forests. It is the policy of the Congo State to punish all natives who molest white travellers. The Bassongo-Mino cannibals and the natives of the Upper Congo, who have attacked the whites simply because they confounded them with the murderous Arabs, have been taught discretion by the burning of their villages.

Jacques De Brazza worked his way for hundreds of miles through the northern Congo forests with his compass playing the part of a powerful fetich worth going far to see, but terrible in its resentment of evil done the whites. His more famous brother Savorgnan opened the route up the Ogowe River through the formidable Pahouin tribe, who had turned Du Chaillu and all other white men back, by filling the sky one night with an amazing display of rockets, Roman-candles, and whirligigs. Wissmann also found fireworks effective when a chief told him that the passage of a certain river would be the signal for war. The shrieks of a steamer whistle has sent many a hostile little fleet scurrying for shelter. When Dr. Wolf discovered the new route to Central Africa up the Sankuru, a plot to kill the



THE CONGO BASIN FROM THE LAKES TO THE ATLANTIC.

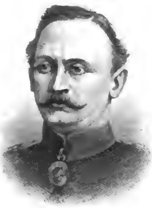
party was hatched by Bassongo-Mino natives, who openly discussed it, not knowing that one of Wolf's men could understand them. "See!" cried the chief, "they have no spears or arrows. We will kill them all, and take their beautiful things." Wolf walked up to the chief, fired a revolver close to his ear, and the savage dropped to the ground with fright, and then begged the white man to go on his way in peace. Grenfell tried blank-cartridges on the Tchuapa River until they ceased to be a virtue. "You shoot with smoke," shouted the hostiles, "and smoke never hurt us yet." A few whizzing bullets, which splashed water over their canoes, gave them other views, and they retired to a respectful distance. Grenfell has never shed a drop of blood in all his long journeys on the steamer *Peace*. When he could not advance without killing the natives, he retired. One day he turned his prow toward a crowd of howling natives who were poising their spears on the shore. He came near enough to throw among them a cloth full of beads, brass wire, and gewgaws, and then withdrew. On another occasion, when his vessel grounded on a sand bar, and a fleet of menacing savages bore down upon him, his wife, with a woman's ready wit, threw among them a double handful of beads, and in their scramble for the treasures the savages forgot to attack until the boat was again in the channel. Grenfell's prudence and humanity paved the way for friendly relations with many a tribe who had received him with threats of destruction. The reputation of being a great wizard has been a convenient resource for many an African traveller. When the Bangala refused to sell food to Coquilhat, and he was in a sad plight, he told them, as they met for a palaver, that unless they became friendly and helpful, he would summon his brothers to his aid. It happened just then, though Coquilhat did not know it, that a steamer was approaching the town, and the natives, looking down the river where his finger pointed, saw the puffing little vessel. For a while after that there was nothing too good for a man who could summon steam-boats by a wave of his hand.



DR. L. WOLF.

IV.

These explorers have found that probably one-third of the people of the Congo Basin, which is supposed to contain about 20,000,000 souls, are cannibals. For 1300 miles up the great river, from Bolobo, above Stanley Pool, to a considerable distance above Nyangwe, nearly all the tribes are cannibals. Some of the largest Congo tributaries, like the Mobangi and the Aruwimi on the north, and the Tchuapa and Lulongo on the south, are thickly peopled with them. They are the dominating tribes in more than one-half of the Congo State, and some very curious discoveries have been made about them. As a rule, they do not eat women. Though some tribes, like the Manyema, say the flesh of a man is much more savory than that of a woman, it is believed the chief reason the fair sex usually escape the cooking pot is because their commercial value is greater, and comparatively few of them are killed in war. Cannibal tribes are often superior in physique, intelligence, and in their arts to the natives who abhor their practices. The largest building yet found in equatorial Africa, the assembly hall of the Monbuttu cannibals, is over fifty feet high and 150 feet long, and its immense roof is supported by five rows of posts made of trunks of trees. The Monbuttu are the most famous cannibals of the Congo Basin. When Schweinfurth visited them they followed the tribes around them simply as game, killed as many of the enemy as they could, smoked the flesh, and bore it away as provisions. Among the curious sights of the Congo Basin are the suspension-bridges, a net-work of stout vines thrown across the streams. They are usually the private property of a chief, who collects toll of the passengers. The finest specimens of these bridges are said to be those made by the Manyema cannibals in the Upper Congo Basin. They are so skilfully made and firmly anchored that they hardly move under the tread of marching people. The best native servants of the Congo State are the Bangala cannibals, who thickly populate the banks of the Congo above the Mobangi. Five thousand of these cannibals, many of whom manned the canoes which gave fearful battle to Stanley, and chased him down the river, crying, "Meat! meat!" are now enrolled among the State militia, and are trained to service as soldiers, boatmen, and station laborers. One of our illustrations shows a squad of cannibals from near the Aruwimi River, in the State uniform, learning the manual of arms at Boma, over 1000 miles from the great plateau where they have hunted men for food.



CAPTAIN WISSMANN.

Tribes that do not indulge in this atrocious practice have the greatest horror of cannibals. Coquilhat's men at Bangala could not repress their disgust when they saw scores of natives walking about nibbling pieces of human flesh, which they held in banana leaves. Von François describes the terror of his fat servant when they reached the cannibal tribes of the Tchuapa River. Nothing could induce him to leave the boat, and he was wisely precautious, for the natives regarded him with greedy eyes, and more than once begged the whites to make them a present of the man as a token of friendship. Knowing the whites abhor the practice, the natives often deny at first that they eat human flesh, but when they can no longer conceal the fact of their indulgence they boldly justify it. The Manyema told one explorer that their neighbors were thieves and ought to be eaten. "They come here," they said, "and steal our bananas, and so we chase and kill and eat them." A small tribe near the Kassai told Kund and Tappenbeck that they were not friends of theirs, for when their friends came to see them, they always brought them a few men to eat. The Bangala were rather bright in some of the answers they made to Coquilhat's words of protest.

"This is horrible," he said to a chief, whom he caught at dinner.

"On the contrary, it is delicious with salt," was the reply.

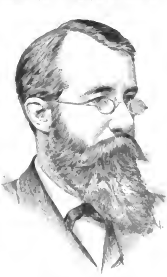
"This is a bad use to put a man to," Coquilhat remarked to another.

"All your talk about man being such a great being," the chief answered, "shows that human flesh is the best sort of food. It is a noble aliment, while the flesh of mere animals is a vile sort of nourishment."

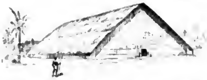
The more intelligent cannibals admit that when they eat men they destroy a source of wealth, but they say they cannot renounce a great pleasure to secure a doubtful gain.

A distinction must be made between those cannibals who only occasionally taste human flesh and those with whom it is an habitual food resource. The Bangala, for instance, believe that the bravery and other qualities of a victim are imparted to those who partake of his flesh.

A white man who long lived among them says he saw only three cannibal feasts in five months. There are many tribes, however, like those along the Aruwimi, with whom human flesh is an article of daily diet if they can get it. It was among these people at the mouth of the Aruwimi that a Houssa soldier in the service of the State had a thrilling experience. He and two others were left at the site of a station the State intended to establish. The natives took his two comrades out in canoes on a pretence of fishing, and from the bushes where he had concealed himself he saw their dead bodies brought back, and all the preparations of the cannibal feast. He was captured and destined to the same fate, but before the preparations were made he managed to escape. For weeks he lived in the woods, subsisting upon roots and a little raw manioc he stole at night from the gardens. He was finally caught again, but being too emaciated for service, he lived on the fat of the land while acquiring the requisite plumpness. He was finally rescued by Arabs, just as he was about to be sacrificed.



THE REV. G. GRENFELL.



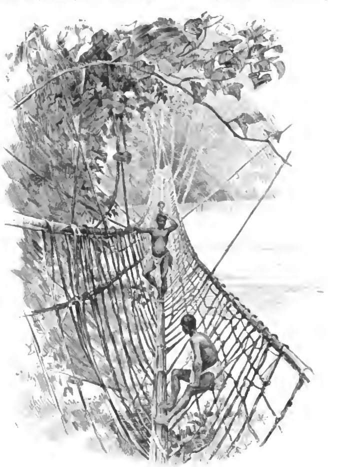
LARGEST NATIVE HOUSE IN CENTRAL AFRICA

Captain Van Gele has told of the densely peopled portion of the Lower Mobangi, where tribes make war for the single purpose of procuring meat. He saw a war expedition of the Banzi which numbered fifty canoes. At the mouth of the Aruwimi River a station has just been established whose garrison includes several hundred Basoko cannibals. It is believed that by decreasing the opportunities for indulging in this practice the men-eaters who are in the service of the State will be gradually weaned from it. The State fully intends to exert its influence as far as possible to prevent cannibalism. It is an encouraging fact that one tribe is known, the Balube, who voluntarily abandoned anthropophagy, and now regard the practice with disgust. Though it will undoubtedly be a very slow process, there is reason to believe that as the influence of white men extends, cannibalism in the Congo Basin will gradually disappear, as it has from many Pacific islands.

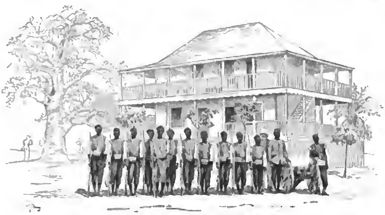
V.

When Stanley traced the Congo to its mouth, he heard at Nyangwe of fierce dwarfs, who were said to live in great forests to the north, and to be most intractable little creatures, fighting like demons with poisoned spears and arrows, eating the bodies of their fallen foes, having no settled abode, but wandering from place to place through the forests. It was thought these stories were greatly exaggerated by Arabs, who wished an excuse for declining to send an escort with Stanley on his way down the river. It was not until 1885 and 1886 that four of our explorers discovered the Batwa dwarfs spread over a great area in that part of the Congo Basin which is directly south of the great northern bend of the river. In one season Grenfell and Von François found them in large numbers in two different river basins over 200 miles apart. Grenfell had previously found them on the Upper Lomami, southwest of Stanley Falls. Between the Lomami and the Congo the Arabs say they have had many a hard fight with them. Further west, on the Bussera and Tchuapa rivers, Grenfell and Von François had a number of unpleasant encounters with them. At the furthest points reached on both these rivers the hostility of the howling little folks prevented further advance. Their arrows, slimy with poison, were showered by hundreds upon the wooden sun roof of the steamer, or dashed against the steel net-work that protected the deck. Looking up the precipitous bluffs above the Tchuapa, the explorers could see the little coffee-brown people clambering where it seemed impossible to maintain a foothold, and they saw them, too, swinging with the agility of monkeys from limb to limb of great trees, creeping far out on branches overhanging the river, and launching their shafts in mid-air at the impertinent strangers who had dared to invade their privacy. Over 275 miles further south Wissmann met them in the country of the Bassonge, and he described the specimens he met as ill-shapen, woebegone bits of humanity, despised by their neighbors, and living in tiny huts. Far west, near the Kassai River, among the Bakuba, Dr. Wolf met them also. They seemed to be timid little souls, quite unlike their fierce brethren who had given such a warm reception to Grenfell and Von François.

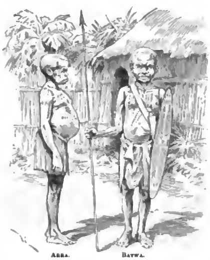
These curious people, as revealed to us by our four explorers, inhabit a region a little larger than the State of Maine. They are lighter in color and not so prognathous as the Akka whom Schweinfurth discovered on the upper waters of the Mubangi-Makua, and of whose fighting qualities Stanley has recently had the most unpleasant experiences. Both the Akka and the Batwa are cannibals. It was an Akka dwarf who told Emin Pasha, when quitting his service, that he was going home because he was tired of beef. The Akka, from four feet to four feet six inches in height, are believed to be the smallest people in the world. The Batwa are a little taller, and, according to the several authorities, they seem to average about four feet six inches in height. In only a few places do they form the exclusive population. They wander around among other peoples whose language they speak, and whom they supply with the products of the chase, for there are no hunters in the great Congo forests like these active little fellows. Eight or more families of them rear their rude huts together on some good hunting-grounds, and when in a few months game becomes scarce, they move on to other fields, and again dig their pits for elephants, buffalo, and hippopotami, which are impaled on sharpened stakes as they break through into the trap. From the boughs of trees also they hurl their spears at creatures going to drink, and, if need be, they follow the wounded animal for days, planting a fresh spear in its flesh whenever op-



A SUSPENSION-BRIDGE.



TURNING CANNIBALS INTO SOLDIERS.



TYPES OF DWARF TRIBES.

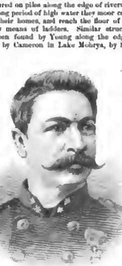
portunity offers. The cunning little fellows seldom lose a weapon. The barbed spear-heads cannot drop from the wound they make. The shaft is only loosely fastened to the joint, and as the animal brushes through the timber it falls to his side, where it dangles from a stout cord attached to the iron spear point. In war they use poisoned arrows, and, unlike most African tribes, they attack their enemy in the night, creeping noiselessly up to set fire to the huts, and then shoot the helpless victims as they rush out. Tribes who have not met them and won their friendship are in deadly fear of the dwarfs. "Don't go near the dwarfs," said the Congo people to Grenfell. "They permit no stranger to enter their country, they shoot with poisoned arrows, and they are the ugliest of mortals, with big heads and bearded chins upon the smallest of bodies." Sure enough, the explorers found that many of them wear thin beards, but they are not particularly ugly, and have no other marked physical peculiarity except their extreme smallness.

When the dwarfs are on the march to new camps they sleep at night on the branches of trees out of the reach of wild beasts. Their surplus meat they take to the nearest chief, exchanging it for vegetables or for brass wire and beads, with which they buy women for wives; and thus they are assimilating with the people among whom they wander, and many of their offspring are larger than their fathers. Anthropologists are speculating upon the origin of these curious people, who were known to the ancient Greeks, and whom Herodotus and Aristotle described. All the linguistic and other evidence that seems worthy of consideration favors the theory that these scattered dwarf families—the Akka north, and the Batwa south of the Congo, the Doko of Abyssinia, the Obongo of the Gaboon, and the Bushmen of South Africa—are the remnants of the aborigines of inner Africa, who were finally scattered far and wide by the incoming of other peoples.

VI.

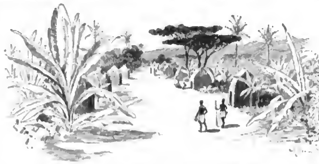
The dwarfs are only one phase of the remarkable discoveries made in this great forest region which fills the entire country south of the big northern bend. No one dreamed three years ago that scattered all through this great district live a people known as the Balolo, believed to number several millions, the most numerous and widely disseminated of all the Congo races—a copper-colored people of superior physique and of higher intelligence than most central African tribes, living in organized communities, and hospitably disposed toward the whites as soon as they learn their friendly purposes. A few weeks ago a little steam-boat had its trial trip on the Thames that is destined for the rivers flowing through the Balolo country, and eight missionaries are on the way to plant their stations on these river-banks.

Hundreds of thousands of the Balolo live in huts reared on piles along the edge of rivers, and in the long period of high water they moor canoes under their homes, and reach the floor of their huts by means of ladders. Similar structures have been found by Young along the edge of Nyassa, by Cameron in Lake Mohrya, by Serpa Pinto and Arnot among the Zambezi head waters, and thus millions of people are reproducing in Africa the type of dwelling common in some parts of Europe during the era of the lake dwellers.



CAPTAIN VAN GELE.

We know little yet of this almost impenetrable forest region, except along the water-courses, as only Kund and Tappenbeck have plunged a little way into its depths; but we know it teems with human life, and the discoveries of Lieutenant Kund and his comrade promise rich rewards for future explorers. While scrambling through the virgin forest north of the Sankuru River, they came one day to a great clearing, where they marched through one of the longest street villages yet found in Africa; well-built huts with gable roofs thickly lined both sides of a street about nine miles long. The street was very neatly kept, all rubbish being removed every morning to pits dug for that purpose. Though these natives had never seen white men before, and did not possess a single article of European manufacture, they were very hospitable. They are among the few African tribes who sleep on beds raised from the ground. Living both by the chase and agriculture, their manioc and banana fields stretching far away behind their dwellings, they impressed the explorers as a happy people, shielded from outside dangers by the vast arboreal wilderness around them, and getting through life very comfortably without the blessings and the evils of civilization.



WISSMANN'S STREET VILLAGE TEN MILES LONG.

On the great savannas just south of this forest belt, Wissmann saw similar street towns, one of them a Beneki village about ten miles long, and containing, he estimated, 20,000 people. At night 5000 of the people visited his camp. When he crossed Africa the second time, he saw the pitiful ruins of this same town, with nothing to indicate that it had once been the peaceful home of thousands, save heaps of ashes, bones bleaching in the grass-grown street, and now and then a human hand nailed to a pole. This picture of desolation marked the eastern limit of the ravages of Arab murderers, the terrible scourge that has made Africa the scene of indescribable misery. Northeast of this place, in the Sankuru Basin, Dr. Wolf saw natives, who had never seen white men, armed with percussion guns, which they handled with skill. Arabs had supplied the guns, and taught their wretched allies how to use them on the slave hunt. It was one of the strange contrasts often met in Africa that not far from these blacks with fine guns in their hands, Wolf saw, on the banks of the Lomami, a most primitive people, housed during high water in rude huts built upon the branches of trees. These tree houses have also been discovered by Grenfell and Van Gele for hundreds of miles up the Mobangi, where they are used as posts of observation or places of retreat in time of attack.

VII.

Out of these forest depths have come some of the greatest geographical surprises. Wolf steamed up the broad Sankuru amid many tribulations, daily plastering his broken engine with clay, and using gun-barrels for steam pipes; but the news he brought home was worth all it cost, for he had found a splendid waterway from Leopoldville—800 miles—to within 130 miles of famous Nyangwe on the Upper Congo. He had solved the great problem of reaching central Africa by a route other than the Congo, blocked as it is by cataracts at Stanley Falls. On this great river, three miles wide at times, with an average depth of nine feet, he met hundreds of enormous canoes, twice as long as his little vessel, manned by eighty boatmen. It was a picturesque sight to see these great boats, with crews on their feet, plying the paddles so effectively that they far outstripped the little steamer. It was here Wolf found that woman is not always down-trodden in Africa. A powerful chief had bade him begone or he would kill him. As Wolf approached the shore, warriors lined it, poising their spears, when suddenly the chief's daughter rushed to the water's edge, commanded the sullen crowd to drop their weapons, and invited the white man ashore, willing, no doubt, to play the rôle of Pocahontas if occasion required. She requited him for the gewgaws he gave her with a boat-load of provisions, and sent him on his way with a cordial invitation to call again.

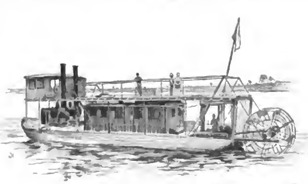
VIII.

Consulting our small scale maps, it is difficult to realize the vast extent of the rivers and territory of the Congo Basin. Look, for instance, at the Lulongo affluent, which meets the Congo a little north of the equator. It is a fourth-rate tributary, and yet, including its branch the Lopori, it is navigable for a distance as great as that between New York city and Detroit. It was only last year that Delcommune discovered the great importance of the Lomami, which he ascended for 585 miles, and which we have every reason to believe is a splendid highway for steamers for at least 800 miles, Cameron and Wissmann having found it broad and deep far south of Delcommune's farthest. In length the Lomami is a third-rate Congo tributary, and yet with its aid steamers have already travelled from Leopoldville to within sixty miles of Nyangwe—a distance greater than that between New York city and Omaha. Delcommune's discovery added another splendid route to central Africa, and when the railroad in the cataract region is completed, as it will be in about four years, there will be a steam route from the sea almost to the borders of Katanga in Msiri's kingdom, whose copper is even now exported to the coasts, and from whence several handfuls of gold nuggets have been brought to Tippu Tib, the natives as yet attaching no value to the metal, and throwing it into rubbish heaps. Katanga is in the heart of Garenganze, the only really powerful native kingdom in the Congo State. It occupies the southeast part of the State's territory, and the half-dozen white men who have been there believe it is the most promising region of inner Africa, because its resources are ample, and, owing to its elevation, white men can live there. It is the only part of the Congo State in which water freezes. No one ever dreamed before Delcommune's journey last year that a water route would be found to the border of Msiri's great country.

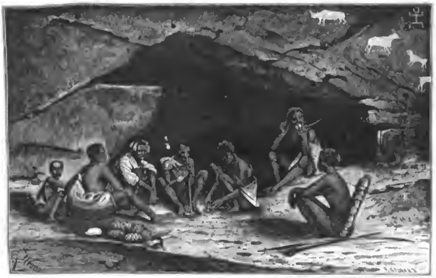
IX.

One of the most remarkable things in central Africa is the inhabited caves in the Sombwe Mountains, Garenganze, where thousands of natives live in a subterranean city. Twenty-six years ago a native of the Upper Nile told Colonel Grant that in Katanga he had seen inhabited tunnels dug through the mountains, and the roof of one cave was so high that from a camel's back he could not touch it with a spear. No one believed the story, but we learned last year that there was some truth in it. Mr. Arnot, the young missionary who tramped 2300 miles in Africa with very meagre resources, says the Sombwe Mountains are dotted here and there with these cavern mouths, and he believes they have an aggregate length of several miles. They are artificial excavations, many of them running parallel with the base of the mountains, with outlets here and there, in front of which are the fields of the cave dwellers. They house their herds and store their grain in the caves, into which they also retreat when an enemy approaches, finding safety in these labyrinthine alleys, for many of the caves are connected by dark passages. Though they are exceedingly timid, Msiri, with all his power, has never been able to extort tribute from them, for his soldiers have not ventured to follow them into their dark retreat. Arnot was not with them long enough to make a thorough study of this numerous people and their remarkable dwellings, but he will make a special report upon them when he again reaches the distant mission field to which he is now returning from England. Though these are supposed to be the most extensive cave dwellings in Africa, other tribes also perpetuate this the earliest type of human habitations. He is a happy Bushman who finds a cave prepared by nature's architect for the uses of his family; and at Elgon, northeast of Victoria Nyanza, a large number of people live with their herds in great artificial caves of whose origin they have no tradition.

If the Berlin Conference had known as much of the Congo Basin as we do to-day, the Free State would not have had its present erratic and illogical southern boundary. It was deemed wise to avoid all complications with the famous Muata Yamvo, whose country, larger than Germany, is in the southwest part of the great basin. In utter ignorance of the fact that the Muata Yamvo's power was falling to pieces, that his tributary chiefs were throwing off the yoke, and enemies were enslaving his people, the Conference excluded from the State's domain these great savannas, including nearly all the waters of the upper Kassai system. Portugal discovered the real condition of affairs, and made haste to declare a protectorate over the Muata Yamvo's country, and the Berlin Conference, although very anxious not to include any powerful king within the limits of the State, managed to embrace the country of Msiri, the most powerful prince in central Africa, who, when the Conference was appropriating his lands on paper, was unknown to the world. Garenganze is a country of grain fields, where, strange to say, the men themselves till the soil, and admit that they dare not face their wives unless they carry home after their day's toil a bundle of wood to feed the fire.



"THE STANLEY" ON THE UPPER CONGO.



CAVE DWELLERS.

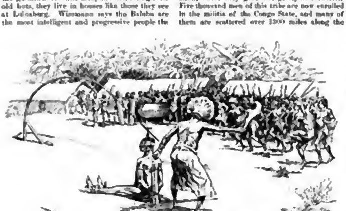
X.

Captain Wissmann would have been greatly commended if he had done nothing more than call attention to Calemba and his people—the Baluba—the remarkable chief of the most progressive tribe yet met in the Congo Basin. The Baluba occupy several hundred square miles on both sides of the Lulua affluent of the Kassai, and Luluaburg, the most southern station of the Free State, is near Calemba's capital. It is not often that explorers feel justified in calling the native rulers of Africa "intelligent and noble-minded" and "magnificent men." But we do not wonder that they sound Calemba's praises when we hear what he has done for his people. Calemba is a prohibitionist, and before he had even heard of the whites he abolished drunkenness by cutting down the palm-trees from whose sap wine was made. He told his people that their fetiches were powerless to help them, and ordered them burned; but though he abolished fetich worship, it is the one blemish upon his record that he introduced the more baleful practice of hemp smoking as a religious ceremony. Eighteen years ago his people studiously kept aloof from all their neighbors, and Calemba's sudden decision to open his country to trade and intercourse plunged the Baluba into one of the strangest of civil wars, the old and conservative men, who were hostile to the innovation, being pitted against the young and progressive element. The old men were beaten, and no longer had a voice in public affairs. Formerly cannibals, the Baluba voluntarily abandoned the practice, which they now regard with horror. Their old men are the most elaborately tattooed of all African peoples, the designs being rather ornamental in effect instead of merely disfiguring, as on the Upper Congo. Many of their young men, however, are not tattooed at all, and the progressive people are putting this relic of barbarism behind them. Once nearly naked, the chiefs now wear cotton clothing, fashioned after the garments of white men, and discarding their old huts, they live in houses like those they see at Luluaburg. Wissmann says the Baluba are the most intelligent and progressive people the whites have met in the Congo Basin. "They ask an explanation," he remarks, "of everything they do not understand. Many of them question us about death, the future world, and the soul. They stand for hours asking the shrewdest questions, and unlike most negro tribes, they have unbounded confidence in the white man. After our explanations, their next question often is, 'How do you know that?'"

Calemba's sister, Sankula, his chief adviser and his lieutenant on every war expedition, is as noteworthy a person as her great brother. Bateman says she is "a woman of great intellectual power and force of character." Calemba and Sankula, with two hundred of their subjects, accompanied Wissmann to Stanley Pool, where Mr. Whitley wrote of the princess, "I have seen her with a single wave of her hand arrest the whole crowd in the maddest whirl of the dance, and impose silence on the assembly as completely as though they were petrified." She has been the faithful friend of the whites. The Baluba respect the property of their white visitors, but they are deceitful, and are given to the exceedingly bad habit of selling even their own wives and daughters, if necessary, to procure the ammunition they covet; and yet, Mr. Bateman says, they are the only tribe among whom he has seen manifestations of mutual affection between husband and wife.

XI.

The next most noteworthy people are certainly the Bangala, whose long street villages line the Congo banks above the equator. Grenfell estimates that these three to five rows of rectilinear gable-roofed huts, stretching away almost uninterruptedly for over twenty miles, contain rather more than 100,000 people. Behind the villages extend large fields of manioc and bananas, and here and there in the streets under great trees are the places of public assembly, where business is done and orators harangue the people; for the Bangala are very fond of speech-making. Nowhere else does the great river present a more animated scene. Skilfully handled canoes, laden with all manner of produce, and paddled by large, muscular fellows, are darting here and there. Women, singing at their paddles, and wearing only a fringe of palm fibres about a foot long, suggesting the costume of ballet-dancers, are off to the islands to gather firewood. Fishermen by the hundred are going to their nets. Funeral convoys, the dead wrapped in palm bark, and the relatives intoning a mournful chant, appear and disappear among the islands; and now and then some great man in his big canoe, and surrounded by his women, draws a crowd of villagers to the bank, where they gaze and gossip and chatter. Five thousand men of this tribe are now enrolled in the militia of the Congo State, and many of them are scattered over 1300 miles along the river from its mouth to Stanley Falls. What a wonderful new chapter has been opened in their history since ten years ago, when they had never heard of the great Congo cataracts, only a few days' journey below them!



HUMAN SACRIFICES AT EQUATOR STATION.

XII.

For great distances along the Congo its mountainous scenery is unbroken by a single evidence of human life. Then will come a long succession of villages, crowded closely together. It is impossible to give any satisfactory estimate of the population of the Congo Basin, but it is believed to be not less than 20,000,000 people. Some explorers are of the opinion that it is double this number. Every traveller who strikes out in a new direction dots the white spaces on the map with scores of villages. The surveys for the Congo Railroad have added over one hundred and sixty villages to the map of the cataract region. Van Gele, who in 1888 proved that the Mobangi is the Welle-Makua River, rising almost within sight of the Nile, says the Mobangi is the most densely peopled part of Africa he has seen. The great Mobangi people, whose territory skirts the Congo for a long way south of the big affluent, are believed to number a million souls. Van Gele counted 105 considerable villages on the Mobangi and its three lower tributaries, and at one town he counted 300 canoes carrying the women to work in the morning. Between the Bayansi and the Bangala on the Congo there is hardly a gap separating the villages. Bolobo has a population of 30,000 souls, public squares, and streets. The largest settlement Wissmann saw in the Lower Congo Basin contained, he believed, 20,000 souls. Wolf, on the Sankuru, saw a town of 4000 people. Bateman says the largest crowd he has seen in Africa was at a market-place where the Lomami joins the Congo. A space as large as Trafalgar Square in London was densely thronged. In Garenganze, Arnot counted forty-three villages in two hours' tramp around the capital Mukuru. On the Upper Tchuapa Von François counted 2300 huts in ninety minutes' steaming up-river. Thus, although large areas are almost destitute of inhabitants, there are many important centres of population, and almost everywhere the explorers have found enough people to amply supply them with food from their fields.

Throughout Van Gele's great journey up the Mobangi he did not open one of the sacks of rice he had brought from the Congo. He had not seen elsewhere such affluence of all sorts of provisions. The Mobangi is the longest Congo tributary, but several lesser affluents are navigable for a longer distance. After ascending the Mobangi nearly as far as from New York city to Buffalo, it is found to be interrupted at Zongo by cataracts, above which it is again navigable; and it is above these cataracts that Van Gele found the densest populations and the greatest abundance of provisions. The gently sloping hills were covered with thousands of huts, sometimes grouped in villages, sometimes forming wide streets, and, again, built in circles, with mounds in the centre, from which the chiefs address the people. The women here are unique in their methods of hair-dressing. They extend their hair by means of braids to a length of five or six feet, and often tie the braids around their arms.

XIII.

Next to cannibalism, the most terrible practice in the Congo Basin is that of human sacrifices on the occasion of the funeral ceremonies of important persons. The richer the family of the deceased person the more numerous are the victims. Many photographs of Upper Congo huts that have reached this country show the ridge-pole adorned with human skulls—ghastly relics of these murderous scenes. The natives cannot understand the horror with which the whites regard this practice. "Surely," they said to Coquilhat, "since you white men are so much richer than we are, you must sacrifice many slaves when your great men die." Because far up the tributaries slaves can be bought much cheaper than on the Congo, canoe parties are sent for hundreds of miles for the sole purpose of buying victims for human sacrifices. As a rule these hapless captives meet their fate without a tremor. They are blindfolded, bound to a stake in a sitting or kneeling posture, and a single blow of the skilful executioner's knife decapitates them. Coquilhat made a picture of one of these terrible scenes at Equator Station, where fourteen strong men met their fate surrounded by a howling mob, whose din was enhanced by a dozen ivory horns and the roar of drums as the knife descended. Though men form the greater number of victims, wives or female slaves are often strangled and thrown into the open grave or buried alive in it. Only once have the whites seen a woman beheaded, and the shrieks of the poor creature were in striking contrast to the dogged and sullen submission to the fate of the other victims. Coquilhat says the men regarded his opposition to the custom with pity or contempt, but some of the women secretly said to him, "It is bad."

The good day is coming when this terrible custom and other savage enormities will be abolished in the Congo State. King Leopold's government is rooting them out as far as its influence extends. It is placing gun-boats on the upper river and building military stations on the Aruwimi, the Lomami, and the Sankuru to put an end to Arab slave raids and to the practice of buying or capturing human victims for the executioner's knife or the cannibal feast. Nearly a hundred chiefs in the past year have agreed to abolish human sacrifices and to help enforce the regulations of the State for preserving peace and protecting human life.

XIV.

King Leopold's enterprise is without doubt the greatest philanthropic project of the century; and although many years must elapse before its possibilities for civilization and commerce are fully known, the remarkable work of the past few years justifies the hope that the Congo State will achieve a grand and beneficent destiny. We are beginning to understand that a large part of this region is at least as habitable as India, as soon as white men learn to adapt their habits of living to its climatic conditions. The famous traveller Burton said of Boma that it was one of the most insalubrious holes in the world. It is now the capital of the Congo State. In 1888 there was not a death among the thirty to fifty white men who live there, and recently three hundred Europeans were at one time in the settlement, whose total white population when Stanley first saw it was sixteen souls. Owing to excessive rainfall, however, the past season on the Lower Congo has been very unhealthful.

Workmen are now turning the first sod on the railroad around the Congo cataracts whose route is shown on our map. Every dollar needed to build the road has been subscribed, and there is every reason to believe the road will give an enormous impetus to the development of the Upper Congo. Mr. Tisdel, our commercial agent, writes that the demand for cotton goods is at present enormous, but that it will increase ten-

MME. LILLI LEHMANN-KALISCH, IN THE TITLE RÔLE OF GOLDMARK'S OPERA "THE QUEEN OF SHEBA."—Drawn from Life by Arthur J. Goodman.—[See Page [illegible]]

BOOKS ON THE CONQUEST OF AFRICA.

THE STORY OF EMIN'S RESCUE AS TOLD IN STANLEY'S LETTERS. Published by Mr. STANLEY'S Permission. Edited by J. SCOTT KELTIE, Librarian to the Royal Geographical Society. With Map of Route and Three Portraits. 8vo, Cloth, 50 Cents. (*Just Published.*)

THROUGH THE DARK CONTINENT; or, The Sources of the Nile, Around the Great Lakes of Equatorial Africa, and Down the Livingstone River to the Atlantic Ocean. With 149 Illustrations and Colored Maps. 2 vols., 8vo, Cloth, $10 00; Half Morocco, $15 00.

THE CONGO AND THE FOUNDING OF ITS FREE STATE. A Story of Work and Exploration. With over One Hundred Full-page and Smaller Illustrations, Colored Maps and Marginal Notes. 2 vols., 8vo, Cloth, $10 00; Half Morocco, $15 00.

COOMASSIE AND MAGDALA: The Story of Two British Campaigns in Africa. With Maps and Illustrations. 8vo, Cloth, $3 50.

THE HEART OF AFRICA. Three Years' Travels and Adventures in the Unexplored Regions of Central Africa. From 1868 to 1871. By Dr. GEORG SCHWEINFURTH. Translated by ELLEN E. FREWER. With an Introduction by WINWOOD READE. With about 130 Wood-cuts and Two Maps. 2 vols., 8vo, Cloth, $8 00.

LIVINGSTONE'S EXPEDITION TO THE ZAMBESI. Narrative of an Expedition to the Zambesi and its Tributaries; and of the Discovery of the Lakes Shirwa and Nyassa. 1858–1864. By David and CHARLES LIVINGSTONE. With Map and Illustrations. 8vo, Cloth, $5 00; Sheep, $5 50.

LIVINGSTONE'S LAST JOURNALS. The Last Journals of David Livingstone, in Central Africa, from 1865 to his Death. Continued by a Narrative of his Last Moments and Sufferings, obtained from his faithful Servants Chuma and Susi. By HORACE WALLER, Rector of Twywell, Northampton. With Maps and Illustrations. 8vo, Cloth, $5 00; Sheep, $5 50.

ISMAILIA: A Narrative of the Expedition to Central Africa for the Suppression of the Slave Trade, organized by Ismail, Khedive of Egypt. By Sir SAMUEL WHITE BAKER, Pasha. With Maps, Portraits, and upward of 50 Full-page Illustrations. 8vo, Cloth, $5 00.

CENTRAL AFRICA: Naked Truths of Naked People. An Account of Expeditions to the Lake Victoria Nyanza and the Makraka Niam-Niam, West of the Bahr-el-Abiad (White Nile). By Colonel C. CHAILLÉ LONG. Illustrated. With a Map. 8vo, Cloth, $2 50.

Published by HARPER & BROTHERS, New York.

LARGE-SIZED PEA-NUT POLITICS.

BETWEEN the autumn elections and the meeting of the State Legislatures at the beginning of the year there is always an apparent lull in active politics, although it is supposed that the active politician never rests. During the recent political lull the most active, or at least the most actively discussed, politician was Governor HILL, of New York. The secret of his activity was believed to be his desire of the Presidential nomination of his party in 1892, and his consciousness that he must owe his success less to personal ascendency than to skilful management. In this latter respect his eminence is conceded. Indeed it was the recognition of this kind of ability which interested Mr. TILDEN in young Mr. HILL, and first brought him forward in politics. The Governor has apparently decided that the traditions and character of his party are stronger than any Democratic personality; that the party will certainly sustain the regular nomination; that no candidate will be nominated who is not supported in the Convention by the delegation of his own State; that the electoral vote of New York, if not decisive in the election, should be secured if possible; that he can command the State delegation in the Convention; and that he has already proved his ability to carry the State against great odds in an election.

Discourse and enthusiasm about principles and national policies the Governor evidently regards as sentimental rhetoric, a kind of verbal fireworks and banners and transparencies and lively chorus, which animate a campaign and produce desirable excitement, while the actual work is done by bargains, patronage, careful calculations of interests to be propitiated and prejudices to be flattered. When speeches must be made, generalizations about the true and ancient and time-honored Democracy, the greatness and wisdom of the people, and the wickedness of attempts, under the plea of reform, to deprive ignorance and drunkenness and corruption of their just part in the government, judicious approvals of measures which have been adopted by the party, and of leaders who have held high office, and throughout a plain sympathy, implied rather than expressed, with the reactionary rather than the progressive tendency of the party—all this is obviously held by the Governor to be the safer course. No man in the party, the Governor seems to say, holds a mortgage upon the Presidency; certainly no man who, while holding the office, has been defeated at the polls. Politics are practical. The successful candidate is a man in full sympathy with the spirit and average intelligence and feeling of the party, not a man who stands for what he thinks it ought to be, and who is therefore regarded with jealousy as assuming to be superior to his comrades. I am a Democrat—that is, I am for the saloons and for all the old practices and cries of Democratic politics, and against the new-fangled reforms and airy pretences of public virtue.

This is apparently the view and the purpose of Governor HILL, and his position is not one to be dismissed with a sneer. It is substantially the view of bosses and managers and politicians in all parties, and the practical power of such machine politicians was never greater than now. Democratic orators at tariff reform dinners and Democratic editors in enthusiastic journals will hear of nothing but Mr. CLEVELAND as the candidate. But how many Democrats in New York voted against Governor HILL last year? With the party organization in the State wholly in the hands of the Governor, with all the evidence which a Convention can consider that he and not Mr. CLEVELAND represents the party in the State, would not the Convention hesitate? If the friends of Mr. CLEVELAND should remark significantly that Governor HILL could not and should not carry the State, could not the Governor's friends make the same remark and very much more effectively? The moral of such a situation is that honest and patriotic men should refuse to sustain their party in doubtful or plainly wrong courses, because a party must always pay the penalty of its traditions. A few honest, enlightened, and earnest men, united upon a great and beneficent policy, may organize a new party much more readily than they can wrest an old one to their purpose. This fact was illustrated in the movement of the conscience Whigs and the free-soil Democrats nearly fifty years ago.

PATERNAL GOVERNMENT.

THE question of a protective tariff, as Mr. GLADSTONE shows in his recent article, is not one of infinite and complex details only, into which experts alone can hopefully enter, and in which they often merely array assertion against assertion, but it is one which involves great principles of government. Its chief principle is foreign to the American doctrine of liberty, because, as its name implies, it is paternalism. Protection is paternalism applied to trade or commercial intercourse, as the various degrees of despotic administration in other countries are paternalism in the sphere of politics. The public authority which regulates individual freedom in travel, in residence, in public meeting and debate, in speaking, in writing, and in voting, is akin to that which restricts the same freedom in buying and selling. It is indeed an authority which, under the plea of the public good, tends to absorb every function, and instead of exercising only the power which is expressly given to it, assumes that the individual may exercise only such freedom as it may permit. LOUIS NAPOLEON, in the effort to establish his personal rule in France, called himself the savior of society, which is the ancient plea of despotism.

This general view was admirably and forcibly stated at the late dinner of the Tariff Reform League in Boston by Mr. JOHN M. FORBES, who until recently was one of the strongest and most liberal and efficient Republican leaders in New England. But upon the question of protection as in itself a good and wise policy he has parted with the party. He cited the course of events in France under the two empires, which ended in fearful disaster for the French people. Every omnibus wheel and post-horse wore the government badge. The interfering hand of public authority reached everywhere. Overtaxation, extravagance, corruption, jobbery, and all forms of tyranny and injustice, and the general dry-rot under which the Second Empire crumbled, were due to the spirit of paternalism, which Mr. FORBES defines as over-government or an absorbing centralization, as opposed to local government, or LINCOLN'S government "of the people, by the people, for the people." High tariff, posing as protection of the poor laborer, and holding on to a surplus which breeds extravagance, corruption, and jobbery, necessarily tends to a reaction in which the laborer will be the sufferer. Moreover, he argues, it is the precursor of socialism or communism; for if the interests of trade may be properly protected by government at the expense of other interests and industries, those other interests may in turn, and logically, be equally protected by government, until Mr. BELLAMY'S Look Backward will be shown to be merely a Look Forward.

This is the philosophy of protection. It is a form of paternalism, and therefore it is not agreeable to what we may call Americanism, in which Mr. FORBES has great confidence. Whatever may have seemed to American enlightenment and common-sense in a certain degree and under certain circumstances permissible or desirable, yet the tendency to convert a medicine or a stimulant into daily food or drink must be jealously watched. He finds comfort in LINCOLN'S shrewd saying, "You may fool some of the people all the time, and all of the people some of the time, but you cannot fool all the people all the time," and from BURKE'S famous sentence, "The people never give up their liberties but under some delusion." The paternal aspect of protection is well worthy universal attention, apart from the contested details of the tariff schedules.

NEW YORK AT WASHINGTON.

THE New York Committee on the World's Fair decided to make an imposing and, it is hoped, a persuasive appeal to Congress, which will result in the choice of this city as the seat of the Fair. There should seem to be no doubt of this result; but for that very reason there is doubt, because the delay shows that apparently the decision will be made upon other considerations than the merits of the case. New York is the chief city and the great commercial port of the country, and its facilities of access and of accommodation are unsurpassed. The exhibition is to be international, and the name of the city is familiar throughout the world, which regards New York as bearing the same relation to this country that London bears to England and Paris to France, so that the selection of any other place for such a purpose would excite wonder and inquiry and demand explanation, while transshipment and long land carriage of foreign articles designed for exhibition would repel exhibitors.

New York, also, has subscribed the necessary guarantee fund, and the General Committee contains the names of eminent citizens, who are universally known throughout the country, and who attest the active co-operation of the representative citizenship of the city in the great enterprise. There is nevertheless doubt, as is shown emphatically by the fact that an imposing representation at Washington to urge the choice of New York is thought to be desirable. The truth is that, as usual, there are some politics in the affair. Every great public proposition, of whatever character, is instantly scanned with jealousy and suspicion by the chiefs of rival political parties, to estimate its bearings upon party interests. The project of the Fair is seen to be coincident with the return of Tammany Hall to complete supremacy in the city, and as the Fair will take place in the year of a Presidential election, the question presents itself to the political mind, which party will probably secure the larger profit in the enormous patronage and jobbery which accompany such an undertaking!

This, however, is a question which cannot be publicly presented and argued. The speeches are naturally pitched in a high patriotic key, and eloquently advance the conclusive general arguments. If the voting should accord with the weight of argument, an imposing array of citizens would not be necessary to enforce the plea. But New York is not exactly a favorite in Washington. The State and the city are conscious of their importance, and yet, with notable and familiar exceptions, their representation in Congress does not profoundly impress the members with the conviction that size is greatness. There is, in fact, a certain willingness to "take down" the imperial State and the metropolis of America which may affect the voting. But neither the political feeling nor the desire of snubbing ought to affect such a decision as that of Congress upon the place for the World's Fair, and therefore the decision will furnish an excellent illustration of the spirit and wisdom of the national Legislature.

SCHOOLS AND PRISONS.

IN every American community the prisons and the schools are subjects of the first interest, because of the conviction that the more comprehensive and efficient the school system, the less burdensome will be the prisons. We have already remarked that Mr. DRAPER, the Superintendent of Public Instruction, and a singularly intelligent and devoted officer, tells us that in this State, while the schools during the last year cost us about $16,000,000, the percentage of attendance was smaller than in any preceding year. He is followed by Mr. LATHROP, the Superintendent of Prisons, who says that the year shows a deplorable disintegration of prison industries, a moral deterioration among the prisoners, with an unprecedented rate of death and insanity, and a greater financial deficit than for thirteen years. He is entirely justified in saying that it is "perhaps the most unsatisfactory and most unfortunate year that has been experienced in our State certainly for a long term of years."

The two reports together present a very disagreeable picture of the present condition of these two most important systems. The Superintendent of Public Instruction recommends a strict and efficient compulsory law. It is a simple and obvious remedy. A State which spends sixteen millions of dollars a year upon free schools should take care, in justice to the people who pay that enormous tax, that the money is spent to the utmost advantage. Lieutenant-Governor JONES is reported to object to the ballot law that it disfranchises the ignorant voter. But with adequate free schools maintained by the State, why should a voter plead that he cannot read? Whose fault is it? And why should the fault be pleaded as an argument against a most desirable law? Why should we all be exposed to the consequences of political corruption because somebody has been too lazy or too careless to learn to read? The law as proposed makes provision for aiding such a voter at the polls, but without weakening the law. To weaken the law to aid him would be a gross public wrong. Having provided the opportunity of education for every citizen of New York, let New York now take care that the opportunity is not neglected but improved. Those who refuse to avail themselves of the provision should pay the penalty. Certainly the laws should not be weakened to conform to their neglect.

The wretched condition of the prisons is due to politics; that is, to the futile attempt to conduct the prisons not upon wise and approved principles of effective management of penal industries, but at the will of demagogues to win votes at the polls. The contract system was abolished because it demoralized the prisoners. It was condemned by the most careful and experienced observers, who held that the prisons were not to be managed solely with the purpose of making them self-supporting, but that the character and reformation of the prisoners must be chiefly regarded. The law of 1888, which practically suspended prison labor so that it might not compete with outside labor, soon brought the prisons into an absolutely intolerable condition, and showed the logical result of a management which was based upon extrinsic considerations. The law which was responsible for this outrage, both upon the prisoners and upon the people at large, was superseded by the act of last year, which aims to employ the prisoners, with carefully adjusted regard to competition with outside labor and to the self-support of the prisons. The results of this law, which are only now appearing, the superintendent finds to be encouraging, and it is very improbable that the demagogues will soon deal another blow at the prisons so disastrous as the law of 1888. But it will be long before the State recovers from the effects of that outrageous legislation.

THE REAL POINT OF ATTACK.

THE opposition to the confirmation of General MORGAN as Indian Commissioner is placed upon its true ground by the Roman Catholic Archbishop IRELAND in a letter to the Philadelphia *Press*. The Archbishop's letter gives a new and significant and national importance to the whole question, which should be well understood. The Archbishop says:

> "The policy of Mr. MORGAN is to discourage and, as soon as possible, eliminate the mission or so-called contract schools among the Indians, and build up exclusively the purely governmental or government schools."

Mr. HERBERT WELSH points out that General MORGAN'S present plan is simply to make the government Indian schools as efficient as possible, and

> "to secure from Congress sufficient appropriations of money to insure the education, through these means, of all Indian children of school age who are not at present provided for either in government schools or in the mission schools of the various religious bodies."

General MORGAN has given during the year more than $350,000 to the Catholic contract mission schools. But his view is the true one, that ultimately, when the government schools are thoroughly established as entirely efficient, government aid to sectarian Indian schools may be wisely discontinued.

Archbishop IRELAND says that purely secular education is not good for Indian children. But the policy of the government of the United States does not favor grants for sectarian schools, while it does not discriminate among religious bodies in the appointment of teachers. This also is the true policy. The opposition to the confirmation of General MORGAN is plainly a sectarian attack upon the public-school system, and his defeat by such an assault would be a very serious public misfortune.

LOOKING BACKWARD.

THE bill introduced in the Senate for the appointment and retirement of General JOHN C. FREMONT as a Major-General in the army recalls a familiar figure of thirty-four years ago. His nomination for the Presidency by the Republican party was a striking illustration of the methods of American politics. The slavery question had become so supreme that it dissolved the Whig party in 1852, and organized the Republican party in 1853, which in 1856 cast 1,341,264 votes for its Presidential candidate against 1,838,169 for BUCHANAN, and 874,534 for FILLMORE.

But the remarkable fact was that a party which suddenly arose upon a moral issue, and which was so powerful as almost to succeed in its first campaign, should have selected for its candidate not one of its many conspicuous and well-known and able leaders, identified with the growth and development of the party and of the strongest antislavery convictions, but a young man of half foreign and Southern birth, known chiefly as an adventurous and daring explorer, and although of antislavery views, of Southern and Southwestern associations and connections. There was, in fact, no very general definite knowledge about him. But he received the nomination over Mr. SEWARD, the accepted Republican chief, and Judge McLEAN, a Western conservative and conciliatory Republican, because of "availability."

The campaign that followed was unprecedented for its intense feeling. On the Republican side, moral enthusiasm took the place of ordinary party spirit. The campaign appeals were addressed to the conscience, the primary sense of right and justice. They were not ingenious arguments for a policy; and Mr. SEWARD, after recovering from his disappointment, showed in most impressive detail the complete ascendency of the slave power in every part of the government. The candidate, FREMONT, who was little seen in public and said nothing, was a figure of romance and a symbol of the great party which was to be "the Pathfinder" of freedom. The more unknown he was, the more freely imagination could represent him as the gallant and noble embodiment of true Americanism. The younger men were perfectly confident of success, but defeat consecrated them only the more closely to the cause until it triumphed. The real FREMONT of those days is now an old man. But the FREMONT for whom those youth spoke and sang and toiled never existed.

A QUESTION ANSWERED.

A CORRESPONDENT in Ohio asks why a better plan than that of the separate compartment in the Australian system would not be the sending of the tickets to voters a week in advance for reflection and preparation. Because they would then be "cooked" by the bosses and captains. The law is aimed at corruption and coercion. But the suggestion of our correspondent opens the door to both. It is the voters who do not wish to "reflect and prepare" in a good sense that the law would prevent from being used by traders of every kind and degree. Actual practice has amply proved the advantage of the compartment.

THE AMERICAN WAY.

EVERYBODY in Brooklyn will be glad to hear that Postmaster HENDRIX will be allowed to serve out his term, which ends in June next. The reason is that he is so good and satisfactory an officer. How many Brooklynites will be really glad six months hence, when longer service will have made him by so much a better and more satisfactory officer, to see a new and inexperienced man appointed in his place, who will remove as many of his good and satisfactory subordinates as the law will permit, while the public will necessarily suffer? If this kind of folly occurred under a despotism, we should pity the poor people who were made its victims. But Brooklyn people, although living under a republic, can recall for their consolation the Irishman who was accommodated with a sedan-chair without a bottom, and subsequently remarked that, except for the name of the thing, it was mighty loike walking.

CLEAN NEW YORK.

PEOPLE in all parts of the country will be delighted to know that Mayor GRANT, of New York, says in his annual message that it is the firm purpose of the city government to secure clean streets, and that no excuse will be accepted for dirty thoroughfares. The only exception to be taken to this remark is its tense. We have long enjoyed future clean streets and reforms of many kinds yet to be accomplished. The good New-Year resolutions of the messages of Presidents, Governors, and Mayors are familiar, and in themselves exhilarating. They are, indeed,

> "Ever charming, ever new;
> When will the 'prospect' tire the view?"

But a clean street would be also new and charming.

WHY "CONGRESSMAN"?

THE Constitution of the United States says that all legislative power which it grants shall be vested in a Congress, which shall consist of a Senate and House of Representatives. The two together compose the Congress, and a member of either House is a member of Congress, or, if a very clumsy single word be preferred, a Congressman. But a Representative is no more a member of Congress than a Senator, and therefore no more entitled to the appellation. If a Senator should assume to be distinctively and especially a Congressman, he would be ridiculous. How is it with a Representative who should make the same assumption?

But if he could not justly claim such a name for himself, nobody could properly bestow it upon him. In New York the popular House is called the Assembly, and a member is therefore properly called an Assemblyman. But the popular House of Congress is called the House of Representatives, not Congress, and consequently a Representative is most improperly called by distinction a Congressman. There is nothing gained in definiteness of description, or even in time of pronunciation, by calling a Representative a Congressman. It is just as easy to say "My Representative" as "My Congressman."

The use of the word Congressman for Representative has become so general that it is likely to continue. The plea would be that as a Senator is always called Senator, no confusion arises from calling a Representative a Congressman. But the objection lies in the unnecessary incorrectness. Nothing is gained in definiteness, in picturesqueness, in convenience, or in any other way. It is like saying fust for first, or git for get—simply incorrect.

SPACE WANTED IN THE WORLD'S FAIR.

THE question of rapid transit in the city of New York is one of the deepest interest to millions of men and women in and around the city. Indeed, the interest of women is only numerically less than that of men. The immense business of shopping makes an ample and convenient system of transit in the city indispensable to wives and mothers, who, however, are seldom mentioned in the discussions of the subject. The extreme pressure upon the present accommodations of street travel and the large foreign population of the city are already impairing native American courtesy, and the street and elevated cars are not a good "school of the gentleman."

One of the projects with which the legislative year opens at Albany is a scheme for rapid transit in New York. But the instant it was announced it was enveloped in a cloud of conflicting rumors and assertions involving the usual jobbery and speculation, and raising the question whether the city can obtain any public relief or convenience without a degree and amount of corruption which make it a public misfortune. When such schemes are announced, the prompt denials of many citizens whose names have been associated with them that they have any concern with them whatever, greatly disturb public faith in the accuracy of newspaper statements. The desperate rivalry of enterprising reporters to secure "beats" for their journals may even recall to the reflective reader the gibe of Horace Walpole, "Read me anything but history; for that, I know, is a lie." Mayor GRANT, in his message, says that what the municipal authorities want is the best system of rapid transit at the earliest day. That is the universal want, and it is delightful to know that the Aldermen share the desire. But what those eminent public functionaries and the city members of the Legislature might hold to be "the best system," opens a wide field of speculation.

All that is distinctly known is that if the great body of intelligent and industrious citizens of New York, obstructed and exasperated by the present inadequate resources of transit, desire to secure, through the representatives whom they have elected, the best system of transit in the shortest time and at the smallest cost, they cannot do it. That is the one certain thing. The Equitable Assurance Company can erect a magnificent and convenient building within a year or two in the best manner and at a reasonable cost. The State of New York, after spending sixteen or seventeen millions of dollars during twenty years to build a Capitol, must yet pay some four or five millions to finish it at some indefinite future time. How would it do to include the new Capitol at Albany and the dirty streets of New York in the World's Fair as illustrations of the promptness, cheapness, convenience, and satisfaction with which great public works of all kinds are accomplished in the chief State of the republic?

PERSONAL.

MRS. LUCY HOOPER, whose husband has for many years been Vice-Consul at Paris, has just succeeded in disposing of her play *Helen's Inheritance*. Her daughter, who has studied dramatic art abroad, brought the play to this country, and by her acting of the principal rôle insured the purchase of the drama. Mrs. HOOPER has been long and favorably known as the Parisian correspondent of several American papers, and has also won reputation by her book *Under the Tricolor*.

—MRS. ABBY SAGE RICHARDSON, in her dramatization of Mark Twain's charming book *The Prince and the Pauper*, has adapted the title rôles expressly for ELSIE LESLIE. In this new version of the work both parts are to be taken by the same actor, instead of, as heretofore, requiring two persons to fill them.

—Professor MURRAY, who has recently been chosen to succeed the famous Professor JEBB in the chair of Greek at the Glasgow University, is but twenty-five years old. He has also written a novel, something after the RIDER HAGGARD style, and has gone into politics, espousing the home-rule cause.

—General JAMES LONGSTREET, the Confederate, has lost his wife. She was a daughter of General JOHN GARLAND, of the regular army, and was with her husband in much of his service on the frontier, in Mexico, and during the civil war.

—The Ladies' Hermitage Association has been formed of Southern ladies, to take charge of and preserve The Hermitage, General JACKSON'S former home, about twelve miles from Nashville, Tennessee. The property includes the house and tomb of the General, and twenty-five acres of land, with numerous relics.

—The late HORATIO ALLEN, of Montrose, New Jersey, ran the first locomotive that was ever used in this country. He was sent to England in 1826, by the Delaware and Hudson Canal Company, to buy the rails and three locomotives for a railroad of sixteen miles, which they wished to build in connection with their mines in the Lackawanna Valley. Having performed his commission and built his road, Mr. ALLEN could find no one to act as engineer on the locomotive he had imported, the task being considered most dangerous; so he took hold of the lever, and ran the engine several miles down the track and back, to prove that it was safe. Mr. ALLEN was graduated at Columbia College and studied law, but left that profession for the more congenial pursuit of civil engineering, in which he gained prominence.

—Major SERPA PINTO, whose conduct of Portuguese affairs in Africa has roused the ire of the British lion, is a native of Portugal, and forty-four years old. He joined the Portuguese army in 1863, and has made himself exceedingly valuable to his country in the general European scramble for dominion in Africa.

—MARY ANDERSON is thirty years old, and has been on the stage fourteen years. She has had numerous offers of marriage, but is still heart free, she tells her intimate friends, and recent reports of her engagement to a New York young man are without foundation.

—Lincoln College (Oxford) has recently bought a picture of JOHN WESLEY, which is either the original or a replica of a picture painted by JAMES WILLIAMS in 1743, when WESLEY was a fellow of Lincoln.

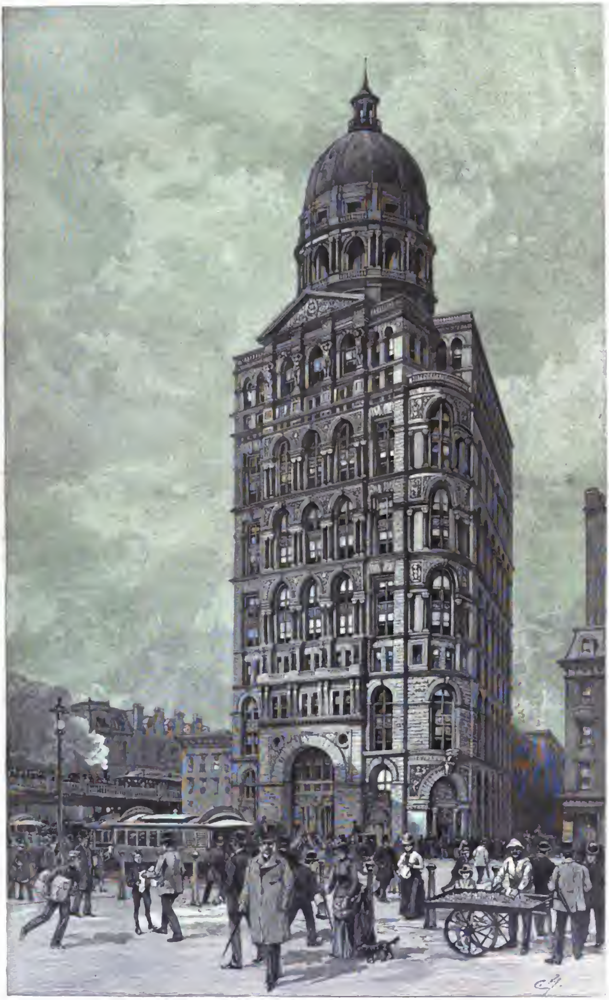
—Notwithstanding the pressure of public cares and the burden of eighty years (which, however, do not seem to sit heavily on his shoulders), Mr. GLADSTONE has found an opportunity to examine and commend HARPER'S YOUNG PEOPLE. In his article in the current number of the *North American Review* Mr. GLADSTONE says of the YOUNG PEOPLE, "It far surpasses all that the enterprise and skill of our publishers have been able to produce." Such a commendation is very gratifying, and the more so because it is entirely spontaneous—a fact which need hardly be stated, in view of the connection in which the words appear.

—The engagement of Miss ELLEN BAYARD, the youngest daughter of the ex-Secretary, to Count LEWENHAUPT, who was a member of the Swedish legation at Washington during her father's term of office, is announced. The count is now studying practical mechanics in this country.

—One of the survivors of the famous charge at Balaklava lives in Hartford, Connecticut. He is JOSEPH HOWE, an ornamental plasterer, and carries the marks of the battle on his face and neck, which were badly cut by pieces of shell. Although HOWE came to this country twenty-five years ago, he has never been made an American citizen.

—CLARK HOWELL, who has been chosen to succeed the late HENRY W. GRADY as managing editor of the Atlanta *Constitution*, is twenty-six years old. He has, nevertheless, served two terms in the Georgia Legislature, and has been connected with papers in New York and Philadelphia, besides working on the *Constitution*.

—Rev. HENRY W. SYLE, M.A., the first deaf-mute ever ordained to the ministry in this country, has just died in Philadelphia, where he was rector of All-Souls' Church. He was born in China, his father being a missionary, and completed his education at Yale, after studying for a while at Cambridge, England, and two other European colleges.



THE PULITZER BUILDING, THE NEW HOME OF THE NEW YORK "WORLD."—Drawn by Charles Graham.—[See Page 47.]

RECENT DISCOVERIES IN THE CONGO BASIN.

(Continued from page 40, Supplement.)

fold after the railroad reaches Stanley Pool. No one supposed there would be any trade with the Upper Congo until steam-cars superseded the present expensive system of carriage on the backs of men; but several trading companies have already found it profitable to launch steam-boats at Stanley Pool, and their stations are scattered along a thousand miles of the upper river. Over a half-million dollars' worth of Upper Congo ivory was sold last year at Antwerp. Seven years ago Stanley bought the first tusk of ivory purchased by a white man on the upper river. He paid a few handkerchiefs for it. Tribes have been found who had no notion whatever that ivory had any commercial value. Grenfell says that on the Kasai tusks worth fifty dollars apiece have been bought for two necklaces of black beads, and on the northern tributaries tusks were often offered to Jacques de Brazza for a few cents' worth of gewgaws. It is not its ivory, however, but its capabilities for producing coffee, tobacco, cocoa, and other tropical products that will gradually open a promising future for the Con[illegible]sin.

We know too much about the Congo Valley now to cherish any illusions. It is not an El Dorado. Its climate, save in some of the uplands, is very trying, and its people hate work and have few wants. But the many men who have studied its problems well have not a particle of doubt that the Congo Basin is destined to add largely and permanently to the world's wealth. Strong in this faith, a half-dozen companies have been organized within a year to build the railroad, to erect depots for the sale of merchandise and European food, to breed cattle, to produce palm-oil, to build hotels, and to start plantations. These projects are not merely on paper, but are actually under way. In the philanthropic aspects of the great work we see about two hundred missionaries already toiling in these fields, seeking to evoke the better nature of these untaught millions. A new world has been discovered, and all Christendom will watch with interest the many phases of its slow but certain progress.

The little volume just published by Harper & Brothers,* giving the story of Emin's rescue as told in Mr. Stanley's letters, is particularly timely, including, as it does, all the explorer has yet written of his great discoveries, his thrilling adventures and perils, the fall of Emin's province, and the complete success of the expedition. Mr. J. Scott Keltie, the well-known geographical writer of London, has written an introduction giving a valuable summary of the facts that led to sending Stanley to Emin's rescue, and the Emin Pasha Relief Committee contributes some interesting matter that has not before been made public. A more brilliant epitome of this remarkable trip across Africa could not be written than that which Stanley's own graphic pen has supplied. The brochure will also be noteworthy as containing, with other portraits and a fine map of the route, the only good likeness of Tippu Tib, the famous trader and the richest man in Central Africa, that has yet been published. It is reproduced from a fine photograph of that powerful chief taken last year at Stanley Falls.

* *The Story of Emin's Rescue as Told in Stanley's Letters.* Published by Mr. Stanley's permission. Edited by J. Scott Keltie, Librarian to the Royal Geographical Society. With Map of the Route and Three Portraits. 8vo, Cloth, 50 cents.

THE NEW YORK "WORLD."

The success of the *World* newspaper under the management of Mr. Pulitzer is one of the most important business achievements of recent years. It is fitly crowned and attested by the erection of the great building, the picture of which is presented in this issue of Harper's Weekly. The site is the corner of Park Row and Frankfort Street, and the dimensions of the lot are 115 by 136 feet. The architect is Mr. George B. Post, who was also the designer of the *Times* building.

The *World's* new building will tower above the highest of its neighbors. The occupants of the uppermost room in the domed tower will be eighteen stories above the ground floor. The compositors will be in the thirteenth story, under the flat roof. Eleven stories contain 150 large offices. The tower, which is 50 feet in diameter, is to be devoted to the writing force of the newspaper. On one floor will be the city staff; on another, the editorial writers; and on the others, the special writers, department men, weekly edition staff, file room, library, etc. On the flat roof is to be built the art department of the *World*, including a completely furnished photographic gallery. Here also is to be a restaurant for the employés of the paper.

Under the building are great cavernous spaces for the machinery and for the delivery department. A driveway from Frankfort Street will admit wagons for the reception of the papers, which will come up from the press-room on four fast-running pneumatic elevators. The press-room, in the sub-basement, has a capacity of ten quadruple presses, equivalent to forty web presses. The machinery will be driven by a 300 horse-power Corliss engine. The storage room for paper will be in the basement, and will be capable of holding 300 tons of white roll paper. The electric plant, with an energy of 2500 incandescent lamps, will be in the vault under the sidewalk. The boiler room, with 1000 horse-power capacity, is on the bridge side, but located at the bottom of the light well, and entirely outside of the walls of the building.

Six elevators will carry the occupants to the upper stories. Two will go to the thirteenth story, and will be exclusively for the compositors. One elevator, for the editorial staff, will run to the eighteenth story. The other three elevators will be for the use of the occupants of the offices.

The walls on Park Row and Frankfort Street are of red Corsehill Scotch sandstone, with buff terra cotta and polished granite ornamentation. The sandstone rests upon a basement of rock-faced Quincy granite. The entrance arch, 78 feet high to the key and with a noble span of 30 feet, is very impressive. The main front will rise nearly two hundred feet from the curb to the parapet on the thirteenth story. The domed tower rises five stories higher.

The *World* is the oldest Democratic newspaper in New York. Its history reaches back of its present name, for it is the outcome of a variety of ventures and experiments, some of which were moderately successful, one or two of which were brilliant, but all of which were absolutely revolutionized when, on May 10, 1883, Mr. Joseph Pulitzer bought the stock of the Press Publishing Company (the title of the corporation which publishes the *World*), and assumed the management of the paper.

The newspaper on whose foundation the *World* rests was established in 1818. It was named the *National Advocate*, and its editor was Mr. Henry Wheaton. It was Democratic at a time when the Democracy were supporting the war with Great Britain against the strenuous opposition of New England. In 1826 Major M. M. Noah bought the *National Advocate*, and changed its name to the *Enquirer*. Then, years afterward, the paper passed under the control of General James Watson Webb, and was consolidated with the *Morning Courier*. For thirty-two years the New York *Courier and Enquirer* was the leading Democratic organ of the city, and then its Associated Press franchise was bought by the company of gentlemen who established the *World*.

It was in 1860, on June 14th, that the *World* first appeared. It was distinctively a religious newspaper. A year afterward, in July, 1861, the *World* bought the Associated Press privileges of the *Courier and Enquirer*, and a year after that, in 1862—it having been discovered that a religious daily newspaper could not be made successful, at least in the stirring times of war—the paper was sold to a company of distinguished Democrats, chief among whom were Mr. August Belmont and Mr. S. L. M. Barlow. Mr. Manton Marble became the editor-in-chief, and under his management the *World* was a brilliant, vigorous, and influential organ of the party. On December 29, 1869, Mr. Marble became its sole proprietor, paying $100,000 for the one-fourth interest which he did not own before. For seven years Mr. Marble continued to publish and edit the newspaper, and then sold it to a syndicate of capitalists, who were represented by Mr. William Henry Hurlbert, who organized the Press Publishing Company; all the stock of which, as has already been stated, was purchased by Mr. Pulitzer, May 10, 1883.

When Mr. Pulitzer came into possession of the property the fortunes of the newspaper were at a very low ebb. Its average circulation was about 15,000, and its advertising business was inconsiderable.

In his announcement of his purchase of the "entire *World* newspaper property," in the issue of May 11, 1883, Mr. Pulitzer stated his absolute antagonism to the policy of his predecessor; he proclaimed that the paper "from this day on" would be "under different management—different in men, measures, and methods; different in purpose, policy, and principle; different in objects and interest; different in sympathies and convictions; different in head and heart." It was announced that thenceforth the *World* would do battle for the people, and against "all fraud and sham," "public evils and abuses."

What kind of a newspaper Mr. Pulitzer has made of the *World* is familiar knowledge to a vast number of people who dwell in the city of New York and elsewhere. No newspaper has had such an extensive circulation on this or the other side of the water as is claimed for the *World*, and there is a standing advertisement at the head of the editorial columns which states that the circulation books are always open for the inspection of the public.

The policy of the *World* under Mr. Pulitzer's management has been to print an enormous quantity of news, especially of the kind in which there is the most popular interest. It has followed with an eager quest all the complaints of hardships made by the people who have fewest friends. It takes the side of the man who is unjustly accused by those in authority. It assails, with an energy and vigor that are strange to the calm philosophy of most of the newspaper offices of the metropolis, the popular outcries against the "outrages of corporations," the "encroachments of plutocrats on the rights of the people," the "idleness of public servants." It is the friend of the immigrant and the enemy of the Castle Garden system. It has penetrated the mining regions of Pennsylvania, and described what are known in that region as "pluck me" stores. It took a leading part in the war on the "boodle" aldermen. Its boast is that it is always engaged in a war upon vice, public and private, that in this warfare it knows neither party nor friends. It storms against the public thief and the private enemy of virtuous society.

It has not been always a partisan newspaper, for it has more than once opposed the election of Democratic candidates. Its latest conspicuous struggle against the nominee of its party was the war that it made in favor of Mr. De Lancey Nicoll and against Colonel Fellows for the District-Attorneyship of New York. In its principles it is Democratic, but it is sufficiently independent of its party to fight its candidates if it does not consider them worthy to hold public trust. Its democracy, in the largest sense of the word, is more extreme than has been ever expressed or held by a New York daily newspaper of any prominence. It is against royalty and nobility everywhere, and as soon as the birth of a republic is announced, it insists with all its vigor that the new government shall be recognized by the United States. It accepts the shibboleths of the Democratic party. It is for low tariff taxes, for civil service and ballot reform, for economy and simplicity. It does not advocate its belief in long arguments, but states them in short editorials. From one end of it to the other the *World* is made for the many, and is usually to be found against the few. And this is a virtue or a vice, according as one belongs to the many or the few.

Perhaps the *World's* local enterprise which attracted most attention in New York in its time was its raising the funds for building the pedestal of the Statue of Liberty. It ought to be stated that Mr. Pulitzer justly regards with most pride the public services which he renders with his newspaper; but the collection of the fund, which had languished for a long time, was a most striking achievement. The *World* took up the work, which had been practically dropped by those to whom it had been intrusted, and in five months raised the needed $100,000.

The corner-stone of the new building was laid on the 10th of October, 1889. The prayer was said by Bishop Daniel S. Tuttle, of the Diocese of Missouri, in place of Bishop Potter, whose duties at the National Convention of his Church prevented him from being present. John A. Cockerill, Mr. Pulitzer's representative, introduced the Hon. Chauncey M. Depew, who was the orator of the day. A speech was made by Governor Hill, and a cable despatch from Mr. Pulitzer was read. The four-year-old son of Mr. Pulitzer laid the corner-stone, in which were placed, among the copies of the addresses mentioned and other things, two phonographic cylinders and one graphophone cylinder containing sentiments of the *World* staff. There were letters and telegrams of regret from ex-President Cleveland and other distinguished persons.

The *Evening World* was established in October, 1887, and its success has been more rapid even than that of the morning edition.

MADAME LILLI LEHMANN-KALISCH.

Editor: If the feeling of disappointment with the present and extravagant estimate of the past were not a note that has always been heard in criticism, the people of to-day might find it difficult to persuade themselves, in the face of much writing, that they have ever been privileged to hear a really great singer. Talk with the memory-mongers of the palmy days of Castle Garden and the Astor Place Opera-house, and you will learn that the art of singing died with the sweet-throated persons who burdened the air of those places with melody. But you will not learn that the older people of that halcyon day thought these stars pale and lifeless orbs compared with the luminaries of their youth. Yet this is the way of the world, and has been ever since humanity began to dream of the golden age that is past. In the nature of things personal equation must enter into judgment on the merits of singers. Memory alone perpetuates their achievements, and there is an age in every memory which is gilded by a thousand lovely associations that mock the exercise of simple æsthetic judgment. Analysis can determine and the record preserve the range of a singer's voice, and give a hint of its flexibility and other artificial attributes, but the vital charm of the singer's art eludes analysis and defies recording. A critic in the performance of his duties is compelled to meet with much bad art; but when a respectable entertainment offers nothing to delight him, he would better look to his stomach or his liver. By the same token, when our venerable friends of to-day bewail the fact that song fled this earth when Jenny Lind retired or Sontag died, it is not wholly out of place for one of this generation to inquire, "How old were you when you heard your charmer, and who was

'The fair, the chaste, the unexpressive she'

who occupied the adjoining stall?"

There are a good many persons who think that the Metropolitan Opera-house is now giving artistic domicile not only to the finest dramatic singer alive, but to one who is in very truth a great singer. Of course they mean Madame Lilli Lehmann-Kalisch. Interpreting the adjective in their definition in harmony with the spirit of the tenth decade of the nineteenth century, they might easily establish their contention. Madame Lehmann-Kalisch is not the greatest vocalist or the most sympathetic singer on the stage to-day, but if she has a superior as an acting singer or a singing actor, the fact is not known to the people of New York at least. She is wellnigh matchless in voice and training, quite unique in earnestness and devotion, but her chief significance grows out of the union in her art of the old conceptions of vocalization and the newer conceptions of the province of singing on the operatic stage. She exemplifies the true purpose of music in the lyric drama, which is to intensify the expressive capacity of the text, to supply the emotional element which the spoken word lacks. But while, in harmony with this purpose, she yields to the text all its privileges, she preserves to the music all its rights. Her art, subject as it must be to natural limitations, is a little lacking in notes of womanly tenderness. Sentimentality is utterly foreign to her nature; in place of it she has large sentiment and grandiose passion. For such a character as Elsa she could have no sympathy; but she would delight in publishing the demoniac power of Ortrud. As the wronged Brünnhilde in *Die Götterdämmerung* she is a consuming fire; from the moment she discovers Siegfried's treachery she pervades the tragedy as that devouring element does the final scene of *Die Walküre*; as the loving [illegible] the Valkyrie, transformed into loving woman and brought face to face with the object of her love, she is unreasoning, self-forgetful passion incarnate.

It is a proud reflection that Madame Lehmann-Kalisch developed her full artistic stature in New York. In Germany she was only known as a singer of the florid type, and she had [illegible] to wrench herself away from the Court Theatre in Berlin, in order to emancipate herself from its conventions, and enter into the estate for which nature designed her, and toward which her own lofty conception of the dignity of art directed her. "After one has sung princesses for twenty years, one gets weary," said she, when justifying her secession from the Berlin Court Theatre. She had sung there fifteen years, and had held the appointment of court singer for ten years. Before then she had been employed in Dantzic and Leipsic, and had participated in the first representations of Wagner's *Ring des Nibelungen* at the Bayreuth Festival of 1876. She was born in Würzburg, and is a child of the theatre, her father being a tenor, her mother the dramatic soprano, Marie Loew, in early life prima donna at Cassel, and afterward harpist at the opera in Prague. With her sister Marie, now at the Vienna opera, she was educated by her mother, of whose abilities she justly speaks with great admiration. She has been the principal soprano at the Metropolitan Opera-house since the fall of 1885, and is now at the zenith of her powers.

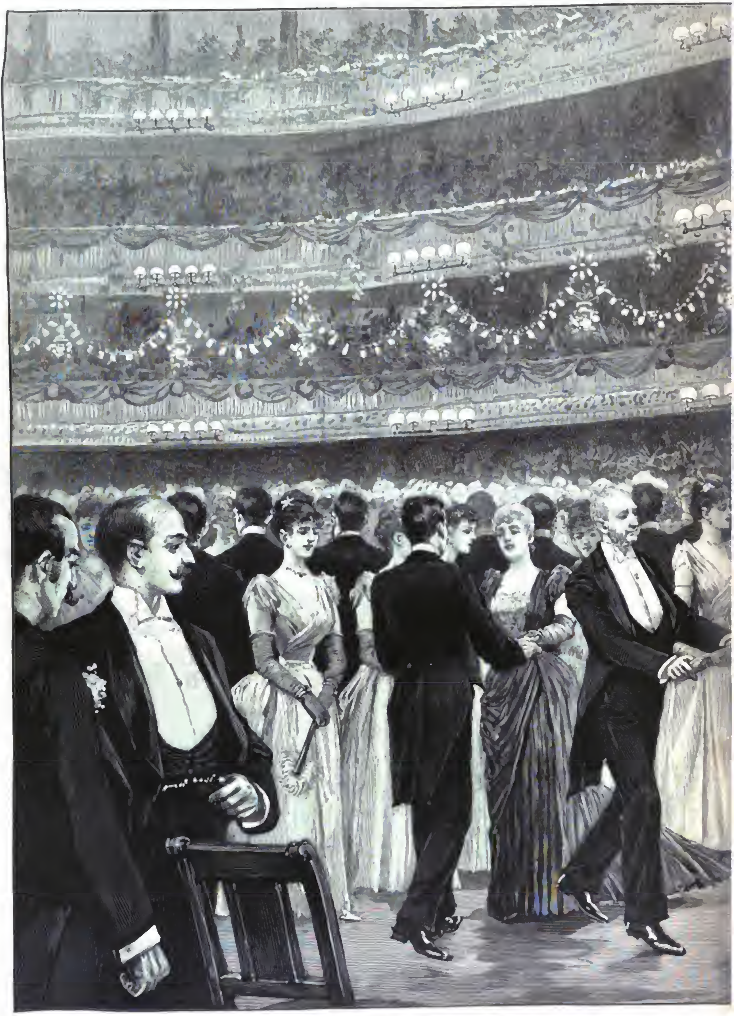
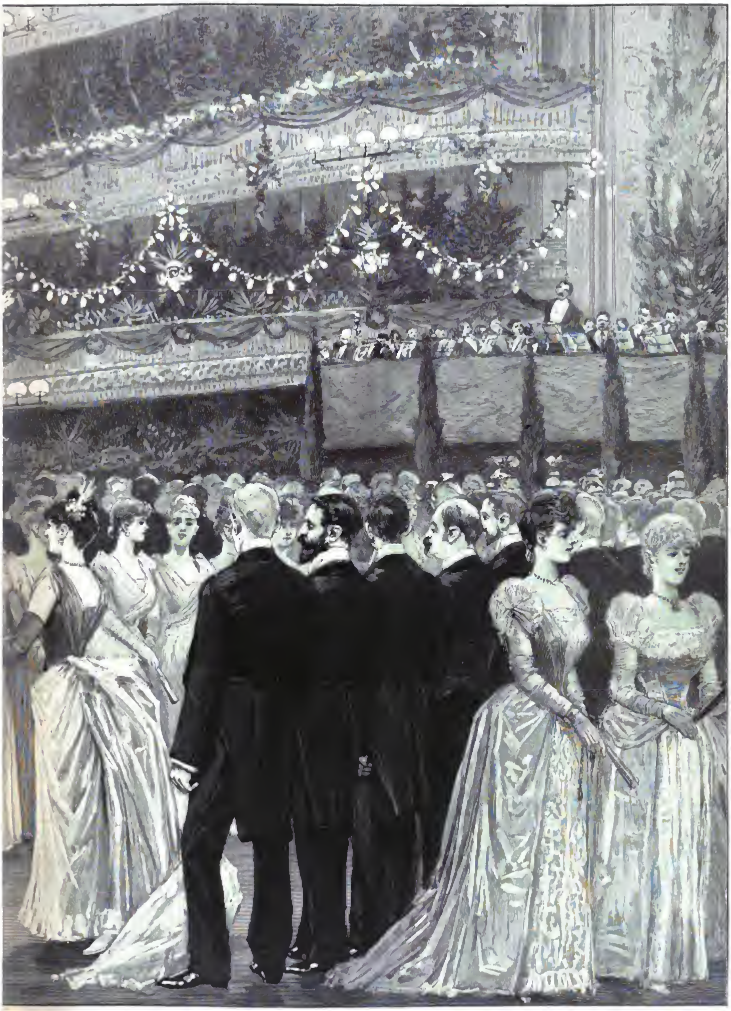
MR. MULPHENY. "Good-marnin', sor; an' how [illegible]"
HAYSEED. "It's a good ways. Who do you want to see there?"
MR. MULPHENY. "Sure it's myself I want to see there."



THE SIR ROGER DE COVERLEY (*QUADRILLE D'HONNEUR*) AT THE NEW-YEAR'S



ALL IN THE METROPOLITAN OPERA-HOUSE.—Drawn by T. de Thulstrup.—[See Page 51.]

THE NOMINATION.

BY LYNN R. MEEKINS

Abner Green and his good wife Jane were sitting in the easy-chairs, resting after the day's work. He had closed his store at nine o'clock. It was a little cool for September, and the windows were down. The light was turned low, because Abner and Jane were economical, even in the matter of coal-oil. They seemed satisfied with life. They had the contentment that waits on good appetites and well-employed energy. Indeed, they had gotten along unexpectedly well since the quiet marriage ceremony of eight years before. Both being practical souls, no such useless expense of time and money as a wedding tour had entered their thoughts. After the parson said his prayer, they marched out of the church and went direct to the small store that Abner had started two years before. They gradually extended that store, saving the pennies and investing the dollars, and putting over their heads a large financial umbrella for rainy days.

Abner was a born success. People always said he would get along. On days when other boys were off gunning and playing, he was contriving and working and saving. His Saturday holidays were turned to strict account. By the time he was seventeen he had the business weight of a man in the neighborhood. His wisdom ran ahead of his years.

When he was eighteen he determined to inaugurate an enterprise. Sussex District (or rather the Second District of Choptank County) was probably the only territory of its size that did not have a good country store. The people did their dealing in the town, eight miles away. At the point near the saw-mill where three roads met, an old residence stood. It was vacant. Abner rented it, and surprised the neighbors by turning it into a store. He got a stock of goods and began business. At first the returns were slow, but Abner was content with small profits, and the customers gradually saw that it was fully as cheap to patronize him as it was to drive to town over indifferent roads, and a great deal more convenient. Moreover, Abner quickly gained a good reputation. He was looked upon as shrewd but just—the strongest kind of fame in a rural community. So he went along, saying little, offending no one, and attending strictly to trade. Two years showed him what he could do, and told him that he needed a wife. Like a good business man, he did not postpone a necessity. He looked around, and found a girl of strong practical sense and fine physical health, not much for beauty or brilliancy, but a great hand in the house and a general favorite with the people. Inside of a month they were married, and everybody said it was a good match. Eight years had endorsed that verdict. They had worked and prospered.

Abner, as he sat in the big rocker, was a man with a good quiet face and a rugged frame. He had quick eyes, which looked at things cautiously but shrewdly, a somewhat didactic tongue that was used for business and operated by discretion. His best confidences seemed to be his second thoughts.

"Abner," said Jane, "what is this talk about you and the sheriff's office?"

He looked up quickly and shifted his position before replying. "Where did you hear that nonsense?" he asked.

"All the folks are talking about it. I heard some men discussing it while you were out of the store to-day, and saying that Colonel Short had been to see you about it. The people seem to think you'll make a mighty good man for the place."

Abner smiled in a sober kind of way, and nursed his knees with his two hands. Presently he looked up, and said: "Jane, a man of convictions should take an interest in politics for the good of the party which represents his principles, and not for any ambition which merely represents his own pride. I have voted the ticket and done some work for it, not with the hope of any office, but because my conscience and my judgment dictated that course. If people misconstrue my motives, it is very wrong."

"But, Abner, if they should give you the office—"

"Yes, if they should give me an office, what then? Four years of business, and afterward a return home to find our business all gone, or taken up by some one else. No, Jane; you and I have had too hard a time building up this trade to have it ruined by politics. Let us keep on in our course, for we know not what a change might bring forth."

Jane was silent for a while. The mention of the possible honor had aroused a quiet but unexpressed ambition for town life, had suggested the possibilities of some of that change which every woman from Eve down has always secretly longed for. But Abner's practical words had brought out her common-sense, and shoved the ambition back into the closet of her heart. She closed the door upon it and sighed.

"I guess you're right. You 'most always are. But who do you think they'll take in your place?"

"I am for Major Powderdry," said Abner, with considerable emphasis.

Mrs. Green was greatly astonished. "Major Powderdry!" she exclaimed. "Why, goodness gracious, Abner! he hasn't done a thing in his life except to run for office and run into debt."

"That's just it, Jane. The good Lord has laid out for us certain duties in this world. A man may sometimes get away from his path, and wander over the field; but he always has a kind of an idea of what he is living for, and he is pretty apt to hit the road while he is tramping around. Now Major Powderdry's business is running for office. It don't pay much, but he sticks to it. Mine is running a store. I've got along all right in the store, because the people have encouraged me. Now what the major wants is more encouragement. So let him have it, I say, and let us all elect him. Then, too—but of course you needn't mention it—if he gets through, he may pay us that little bill he owes us."

"Well, Abner, you certainly look at things with both eyes," said Jane, with a decision that had in it a small undertone of admiration.

"Of course I do, Jane; and when they fail to see what's what, I know two other eyes that are mighty pert about finding the right side."

Jane smiled, and felt quite happy. It wasn't often that they paid each other such compliments.

"Jane," said Abner, after a pause, "if the folks talk any more to you about me, just say that Abner is too busy attending to the store to go running across the whole county for an office, and that he votes the ticket for his convictions and not for rewards, and that he has said that Major Powderdry would make a good man for the place. Don't go out of your way to say this, but if anybody makes you talk, why, just put it to 'em straight and earnest like; and if you want to, you might add something about your not caring for me to give up a good business for any such foolishness, and so forth and so forth."

Jane said she would, and as ten o'clock had arrived, they took up the lamp, locked up the house, and went to bed. But before going to sleep Abner added, "And, Jane, you might say that the talk me and Colonel Short had was on private business."

It did not require an age for anything to get over the district. News was so scarce in Sussex that it had the volatility of hydrogen with the combined expanding qualities of all the known gases. Somebody had mentioned Abner Green's name for the shrievalty. It met with favor. It was time the district was getting the office. Abner was a good party man, a reliable conservative citizen, and a neighbor who was popular. The people talked quietly at first, but after it was known that Abner and Colonel Short had had a long talk, the discussion took a wider range. As it became more public it aroused a factional opposition, led by the voluble and contested Major Powderdry, a talkative upholder of party principles and an inveterate seeker for a place on the ticket. Abner Green said nothing, and attended to business.

The next day after their little talk Jane left Abner at the store, and made a few visits. The matter of the office came up for discussion everywhere she went. She was not slow in making prompt and decidedly emphatic comments.

"Yes," said she, "I have heard that they are talking about Abner; but I reckon it's a lot of breath wasted. He's been a-working going on ten years building up his store, and he ain't such a goose as to throw away his business for an office. That talk he had with Colonel Short was about a private matter. There ain't much money in politics; and as for our part, we'd rather have what we got than go to trying a change. Abner don't vote the ticket expecting to be paid for it; he's not that kind. As far as I'm concerned, I'm glad of it, for it's not everywhere that you can get good neighbors. What's more, Abner's looked upon as a good man now, while if he was to go into politics, goodness only knows what they'd say against him. And Abner ain't one that takes such things easy. He told me no later than last night that he was in favor of Major Powderdry. 'If our district is to have it,' said he, 'why give it to Major Powderdry.'"

The good wives that good wife Jane talked to in the afternoon told it to their good husbands at supper, and before bedtime it was generally known that Abner Green was for Major Powderdry.

The major heard it with incredulity at first, and then with joy. He knew that Abner Green's endorsement would have great weight with the people. "I have always liked Abner," he said. "He is a man of business, a man of honor, and a great credit to this neighborhood. I have watched him since he was a boy, and each year has increased my good opinion of him. When the people talked about his name I opposed it, because I knew that it would only bother him."

The major talked in this strain so as to ease his conscience and convince himself of what he never believed. That was a peculiarity of his oratory as well as of his conversation. He could talk himself into any belief, while the cold and listless crowd stood by and doubted.

The next day, arrayed in dignity, he dropped in at the cross-roads store. He found Mr. Green in an unemployed interval, and took possession of the opportunity with voluble but diplomatic promptness. He complimented the weather, the store, and Abner, and asked, with solicitous earnestness, for the health of Mrs. Green, and then he plunged boldly into the purpose of his call.

"I hear," said he, lowering his voice, "that you have stated that you will endorse me for sheriff."

Abner took it in a matter-of-fact way, although he secretly enjoyed the major's polite circumlocution.

"Yes, major," he said, with business bluntness. "I'm for you. You ought to have it. This district ought to have it. And the way for us to get it is to get it."

This aroused the major's oratory. "Well said, Mr. Green—nobly said. In the distribution of the legitimate rewards of the party, the just and equitable deserts of noble old Sussex have not been recognized. It will be a proud privilege for me to lead in the demand for this recognition, and I ask you, sir, that you will allow your name to be used on the delegation to the convention—as the head of that delegation, sir?"

The major said this with great personal applause, and Abner seemed very much impressed by it. The merchant was doubtful. He rubbed his chin in a meditative way, and took some time to respond.

"Now, major, I want to keep out of politics."

"Do not say that, Mr. Green. Retract it in thought and purpose. It is upon such men as you—upon the yeomanry of the party, if I may say so—that the selection of good standard-bearers and the perpetuity of free institutions must depend. You owe it to your district, sir, to be a member of that convention."

Abner paused again; he paused so long that the major walked back and forth in great uneasiness.

"Well, since you put it in that way, of course I guess I'll have to think about it," said the dry-goods Sphynx at last. "But arrange it as quietly as you can."

A light of joy burst upon the soul and illuminated the face of Major Powderdry. He grasped Mr. Green's hand and thanked him, not once, but countless times. Presently the emotional equilibrium was restored, and Abner told the major that the next day he was going to start through the county on a business trip. He had the agency for a new machine, and he had been directed to place its sale in different stores of that territory. "I'll see how things look in politics," he said, "and put in as many good words for you as I can."

The major's generosity sprinkled itself out again, but the interview was brought to an end by the entrance of a family party in search of shoes and molasses. Major Powderdry went home with a happy heart. He was already beginning to enjoy the office and its perquisites—the perquisites mainly.

Mr. Green's business trip occupied three days. He enjoyed it. Being well known and well esteemed, it was agreeable to meet people and talk with them. Moreover, he sold more machines than he expected. By the time he arrived home the delegation had been agreed upon, and he had been placed at the head of it by the unanimous desire of his colleagues.

He reached the store just before twilight, and he had scarcely finished his supper before Major Hamilton Powderdry called. The major was more than anxious to hear the results of the journey.

"I am glad to see you back, Mr. Green—very glad; and I hope you are the messenger of good news."

"Well, yes, major; I did remarkably well with the machines; a great deal better than I expected."

"I congratulate you, sir—I congratulate you most sincerely. How did you find the political complexion? Was it favorable?"

"Oh, politics? Oh yes! So I remember. Of course, major, I was mainly on business, but in the demands of that business I did not forget you. I did not forget our district."

The major rubbed his hands and smiled, in anticipation of glad tidings. "Thank you, Mr. Green—thank you. What—what did you hear?"

"Well, I guess I better give you an itemized account—a bill of particulars, so to speak."

The major was greatly pleased.

"First, I went to Forktown. I found that they are going to send a solid delegation down for Boggs. They were quite earnest about it; said that their district ought to have the nomination, and that Colonel Short had half promised it to them, and that they were going in to win. Of course it wasn't much use to talk against such feeling as that, although I did tell them that in Major Powderdry, Sussex had a candidate that she was proud of."

"Thank you, Mr. Green—thank you. We'll soon down Boggs. Their talk about Short's support is nothing but a bluff. How about Bethel?"

"Well, Bethel's got the fever too. They say they hain't had the sheriff for twenty years, and that they are going to pull for it this time, or break the traces. They're putting up young Jones, and he's working like a beaver. I slipped in a few words for you, major, but they brought up the argument that Sussex had it sixteen years ago, while it's been twenty years since it went to Bethel."

The major uncrossed his legs and nodded his head. "That's all right," said he. "I know Jones. He's active, but that's all. We'll circumvent him."

"From Bethel I went on down to Drawbridge and Forks. They are not far apart, you know. I found out that they had nobody in particular that they wanted, but Jones had sent down some missionaries and captured Drawbridge, and Boggs men were at work at Forks. There is where I did some talking. I told them of our demands, of our candidate, of you, major, and your long service to the party. I said: 'Gentlemen, here is a fine man and an esteemed citizen, who has sacrificed time and effort in campaign work, who has fought in the front ranks, who has never flagged or proven recreant to his duty. He is the man we offer you, and we ask that you help us to nominate him.'"

"Thank you—thank you! Did you convince them of the wisdom of that course?"

"Not quite. They wouldn't commit themselves. So, to keep them from going to Boggs or Jones, I persuaded them to put up their own candidate. 'If it's to be a grab game,' I said, 'why don't you take a hand?' Then I left, and went on down to the lower districts, where they don't care who gets the nomination, for the good and sufficient reason that they have had it for the last three times. However, I came back by Drawbridge and Forks to-day, and I found that they had put up their men—Hanson for Drawbridge and Withers for Forks."

The major's bright face seemed clouded. "Do you think," he asked, "that it was wise to bring two more men into the field? Won't it complicate matters?"

"Well, major, I'm a business man, and I look at it in a business way. I argued that if those two districts were disposed to go against us, the best way would be to make them fight each other as well as ourselves. It takes them away from Boggs and Jones. Now we have eight districts, and no nomination can be made until one of the five breaks to some other candidate. You stand well, major, and your genius must make a successful combination and win. You can do it, can't you?"

When the major saw it in that light he was radiant. "Why, Abner," he exclaimed, growing more familiar, "you are a Napoleon of politics. It's a great arrangement. I know Hanson and I know Withers. I'll see them; I'll deal with them; and when the convention opens, we'll give Boggs and Jones the biggest surprise party they ever saw."

This was Saturday. The convention met on the following Tuesday. The interval was fully employed. Everybody talked politics. The major led. He was exhaustless. Hope beamed on his smiling countenance like sunshine on a morning-glory.

"Well, I never saw such a sight in all my born days," said Mrs. Green. "The major acts as if he'd been elected and got all the offices in the State."

"Yes," said Abner, "the major is enthusiastic. He has a sanguine temperament."

"He used to talk against you so. Now he's praising you to the skies. There ain't any word too high or too big for you. It's a strange thing, this politics."

"Very strange—very strange," replied Abner, nodding his head. "It shows the changeableness of human nature, Jane; the instability of character. If I had run for this office in an open way, as the folks wanted me to, the major would have been going around abusing me and getting up his movements against me, and I guess he'd come near downing me. But now I am one of his delegates, and he is as sweet as a hogshead of molasses. How much better it is, Jane, to have the friendship of everybody, even though we have to put ambition aside!"

The delegates from Sussex met at the cross-roads and started to town bright and early. Abner accepted his importance as the head member of the delegation modestly. Major Powderdry was gorgeous in a new high hat and an enlarged vocabulary.

"Now, Abner," he said, with confidential earnestness, "you hold the delegates solid. I'm an old hand at this business, you know, and if you stick together while I do the work and pull the wires, we'll win as sure as the sun will shine."

"That's it, major," he answered. "We'll depend on you. I was never in a convention but twice before, you know, and both times they had the ticket made out, and all we had to do was to vote it through. This business is a little new to us, and I guess it 'll be a heap more exciting. Just let me say one word: don't let 'em bully you. Stick right up to it, and stay in the field as long as you can."

This warning aroused the major's latent pugnacity. "Abner," he said, "I'm in this fight to win, and I'll stay at the front till the battle is over and the cows come home."

So, with discussion and warning and advice and suggestion, the delegates proceeded. The temperature of their determination rose steadily, and by the time they reached town they were ready to march into the convention and demand the nomination for sheriff as the right of Sussex District.

But they ran into other determined bands. With the other four candidates in the field the situation was lively. The advocates of each man were importunate and vociferous. Into the arena the statesmen from Sussex, led by the intrepid Powderdry, advanced with argument and inquiry.

The Choptank County court-house, where the convention met, was a sombre building of brick, fronted by a large square. Out-doors and in-doors the groups were discussing and canvassing. Opposite the square was the law office of Colonel Short. To and from that place flowed a steady stream of delegates. Colonel Short was the county leader—the "boss." Some came from that office in smiles, some in frowns, and some so much in doubt that their expressions were untranslatable.

Abner was button-holing a man from a lower district, and was putting in a word for Powderdry and a word for his machines, when some one touched him on the shoulder. It was the major.

"I've been to see Short," whispered he. "I talked plainly to him, as a man with my strength should. I told him I had the united support of Sussex District, and that our district was entitled to the nomination. 'You're probably right, major,' said he; 'but there are four other gentlemen from four other districts who say the same thing, and I don't see how we're going to settle it except by fighting it out. Whoever wins, we'll get a good sheriff, and I wish you luck!' Now, Abner, what is there in that? It looks stormy. Do you think we'll get through?"

"Well, major, we're doing all we can, and trusting to you to uphold the rights of our district."

The major's backbone stiffened, and he proceeded a second time to work. He saw everybody, made a hundred indefinite promises, and attempted every coalition that a man of twenty-five years of political failure could invent.

He was still at it when the hour for the assembling of the convention arrived. The delegates were in their seats, too much impressed by their importance to say much. The crowds struggled in and filled the benches of the court-room. A buzz of speculation and expectation arose to the ceiling and resounded between the walls. Occasionally a laugh interrupted the monotonous hum, or a pompous citizen came in, and talked loud enough to make himself heard above the noise.

A clapping of hands and a few thuds of heavy boots on the floor announce the approach of the chairman of the County Committee. He mounted the rostrum, bows, calls the body to order, and says a few words which result in more clapping of hands and more boot thuds. With one or two soaring exploits in oratory, the election of the officers of the convention, the appointment of the committees, and the necessary preliminaries are arranged.

There is a recess for dinner. The interval is a time of heroic effort on the part of Major Powderdry and his competitors; but the more they have worked the greater has their doubt grown.

"Abner," whispers the major again, rather more agitated than before, "I'm afraid it's a case of every man standing pat, and staying in till the light goes out."

Abner does not exactly grasp the simile, but he tells the major to remain firm.

The session opens. There are more speeches and more enthusiasm, and then the real work begins. There is not much hitch over the first nominations, but when the sheriff is reached a general movement seizes the delegates and the on-lookers. They expect something worth seeing. But just as they get fixed for the excitement, a delegate arises and moves that the nomination for sheriff be postponed until the rest of the ticket is agreed upon. This causes a little fight, but it ends in the desired postponement.

In an hour's time the ticket is complete with the exception of the sheriff. That contest opens with great earnestness. For the purpose of saving time the nomination speeches are brief and formal.

The voting begins. Five districts have their candidates. The three other districts distribute their votes with impartial favor. Ballot after ballot is cast without an approach to a result. The feeling becomes intensified. Two hours go by, and still there is no nomination. The districts are sticking to their men, and a nomination is impossible unless one of them breaks. Supper-time draws near. Some delegates begin to get hungry. All want to go home. But their earnestness triumphs over appetite. A new ballot discloses no change. Major Powderdry's hopefulness is oozing out, but he sticks like grim death. Suddenly some one whispers in his ear, "Major, Colonel Short wants to see you in the jury-room."

A great hope surges through the major's soul, and he tiptoes to the door, and in a minute he is in the presence of the party dictator.

"Major," says the colonel, "what are you going to do?"

"Stick!" he answers.

"Listen to me a minute. We've got a good ticket, and we've got a tough fight ahead. You five men in there are getting so hot against one another that not one of you can possibly win. You can't. They can't. Now why not name the man."

"Who?"

"Who is your choice?"

"Abner Green would be a good man, but—"

"Well?"

"He won't take it."

"Get him out of the room, and give us time to nominate him, and he'll have to take it."

The major sees the situation. He pauses. He considers. He could not be nominated; why not nominate? He could not be Edmond, why not Warwick? Colonel Short argues. The major decides. He will do it. Rushing to the court-room, he gets Abner Green, and brings him to Short. Then telling him to stay there till called, he rushes back. Everybody leaves the jury-room to watch the convention, except Short and Green. At the farthest window they whisper earnestly.

A new ballot is about to begin, when, at the request of Major Powderdry, one of Colonel Short's smartest lieutenants—young Carr, from a lower district—arises and asks permission to say a word. There is some grumbling, but a vociferous aye yields him the privilege. He mounts the platform:

"*Mr. Chairman and Gentlemen,*—We are going to win. [Applause.] We have got a good ticket. [Applause.] Harmony is thick and beautiful around here. [Smiles.] The only discordant note is a little difference of opinion about the sheriff. [Laughter.] We are burdened with five good men, embarrassed with riches. My fellow delegates from this district and myself have voted for every one of them on the various ballots, and to save our lives we can't say which is the best man. [Applause and laughter.] We'd like to nominate you all. [More laughter.] But it would be like putting too much sauce on the apple-dumpling; it would make the ticket too rich. [More laughter and applause.] Now I want to get home some time to-night; so do you. We want to leave with the knowledge that we have done our work. We don't want to carry away any hard feelings. It is for that purpose that I arise here on behalf of several districts, including our own, to suggest a name that will be endorsed by every man in this convention, by the whole county, that will add strength to the ticket and give enthusiasm to the party. I can pay this name no higher tribute than to say that it is the peer of the gentlemen who are now before this convention. [Applause.] In the interest of harmony, in the assurance of victory, and in the hope of getting my supper before breakfast, I nominate Abner Green, of Sussex District."

The surprise is complete. The applause begins slowly; then it takes a jump; and finally it sweeps through the room, and carries everything before it. It gains momentum when it is whispered around that Abner has been purposely gotten out of the room. Major Powderdry leads in the enthusiasm. The nomination is quickly seconded. A ballot begins. Before it is half taken, the nomination is made. A great howl goes up.

In the jury-room Colonel Short looks at Abner, and remarks, "It seems to be all right."

As Abner smiles in reply, the door is burst open, and in rushes Major Powderdry, his face beatified with unanimous joy, his arms pointed in ecstatic gesture, his coat tails flying with nervous enthusiasm, and his whole being full of the bliss of victory—for his district.

He takes Abner, drags him before the convention, and shouts, "Hurrah for Sussex and our next sheriff!"

As the cheers go up, Abner asks what it all means. He is the idealization of innocent astonishment. The delegates seem to enjoy it.

And so does Colonel Short, who is standing in the jury-room door and looking smilingly on. He is thinking of the possible future in politics for a man of Abner Green's tact and scheming.

It was late when Mr. Green reached home, but Jane was patiently waiting for him. The news dazed her, and he did the talking.

"Now don't say a word about it, my dear. It's the best-paying office in the county. The people think it's been shoved on me. Let them think so. Colonel Short and me won't deny it. Oh yes; you are asking why I didn't tell you all about it. Well, my dear, running a store and running politics are two different things. If you want anything in the store, the best way to get it is to ask for it. If you want anything in politics, the best way to get it is to get it without asking for it. And, moreover, my dear, a truthful woman like you is never safe in politics, unless she don't know what she is talking about."

THE NEW-YEAR'S BALL AND MR. McALLISTER.

The New-Year's Ball held at the Metropolitan Opera-house on the night of January 2d was described the next morning in the newspapers with notable unanimity as the most brilliant and successful social event in the history of New York city. Though the reportorial mind is often affected by the glamour of a present splendor, and unable to make due allowance for perspective, in this case it seems to have stated no more than the fact.

The inspirer and manager of the great occasion, Mr. Ward McAllister, as he contemplated the fruit of his genius and labors, could not but regard it as the proudest achievement of his life. There is an inscription to Sir Christopher Wren, carved on the stone in the interior of St. Paul's, containing the words, "*Si monumentum quæris circumspice*" (if you seek his monument, look around). If any one at the ball were disposed to dispute Mr. McAllister's claim to greatness, a similar suggestion would have silenced him. The foundations for such a success as this New-Year's Ball must be laid broad and deep, and the superstructure reared with constant watchfulness and care. Hundreds of matters which would escape the attention of an ordinary understanding must be considered and provided for. It requires a master-mind to grasp the scheme in all its extent and complexity, and carry it forward unfailingly to the end.

But this ball had a deeper significance than appeared upon the surface. Several things were to be set right by it. One of these was the erroneous impression that lingered in some minds to the effect that New York "society" comprised only about four hundred people. Mr. McAllister suffered under the imputation of having established this narrow limit, and the best way in which he could free himself from the responsibility therefore was to practically demonstrate the real truth of the situation.

Another thing to be established by the event was the pre-eminent capacity of Mr. McAllister as a ball manager. When the Centennial festivities were being conducted in this city last spring, it will be remembered he was relieved of the important duties he had been charged with, and their performance assigned to others. He smarted under the sense of injustice done, but nobly bided his time, and now his reputation is vindicated in a thorough and gratifying manner. Nearly twelve hundred individuals, truly representative of the wealth and fashion of the metropolis, were gathered together on the recent occasion. The stage and auditorium of the opera-house were decorated with evergreens, wreaths, and flowers, with a fairly enchanting effect. The boxes were ornamentally closed, and nearly every one was kept upon the floor. A double-page representation of the scene when the Sir Roger de Coverley *quadrille d'honneur* was in progress is published in the present issue of the Weekly. The supper and every detail were carefully attended to.

The presumption now is that the New-Year's Ball will become a regular institution, and annually place New York "society" symmetrically and satisfactorily before the world, which, it appears, no other social event adequately does. The tact and judgment exercised in the present instance in placing the tickets in the manner desired caused no heart-burnings or complaints. Mr. McAllister selected one hundred and forty-four gentlemen of unquestionable standing as subscribers, and each of these selected, in turn, his own quota of guests. The result, with respect to the company assembled, was entirely fortunate. Those interested placed themselves cordially and unreservedly under the control of their able director, and none questioned his supremacy. Have we here a foreshadowing of what is to become an established order of things, and that some shape and definiteness are to be given to that elastic and unorganized thing known as New York "society"?

There is no question that a properly managed ball is the most highly evolved form of human festivity. There, if anywhere, beauty, adornment, and pleasure-giving agencies are made to count for all that there is in them. Fame, as well as gratitude, is due to the man who can marshal and control all the forces involved, and whose rare abilities enable him to add in this way to the sum of earthly delights. If Mr. McAllister should die in the midst of the career he evidently has marked out for himself, it might be said of him, as Johnson said of Garrick, "his death eclipsed the gayety of nations, and impoverished the stock of harmless pleasures." The individuals who have gained historic renown in the particular path of glory trod by Mr. McAllister are few. Richard Nash, of Bath, who flourished some two hundred years ago, is his most illustrious predecessor. His celebrity had a no less distinguished biographer than Oliver Goldsmith. He managed [illegible] such effectiveness a ball given to William III. that the monarch thought him worthy of a knighthood, and offered him one. "Beau" Nash is credited with doing much to add refinement to the social manners of the British aristocracy, in the way of removing, according to Goldsmith, the "awkward timidity" and "censurable reservedness of behavior" which then characterized it. He brought the full influence of all the available civilization that existed to bear on balls and matters of etiquette, and issued a schedule of rules and regulations whereby fashionable society should deport itself.

"The pains he took in pursuing pleasure and the solemnity he assumed in adjusting trifles" testified that he made a serious business of his calling. His authority was supreme, and when the Princess Amelia once asked him for an extra dance at an entertainment, he gave her to understand that the prescribed order of things was not to be trifled with, and she accepted the situation submissively.

Such a man, his biographer insisted, "deserves the attention of the present age." The social status acquired by Nash shows what the kind of fame achieved by him will do for a man in that respect. He was hand in glove with the nobility. The Duchess of Marlborough was one of his particular friends. Goldsmith says of him: "It is a matter of very little importance who were the parents or what was the education of a man who owed so little to either." Possibly it is on this general ground that Mr. McAllister declines to write his autobiography, which, it is stated, he has been asked to undertake. It is not necessary for him to show that he is entitled to social elevation by the successful manipulation, on the part of himself or his parents, of either railroads, or corner lots, or skins, or oil, or soap, or patent medicines, or any other of our customary means of securing entrance to "the first circles."

He is a social director by profession, and steps right into his sphere at once. Thus it was that he opened the New-Year's Ball with the wife of the head of the house of Vanderbilt on his arm, led the *quadrille d'honneur* with a Goelet, and took an Astor in to supper.

This New-Year's Ball has raised the standard of such entertainments, and, by supplying a new and higher point of comparison, will exert a beneficial influence on future occasions of the kind.

DUTCHMEN AT DINNER.

The great hall of the famous Equitable Building on Broadway is the noblest, architecturally speaking, in New York. Its perfect proportions deceive the eye as to its real size, and its rich decoration is scarcely to be appreciated by daylight, for it opens to the outside air only at the two ends, and artificial lights are always necessary, even to its ordinary use as the entrance hall of an enormous business building.

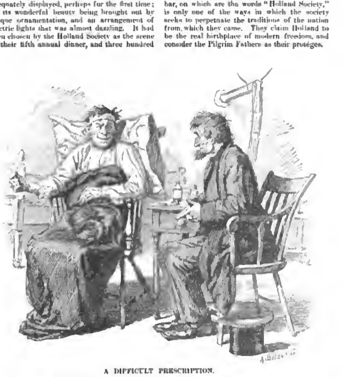
On Friday night, January 10th, however, it was adequately displayed, perhaps for the first time; all its wonderful beauty being brought out by unique ornamentation, and an arrangement of electric lights that was almost dazzling. It had been chosen by the Holland Society as the scene of their fifth annual dinner, and three hundred and fifty Dutchmen sat at three tables set lengthwise of the hall, while a hundred or more of the overflow were served in the adjoining café.

Such elaborate and characteristic ornamentation has seldom been seen at any dinner, in this city at least, though it mainly consisted of tulips, fir-trees, and electric lights. Over a thousand of the lights were arranged over the stained-glass panels in the ceiling, or roof rather, of the hall, while hundreds more flashed from among the branches of the trees that were ranged along the sides, and hundreds of candles lighted the tables. The tulips, however, were the main feature of the decoration. This national flower of the Hollanders was displayed in thousands of varieties. Over six thousand choice blossoms made the coloring of the room as iridescent as a kaleidoscope. The gathering together of such a collection as was perhaps never before seen outside of a mammoth horticultural fair has occupied the society for a full year, and not a man there esteemed his labor lost when he saw the result. Then, too, the tables were garnished with numerous ancient Dutch dishes, and over the head of that famous Lord of Misrule, Robert B. Roosevelt, who presided over the feast, was a huge floral device bearing the words of the old Dutch cry, "Oranje Boven."

And the dining party represented a class of men as distinctive and as distinguished as the appearance of the banquet hall. Not only were there many of the most accomplished and learned gourmets of the city there, but there was an unusual proportion of prominent professional men and men of affairs, and every man was a Dutchman. The Holland Society is one of the most distinctive of all those in New York which have for their purpose the grouping of men of kindred extraction. It was started in 1885 by Aaron J. Vanderpoel, Hooper C. Van Vorst, Lucas L. Van Allen, George M. Van Hoesen, George W. Van Slyck, and George W. Van Siclen. By the terms of its constitution no one is eligible as a member unless he is "a descendant in the direct male line of a Dutchman who was a native or resident of New York or of the American colonies prior to the year 1675." This, however, is farther explained to include "those of other former nationalities who found in Holland a refuge or a home, and whose descendants in the male line came to this country as Dutch settlers, speaking Dutch as their native tongue."

One of the toasts at the banquet on Friday night was "The Sea Beggars," and it was suggestive of the curious badge which, in gold or silver, adorned the lapel of every member's coat. It is a reproduction of the badge worn by William of Orange at the time of his assassination. This badge has on its face the bust of Philip II. of Spain, surrounded by the motto, "En tout fidelles au roy," and on the reverse two beggars' sacks, with two hands clasped in the centre, between them the date 1566, surrounded by the motto, "Jusques à porter la besace," with projecting rings from each side and from the base, in which are hung, at the sides, miniature porringers, and from the base a gourd in miniature. It was adopted in 1566 by the three hundred noblemen who, led by Count Brederode, began the open rebellion of the provinces against Philip II. They appeared before Margaret, Duchess of Parma, who was Philip's regent in the Low Countries, and she was so alarmed at the sight of them that the Count of Barlemont said to her, "They are only beggars." The name was caught up, and became famous throughout Europe, for the rebels adopted it.

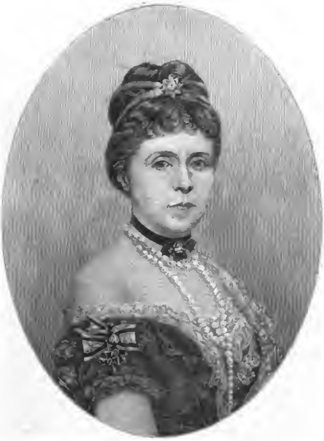
The adoption of this badge, which they wear suspended by an orange ribbon from a horizontal bar, on which are the words "Holland Society," is only one of the ways in which the society seeks to perpetuate the traditions of the nation from which they came. They claim Holland to be the real birthplace of modern freedom, and consider the Pilgrim Fathers as their protégés.



A DIFFICULT PRESCRIPTION.

DOCTOR. "Well, Dennis, did you take the pills I sent you?"

DENNIS. "Indade, docther, an' I did not; ye wrote on the box 'one pill three times a day,' an' I've ben waitin' till I see you to ask you how a man was to take a little bit av a pill loike that three times in wan day!"



THE LATE DOWAGER EMPRESS AUGUSTA OF GERMANY.—[See Page 55.]

WILLIAM DARRAH KELLEY.

JUDGE WILLIAM D. KELLEY, Representative from the Fourth Congressional District of Pennsylvania, died in Washington on January 9th. He had been a sufferer for some time from cancerous and catarrhal troubles, the latter induced by a recent cold. Judge Kelley was born in Philadelphia in 1814, his grandfather being Major John Kelley, of Revolutionary fame, and his father, David Kelley, a jeweller and watchmaker of that city. The financial embarrassments occasioned by the war of 1812 affected the family, and when his father died, shortly after, his mother was left in straitened circumstances with four children. William, however, was sent to school at an early age, and when eleven years old started to work as an errand-boy. For two years he was employed in various trades, being at one time copyholder in a printing-office, where, it is said, he acquired that distinctness in speaking which influenced his career in later life. He was apprenticed to a firm of jewellers at thirteen, where he remained seven years. In 1835 he found work at his trade in Boston, and while there made several public speeches, one of which was delivered in Faneuil Hall. He was then a Democrat and a free-trader. It was suggested to him by Colonel James Page, of his native city, that he should study law, and Colonel Page offered the young man a chance to read with him. The future Judge accepted the offer, registered as a student in Philadelphia, and in 1841 was admitted to practice at the bar. From that time forward his advancement was rapid. In 1845 he became Deputy Prosecuting Attorney for the State, where he made a name for himself as an able and conscientious lawyer, and a year later was appointed a Judge of the Court of Common Pleas. He was elected Judge, under the new law, in 1851, to serve ten years. Some of his judicial decisions were very important, especially in a contested election case, where he made many enemies and gained a host of new friends. He was first nominated for Congress in 1856, on the Republican ticket, but was defeated. He was a delegate to the Chicago Convention of 1860, and after the election of President Lincoln was again placed in nomination to Congress, and elected from the district which he represented until his death, being then known as "the Father of the House."

In 1854 the Missouri Compromise Act, which allowed slavery in that State and in all territory west of it, was repealed by the creation of the Territories of Nebraska and Kansas, and then Judge Kelley signified his intention of allying himself to the party favoring the extinction of slavery. Previous to that time he had been a Democrat; and upon receiving the Congressional nomination, two years later, he resigned his seat on the bench. When he took his seat in the Thirty-seventh Congress he at once became known as an earnest and ardent defender of the Union, and in 1862 was among the first to advocate the arming of the slaves. His early views on the tariff underwent a change some time before his election to Congress. He had been an advocate of the Walker revenue tariff bill in 1846, but the panic which followed altered his ideas on the subject. He was a member of the Ways and Means Committee from 1869 until last year, and was only retired this year from the duties of that committee by his special request. During his period of service upon that committee Judge Kelley earned for himself his famous sobriquet of "Pig-Iron," owing to his untiring exertions on behalf of the metal industries of his native State. It is said that he was particularly proud of this nickname, which was known all over the country, and letters addressed to the "Hon. P. I. Kelley" upon some tariff question were said to be frequently received by him.

His loss will be deeply felt in Congress by the Republican party, where he was an authority upon everything pertaining to the tariff, and where he earned and maintained an enviable name for honesty and sincerity. As a fighter he was fair and manly, and as a friend, loyal and constant.

His political speeches have become widely known, and he published, in addition to other literary and political essays, "Reasons for Abandoning the Theory of Free-Trade and Adopting the Principle of Protection to American Industry," "Letters on Industrial and Financial Questions," and "The New South." Judge Kelley made several trips to Europe, during which he employed his time in studying the conditions of the people. As a result of these investigations, he has published a series of "Letters from Europe."

When not at Washington, he has made his home in his own city, and owned a delightful place in West Philadelphia. His wife and several grown children survive him.

In the House of Representatives, and at a special meeting of the Pennsylvania delegation, resolutions in honor of his memory were passed, and similar honors were paid in the Senate. The funeral services were held in the House of Representatives on Saturday, January 11th, at noon. A number of Senators who had been colleagues of Judge Kelley in the House were present, together with a large majority of other members from the Senate, headed by the Vice President. The Rev. Drs. Butler and Cuthbert officiated.

AMZI S. DODD.

AMZI S. DODD, who died in New York on January 9th, was the founder of Dodd's Express and the New York Transfer Company, both of which are widely known to the people of New York and to the country in general. Mr. Dodd was born fifty-eight years ago, and his early life was spent in Rochester, New York. He received a common-school education, and coming to New York at the age of about eighteen he started as assistant cashier in the Marine Bank. The New Jersey Express, in Newark and New York, was the first step taken in the direction of the great baggage and parcel express which now bears his name. It was a modest venture, two horses and two wagons; but the business proved successful, and before long Mr. Dodd entered into partnership with R. E. Westcott, and for several years they continued in business together. Later, Mr. Dodd bought out his partner, and in 1872 the New York Transfer Company was formed, and Mr. Dodd became general manager and director, in which capacity he continued until his death. The company which was inaugurated in such a small way nearly forty years ago has now over five hundred horses, nearly that number of wagons and trucks, and the list of employés amounts to four hundred men. For a number of years the company has handled the United States mail in New York.

Mr. Dodd has been associated in several public works, and was early connected with the Metropolitan Telephone Company, of which he was treasurer. He acted as an officer or director of a number of institutions, and was a prominent member of several benevolent societies and Masonic and other clubs. For some weeks previous to his death he was out of health, and his death took place at the residence of his married daughter. He also leaves a widow and one son.

THE ANNUAL DINNER OF THE HOLLAND SOCIETY OF NEW YORK.—Drawn by Snyder and Graham.—[See Page 51.]

HOW MIKE DOOLAN'S GHOST APPEARED TO DANIEL HITCHCOCK.

"An' yer saw it furninst ye wid yer own oiyes?"

"Yaas, sir," answered Mr. Hitchcock, somewhat nettled by what he considered the irrelevance of the question. "Whose else d'yer suppose I'd use?"

"P'r'aps hit was a hoptical hillusion," suggested Jim Bates.

To this Mr. Hitchcock deigned no reply further than a stony stare.

"Tell us the rights of the story, Dan'l, an' wphat made yer look enter th' cellar," said Mr. Brock, the store-keeper of Dullville.

They had all gone there on seeing Daniel Hitchcock's buck-board and old sorrel mare in the shed attached to Mr. Brock's store, to hear from his own lips the corroboration of the strange, startling, not to say conflicting, rumors that had been and still were agitating the imaginations of the village. It was scarcely more than a week before that they had been thrown into a paroxysm of excitement on hearing that old Mike Doolan's ghost had been seen on the Hitchcock farm, formerly Doolan. It was beyond that, even, caused by the death of old Morley, the village miser and atheist, who up to the very last had refused to see Mr. Smiley, the Methodist clergyman, or even Mr. Watts, the Baptist minister, both most attentive in trying to see him—Mr. Watts even going so far as to say he would, under the circumstances, wave immersion, and be content with a comparatively *dry* baptism, if only Mr. Morley would make a confession of faith, and so consent to be snatched like a brand from the burning. But Mr. Morley had proved contumacious to the last, and until the last week the final disposal of his soul had been the chief topic of village conversation. They had all taken the gloomiest views imaginable, with the exception of Mr. Smiley, who had preached a funeral sermon on "our late dear brother." A "romance" some called it; a "good recommend," others. Mrs. Morley was a good woman as well as a good Methodist, and no doubt Mr. Smiley, with Christian charity, thought her virtues covered her husband's failings.

But all this had taken quite a back seat since old Mike Doolan had taken to walking, and had appeared to old Daniel Hitchcock, of all men in the world, in the glaring sunlight of an August afternoon. It had caused a refreshing and thrilling excitement, stirring the usually stagnant imaginations of what Dullville called "th' folks" just as the Morley question was beginning to lose its interest. It had lived the usual long life of country excitement, and Dullville felt quite important at being able to have another equally strong following so quickly on the vanishing heels of the first.

The furor it created had reached fever point on hearing the doctor and coroner had both been called to Mr. Hitchcock's place, and on their return Father Quin had been sent to lay the ghost. Women were afraid to go outside their doors at night; they even did not feel quite safe during the day. For had not this most unorthodox of spooks walked in the afternoon? Children huddled together as they played, and positively refused to go to bed without a light in the room. Jake Mace and Joe Brooke, the two wickedest boys in the village, had been actually seen playing at it. Jake, dressed in his grandmother's burying clothes, as the ghost; Joe, Mr. Hitchcock. Mrs. Mace had an attack of most violent hysterics on hearing of the desecration of those sacred clothes that had been waiting for her and their legitimate use for twenty years, and Jake had a most uncomfortable time of it when confronted by his venerable grandmother and upbraided as "a living limb of Satan."

Old Mrs. Scroggins, who lived alone, declared between her screams that "es long es them ten bhoys wus 'lowed ten deu jis es they likes, Christians ain't safe en their beds, an' thet air spook kent be 'spected teu lay."

Many of the oldest inhabitants remembered rumors of foul play when old Mike Doolan had so suddenly disappeared some thirty years before. But there had been only himself, his old wife, and a young daughter of fourteen living in the house at the time. Doolan had not been rich enough to murder for robbery. He had been a harmless, not otherwise old man, somewhat given to drinking; his wife, a hard-working woman, with the reputation of keeping him in order by the virulence of her tongue. A year after the old man's death his widow had sold to Hitchcock, and, with her daughter, gone West.

"Waal, Mister Brock," began Daniel Hitchcock, sitting down to a good long yarn with all the gusto a thorough countryman alone enjoys, "et jis arl heppened en thes way. It wore las' Sunday week—an', es yer arl knows, I don't hold much by church-goin', not bein' a church-member—an' Mrs. Hitchcock, with th' childern, hed goun teu visit hur muthur, an' then wore a-goin' on teu see Sairy Ann, hum thet got married las' fail year teu hur sister's heulp, an' lef' me alarn with on'y Mirindy teu deu fur me. Yer sees Sairy Ann hed bin sick arl an' on a'most the summer with low fever—I allus sed es heow thet low-lyin' land wore onhealthy—an' hurn baby es on'y a puling, sickly kind oaf chile, without no constitootion. Waal, teu make a long story shourt, I foun' it pouty lursome. Mirindy hed gorn over teu Miller's fur Naomi teu go berrying with hur, an' I jis thort es heow I'd go an' see heow the co-arn wore gitting along. Yer knouse eet onter thet bit oaf interval lan' right deown by th' river, an' it's jis growin' splendid. So I carls teu Watch, an' walked deidling like, thur bein' oaf no hurry like, until I got teu the patch. Thur es as good es one hundred bushel teu it wphen husked. I wore a-calculating oaf it, wphen I seed it a-wavin'"—moving his hands slowly—"an' I thort teu myself es th' wind were a-risin', an' et wore jis my luck fur a hail-storm teu cum hup an' lay my co-arn, es et ded onces hup teu auld Moores's plaace—yer r'member, twelve years ago—jis afore he wore a-goin' teu cut it. An' I lucked straight across, still a-seein' oaf its turl heads a-movin', an' jis r'membered es heow I felt no wind stirrin', an' et wore close an' still, es of natur hed furgit teu breathe; an' es I lucked—jis es I might be lukkin' at you, Mr. Brock—I sees an orld man comin' straight teu me, right afore my eyes."

Mr. Hitchcock paused, with true dramatic instinct, and felt, as it were, the pulse of his audience.

Tim Doyle, his small pale blue eyes opened to their widest extent, his curly red hair almost on end, muttered, "Holy mother!" He would have crossed himself, but feared the jibes of Daniel Hitchcock, who was known to be, after Morley, just deceased, a most "onreligious man." He would not have been observed, though, so absorbed was each in his own fears and the story.

"Heow wore he dressed?" asked Mr. Brock, as Hitchcock still waited.

"Dressed! That's wore he hed me. Who ever heared tell oaf a spook dressed en an old suit oaf gray homespun clauthes, wi' a red an' yeller han'kerchief over hes head, tied under hes chin—"

Here Doyle exclaimed again, "Oh, the holy Vargin presarve us, that's ould Doolan to the loife!"

Hitchcock looked at him with withering scorn. "Air you a-tellen oaf this story, Mister Doyle, or me?"

His listeners breathed hard; those sitting, leaning forward, with their elbows on their knees; those standing, pressing close upon each other in their anxiety to get nearer to Hitchcock, and so not lose a word of what he was saying.

"Go on, Mister Hitchcock," said Mr. Green, feeling he must be appeased; "an', Tim Doyle, ef yer aga'n enterrupt, you'll be put ount oaf th' rum. Heow ded he look? Ded he speak teu yer?"

"'Look! speak!' Na; but you bet I ded. I jis thort es heow et wore thet crazy Ikon old Bosquin, thet lives up teu th' san' bar, th' same es mekes th' baskets, fur I could not see hes featurs cl'ar—th' sun wore a-shinin' 'tween us. So I shaded my eyes wi' my han', an' saw hem es plain as I sees ye, Mister Green. So I hollered et hem. 'Wphat deu yer mean a-trepassing on my faarm, an' en my co-arn? Yer jes cl'ar ount, or I'll set th' dog on yer.' An' I'll be blamed ef thet orld man ded not come right on, wi'out a-lookin' or a-takin' enny notice. I hollered aga'n, louder thes time, for I thort es heow he wore deef; an' he hed got close anuff for me teu see he wore not ould Bosquin, an' he hed an' orld pipe en hes mouf."

"It waz him!" Doyle in his excitement could not help exclaiming, his red face blanched with fear. "It's Doolan to the loife. Arl the saints have marcy on us!"

"Mister Doyle," said Dan'l Hitchcock, with magisterial dignity, "I'll be much obliged ef yer'll kindly permit me teu tell my arn story in my arn way."

"A pipe hin 'is mouth," said Mr. Bates, the Thomas of Mr. Hitchcock's audience, "hand hout of a shroud? I don't 'old by ghosts who walk by daylight."

Mr. Bates could not bring himself to believe in ghosts, unless they belonged to old families and moated granges or haunted ancestral halls, and then only in sheets. This was altogether too democratic a ghost for him to put much faith in.

"Ourn spooks hain't bloated aristocracts. They walks es they lives, an' hain't no ways 'shamed oaf the clauthes they found good anuff fur airth," and Mr. Brock felt he had the best of Mr. Bates there.

"Waal, gentlemen, hev yer dun disputin'? Fur ef not, we'll a'journ thes meetin'."

"Proceed, Mister Hitchcock," said Jabez Moore; "an' th' fust thet speaks agin I'll put hem outter th' store."

"Waal, es I were a-sayin', I wore by thes time putty considerably rized, an' I hollered loud 'nuff fur teu be mistook fur th' judgment trump, 'Git ount thes minute, ye air a-trampling my co-arn down,' an' I up wi' my han's like, an' called teu Watch teu go fur him. An' es I lucked, he jis wore not thar! I rubbed my eyes, gentlemen, I tuck hold onter my arms teu feel es I wore myself like. I whistled, an' wore sure es I wore I. But not a sight oaf hem could I see; an' wphen I r'member teu luck at Watch, he wore arl a-crumpled up like at my feet, a-shakin' like quakin'-grass.

"I arns hup I felt scared like, et wore so oncommon the way thet orld man jis went enter nuthen, arl in a minute, tu, wphen he wore not mor'n ten yards from me. An' then I thort es heow he might be a-hiden, fur I jis felt I wouldn't be bent; so I sez teu myself, I sez, 'Neow, Dan'l, orld man, don't yer be skeart like an orld wooman, but go forrard like a man.' So I carled teu Watch, but he wouldn't move, an' went forrard enter th' co-arn. An' would yer believe me, gentlemen, thur wore not a head oaf co-arn a-trodden deown? It wore stan'in es straight es a popler. I felt jis fur arl th' world like Watch, only he hed th' better oaf me en haven fur legs teu tremble on.

"I didn't say a word teu the wemen-folks wphen they got back hum—wemen-folks air sech skeary kettle. An' jis a week arter, my wife she comes teu me, an' sez, sez she, 'Dan'l, here's a letter fur yer.' Wphen she giv' et me, sumthin' sed en'side oaf me, 'Neow, Dan'l, yer'll hear sumthin 'bout yer orld trepasser.' Fur I hed hed a most powerful feelen ever sence I hed seen hem es heow he wore allus near me. It wore a'most es ef I hed seen hem go, so strong ded I feel, wphen my wife giv' me thet letter, the orld chap jis hup an' put.

"Waal, arter I hed lucked et arl ovver—fur et hed a powerful sight oaf stamps onter et—teu see wore it comes from, I opened et, an' Mirindy, my eldest gal, who es a gr'at schollard—she wore eddicated over teu Ridgeway—she re'd et for me. It wore from Marg'et Doolan, orld Mike's darter."

"Howly Moses, presarve us! Pore Marg'et!"

"An' she sez, sez she, es heow hur muthur wore dead, an' she wore a-dyen, an' would not die easy onless she told me abeout hur fayther's death. The preast had made hur promise, afore he would give her th' las' sacrement, teu write teu me; an' by thes token thet we would fin' hes body enter the cellar, we would know es heow hur muthur, arter they hed hed words, hed took hup a stick oaf wood, an' hit the orld man a blow on hes head es he set ovver th' fire, an' she made the gal help hur wi' th' body enter th' cellar, an' burried et jis enter th' riegnt-han' side oaf th' door. An' thar, gentlemen, we found et. Fur my wife sez, sez she, 'Dan'l, I won't 'low yer teu tetch thet thing onless th' docter an' th' crowner be wi' yer, an' th' priest'—wemen air so 'stitious like—'so es teu give th' pore man peace et last.' So Avery, my eldest bhoy—he es jis eighteen—I sent him enter th' village, es yer arl knows, an' he brought ount Docter Jones an' Mister Skinner an' Father Quin; an' I takes a crow-bar an' spade, an' deown we goes. I guess we arl felt scared, but not one on us lets enter th' other, but wore most perlite 'bout who would go fust, an', arter arl, th' priest did; an' thar wore th' bones oaf an orld man, th' crowner an' docter sed, an' pieces oaf gray homespun clauthes; an' then we hed an' inquest on 'em, an' th' docter he sez, sez he, thur wore a crack on th' skull had anuff teu kill three men."

"Is thet arl?" asked Israel Hurst, with the sense of loss that generally comes when nervous tension lessens after the climax has been reached.

"'Arl!' Wphat more ded yer want?" replied Mr. Hitchcock, with fine scorn.

"Pore Mike Doolan! I minds him es a bhoy. It's a troubled bed he's had in, God rest his sowl! The worthless ould woman, to kill a pore ould man that scarce knowed his right hand from his left, faxby he wasn't tould."

"Did yer never see him afore that afternoon?"

"No, sir, never; an' I knows thet patch well, Mister Abercrombie, an' hev lived on thet farm goin' on thirty year, an' hev seen et laid en oats, wphent, an' 'taters, oncet en clover, an' never seed no wone enter et afore."

"An' wphat, Mister Hitchcock, d'yer thenk neow made hem walk on thet 'ticular Sunday afternoon?" asked Mr. Green, with great solemnity of manner, fearing that the ghost might be an invisible listener.

"Waal," answered Mr. Hitchcock, as he turned the tobacco in his mouth, so as to have a better aim at no place in particular, but merely to avoid hitting any of the gentlemen—"waal, Mister Green, I think et wore a purpus teu give me foreknowledge oaf th' letter th' darter wore a-writin' oaf. The date wore the same," and Mr. Hitchcock's keen gray eye spotting Jake Mace, who had pushed himself well in front, one grin of delighted interest from the crown of his brimless straw hat to his little bare feet, a boy he found "no use fur," he directed the full artillery of his tobacco juice in his direction, with such direful effect that poor Jake made a demoralized retreat, too astonished and indignant even to howl.

"Did yer bury him?" asked Mr. Brock; he liked small details.

"'Bury him!' In course, Mister Brock; My wemen wore so right deown skeart es heow th' orld boy might walk agin, they wouldn't settle deown nohow, but wore es peart an' contrary es hunted birds, until I hed got a coffin from Deuls Tang en' collected th' bones. Th' priest he cum ount an' poured a gallon oaf holy-water on 'em, an' they wore kerried teu the Catholic burying-ground. Father Quin is a pleasant sort oaf man, an' he as'ed me ef I wouldn't give one dollar fur masses fur th' repose oaf hes soul. He sed jis heow et would jes be fore masses. But I larfs, I ded, an' sez I—sez I, 'Neow, Mister Quin, ef he hes so little manners left es teu walk agin arter arl I hev done a'ready fur him, wphich hes cost me a'ready twenty dollars, I thenk he'd better stay en purgatory till he l'arns 'em.'"

"Hi thinks you was correct, Mister 'Itchcock, and we are much obliged to you for a most hinteresting and hextraordinary story."

"Begarra!" said Tim Doyle, "he must just be longing for rest, pore Mike must, arfther arl these years of wanderin'. An' to think he still wore smokin' that small dudeen of a pipe beats arl I ever h'ard tell of. Well, gintlemen, I'll be arfther wishin' yez good-night," added Tim, as he left the store. It was growing dark, and Tim felt anxious to return to the "purtiest wife an' childern in the wurruld," waiting for him in the small log house on the edge of the swamp.

Augusta Cox.

THE MAKING AND MENDING OF COUNTRY ROADS.

Time was when the roads of the United States were marvels of badness, and in many parts of the country time has dealt very gently with their defects. The departure of a traveller for a distant city was a more solemn episode in the days of the Revolution and immediately after than is the beginning of a tour around the world to-day. His friends gathered at the tavern from which the stage-coach started to see him off, and with doleful earnestness to drink success to him in his perilous journeyings. His wife and family remained in a wretched state of anxiety until they were notified days afterward of his safe arrival at his destination; but the contentment born of the good news was sadly tempered by the reflection that he must return through the very dangers which he had encountered in going. A trip to Boston occupied the working days of a week. In summer the traveller was choked by dust, and in the spring and fall he was hauled through mud when he was not stuck in it.

The picture of the means of travel which is drawn in Professor McMaster's and Mr. Henry Adams's histories is, of course, a picture of the past. There are no such roads as those over which our forefathers made their painful way, nor is the community any longer dependent on the public highways for intercommunication. The railway has taken the place of the dirt road, the Macadam, the Telford, and all other forms of the highway upon which men formerly depended. So far from being any longer the index of a country's civilization, the public highways are now more nearly suggestions of the wealth and luxury of communities, or of their remoteness from railway centres. If they are especially good, if they are macadamized (this term being now generally used for the designation of any road which has an artificial foundation, or even a top-dressing of stone), we usually conclude that there are many carriages and much pleasure-driving in the vicinity. Occasionally the roads in a New England county town are maintained in good condition for the accommodation of the farmers who retain the habit of hauling their produce to the centre on the general market-day. At Greenfield, Massachusetts, for example, the shire-town of Franklin County, the farmers of twenty-five neighboring towns are to be seen in the village square every Monday. It has been the county's market-day for generations, and the main street of the village is then crowded with wagons from early morning until afternoon. This traffic has necessitated good roads, and there is no finer highway in the country, nor one better preserved, than that which runs through the middle of this beautiful village. It will be found throughout the country, at least throughout the eastern and central portions of it, that the roads are such as the wagonless part of the community can be shamed into giving. In other words, the time having gone by when the bulk of trade and transportation depends upon the public way, the majority of the inhabitants of a community have ceased to be personally interested in the roads. They journey to their business or their pleasure by rail, and they experience physical discomfort from bad roads or streets only when they are forced to wade across them through the mud. In the average village or small city there are a very few carriages in proportion to the number of people, or *per capita*, as the statisticians would say. The store-keepers who are obliged to deliver their goods through the village and its outskirts, the draymen, the hackmen, the doctors, and those who ride for pleasure, are the immediate sufferers from bad roads, and they often pay a heavy tax for the wear and tear of their vehicles and for injuries to horses. Nevertheless, it is too late in the world's progress to say that the condition of our highways is an indication of our civilization. Roads and civilization have very little to do with one another in these days. When they are interdependent, as is shown by the Greenfield illustration, the roads are looked after. Bad roads affect civilization only as they retard the kind of communication that is now almost wholly maintained by railroads. Even the current of social life moves along the railroad track, and visits are paid between adjoining villages a mile or two apart by the aid of the steam-cars.

It is not worth while to put a cause on a false basis, least of all a cause so absolutely dependent upon popular favor as any that relates to local government. Our public highways have not improved as rapidly as other institutions, because they have not remained the public necessity that they were. The railroad has superseded them. It is idle to point to the roads of England and France as examples of what ought to have been done, because those roads were made in coaching days through thickly settled countries, and have not depended for their maintenance upon the selfish indifference of a republic. Our roads are bad, disgracefully bad, and that they are so is one of the worst and most annoying exhibitions of the tyranny of an irresponsible majority. The man who keeps his carriage or his business wagon has a right to demand proper ways for its use. The community breaks faith with him and with all who pay a road tax when it wastes it in the clay mud-holes that are so commonly met in the immediate vicinity of this city.

The readers of Harper's Weekly have been told about the manner of making the best roads. They have not been told very much concerning the nature of good dirt roads. It is essential, however, that every one who is interested in road-making should know how to build a good dirt road, for dirt roads are a great and extensive inheritance from our ancestors, and they abound in every section of the land. The statistics of roads and their cost are interesting in this connection, and may furnish to some of our town and village officers instruction of which they stand very much in need. According to the last census, there were in 1880 in forty-two New England cities, exclusive of Boston, 3604 miles of streets. Of these only 461 were paved, 2449 miles were gravel roads, and 694 miles were the common dirt roads. The census agents who gathered the reports for Mr. Waring in New England almost invariably counted the gravel road as unpaved. The New York agents seemed to regard gravel as a species of paving. In this State fifteen cities, exclusive of New York and Brooklyn, having 1149 miles of streets, possessed 193 miles of paved streets, a little larger percentage than that of New England; but, on the other hand, there were only 330 miles of gravel roads, and 624 miles of dirt roads. It is evident from this that when we say "the dirt road must go," we are reckoning without our host. Roads are improving every year, and will continue to improve; but the dirt road has such a hold upon the mind of the average tax-payer who walks, and of the average village officer and road-master, who knows that the walking gentlemen out-vote the men who ride in chaises, that it is evident that we shall be obliged to make the best of it for some time to come.

Gravel roads and dirt roads are the same, and no difference can be made between them in the treatment of this subject, except as the gravel road is one of the best forms of the dirt road. Even a road upon which there is a top-dressing of stone, there being no artificial foundation, is a form of dirt road. Any way whose organized basis is earth is a dirt road, although there seems to be a prevailing opinion among the road-masters of this immediate vicinity that a slight sprinkling of bluestone on top of the sand or clay substratum changes the character of the road, and elevates it above the ordinary dirt highway. And yet, generally, this little sprinkling of stone simply adds to the inconvenience and danger of the traveller, and does no permanent good. Every one familiar with country life has experienced the discomforts of jolting over the broken stones occasionally scattered upon a road's surface. Usually those who are compelled to drive on a road that has been treated in this manner get over as far as possible on one side, so that a track is soon worn there, the rest of the way being left untouched except by vehicles that have been compelled to turn out. Thus one side of the road needs repairing before the other has begun to show signs of wear.

Any one who is desirous of seeing a dirt road in all its imperfections, and studying an object-lesson in ignorant road-making, can gain all the requisite information and all the experience he can stand within twelve miles of the Forty-second Street railroad station, and almost, if not quite, within the city limits. Let him who wants to see dirt roads run riot undertake to drive from the village of Westchester to New Rochelle along the broad boulevard which goes by way of Pelham Bridge. This way is, with few exceptions, a mass of heavy, sticky mud. The road is full of holes and pitfalls. Here and there are sandy patches which dry quickly, but they are fewer than the oases in the Great Desert of Sahara. Over the bridge the road is narrower, and was once macadamized, but years of inattention have worn it out. It is the road over which the coach of the Coaching Club used to be driven, but now no driver who respects himself, his horse, or his vehicle could be induced to traverse it unless his errand was one of absolute necessity. It is worn down to the metal, and the unhappy man who can neither walk nor ride must go jolting over the foundation stones of what was once a fine highway, and which might have been maintained in its pristine virtue at a comparatively small expense. It now belongs to the city of New York, because it lies within the boundaries of Pelham Bay Park. In consequence of the long lingering proceedings in condemning the property included in the park, it was neglected for several years, the towns refusing to expend any money on what was soon to belong to the city, and the city not having the right to take charge of the work. Now, however, the road from south of Pelham Bridge to New Rochelle is the city's, and members of the park police are to be seen upon it. They are not needed to prevent fast driving. Fast driving is impossible; even moderate speed would necessarily result in the utter destruction of a light wagon. The city's road-master has also gone to work, and whoever he may be, has shown a wonderful capacity for acquiring all the vices that characterize his rural colleague, whose method can be easily studied by an examination of the means employed for mending the road through Pelham Bay Park.

This method is one of extraordinary simplicity. It has been practised by rural road-masters as long as road taxes and road-mending have been known. A plough and some spades are all the tools required. The plough is run through the wet ditches, which are filled with soft, rotten vegetation at the season when roads are mended. The mud and rotting vegetation thus turned up are thrown out into the travelled way. Its principal element is clay, which is usually saturated with the water that has fallen during the wet season. The treatment bestowed upon the boulevard has been also applied to the road beyond Pelham Bridge—the road which skirts some of the fine country places that are now part of the park. The result is that for several miles the highway is a mass of soft clay mud, on which horses are compelled to walk not only on account of the heavy soil, which is so sticky that the lifting of a hoof is accompanied by that sucking sound so full of despair to one who finds himself mired in a bog, but because the soft and yielding mass, notwithstanding the recent mending of the road, has been already worked into holes and dangerous ruts by the swinging and unsteady vehicles which go lumbering and swaying through it. There is no worse example of rural methods of building and mending roads than is to be found in Pelham Bay Park, and these methods prevail wherever there are dirt roads.

In the village of New Rochelle one meets with another vice, the more exasperating because it is exceedingly expensive. There is a habit which obtains in some distant rural communities of throwing brush and branches of trees into particularly muddy spots. This device satisfies the farmer who, with his team and tools, is working out the road tax, because the brush or branches remain in sight until his back is turned, and his annual duties to the town have been performed; but why a similar device should deceive a whole community or satisfy the conscience of a village road-master would be difficult to tell. Perhaps it is all only another illustration of the force of example and tradition. It is the almost universal practice through this neighborhood to throw broken stone into the holes and ruts. The soil is clay, and a suitable foundation is not made before the stone is put upon the road. Usually a very expensive bluestone, costing from $2 50 to $3 a ton, is used. This stone is heavy, so that a ton makes a very small quantity; and it takes, therefore, a good many tons to cover a road, or to fill up many bad places. There is plenty of native stone in the neighborhood, for Westchester County is built upon a rock. This stone has been used whenever the streets have been dug up for water or gas pipes or for a sewer. At such times a good deal of rock has been blasted out by the contractors. No stone, however, used after the rustic fashion I have just described can be of permanent value to a road. With the quickly alternating frosts and thaws of the climate it gradually sinks out of sight, leaving the holes into which it was dumped bigger and more dangerous than they were before.

These illustrations are intended to indicate vices in the making of dirt roads, and are specially valuable because they show how general is the ignorance on this important subject. Wretched dirt roads are not confined to distant rural communities. They may be encountered within the limits of the city of New York, and wherever they exist they will be found to cost nearly if not quite as much as good dirt roads, while they impose upon those whose business or pleasure is dependent upon them extra expenditure, and that in some places is equivalent to the road tax.

A fundamental fact that must be recognized by those who are charged with the task of constructing dirt roads is that a road with a clay surface cannot be good. The surface must be composed of some substance that will not retain water. Another fundamental fact is that while sand makes a much better road than clay, it is too dry and too easily disintegrated by passing wheels for a desirable wagon way. Yet, during most of the year in the Northern climate, a sand road is much better than one of clay. The soil of the road through Pelham Bay Park as far north as the bridge is clay; with the exception of a few short stretches of sand, it is pure, unadulterated clay. The recent rains have made it almost impassable, for the vehicles have churned it into mud, and their narrow tires have cut it into ruts and holes. It cannot be mended until next spring, and, indeed, the kind of mending which has been resorted to only increases the quantity of mud. The road will probably be quite impassable before spring, and the people who are dependent upon it for their supplies of food are face to face with a very serious problem. Such roads are usually prolific of suits for heavy damages against the towns and cities that maintain them. Those who are accustomed to resort to this one for pleasure-driving have already abandoned it.

The proper method of treating clay in making a dirt road is to dig it out, and to cart much of it away. A bed should be prepared for the reception of a foreign substance. The clay surface should be cut to at least the depth of a foot. It would be still better if the spade should go to the frost line; but probably the community that could afford to prepare such a foundation for a road would also afford a better superstructure than one of dirt and gravel. In a clay soil, deep side ditches and draining are absolutely essential. These ditches should allow a fall of from two to three feet from the crown of the road.

The substantial part of the road should be sand. It is sometimes thought that the sand should be mixed with clay on account of its absorptive quality, but usually the presence of the neighboring clay is sufficient to supply the sand in dry seasons with all the necessary moisture. The sand and the surface dressing may involve expense, but expense must be incurred if a good dirt road is to be made in a clay soil. In the long-run it will be found that initial expense, if it is wise, will be eventually a saving, for not only will it greatly reduce the tax for mending, but the incidental cost to citizens of wear and tear will be lightened. The best surface dressing for such a road as I have been describing is gravel or shale. If it can be afforded, limestone crushed into minute particles is most excellent for this purpose. A road to which this substance is applied requires a hard smooth surface, for the action of water and the grinding of passing wheels transform the stone into a cement. Professor Shaler recommends the use of vegetable substances where gravel and shale cannot be easily procured, such as twigs, small branches, and even pine needles. He also mentions the fine wood shavings known as "excelsior" as a good material, from some experience that he has had of roads to which it has been applied in the Western States. Tan-bark is also a very good top-dressing. It is unnecessary, however, for any community in this part of the country to resort to such makeshifts, for sand and gravel are abundant and cheap enough to warrant their use by a town or village that can afford to build any but the most primitive thoroughfares. Indeed, there is every pecuniary reason why all the principal roads in the neighborhood of New York should be macadamized. And here it may be permissible to call attention to one local consideration which I do not recollect to have seen mentioned—that is, the presence of large quantities of excellent road-making stone. Every town should have its crusher, but all towns do not have this useful machine; and there is no reason why the farmers who possess the material should not break it up by hand in the winter for use on the roads in the spring. It would be much better for the highways if they should be permitted to thus work out their road tax, instead of by ploughing mud out of a ditch to the ruin of the way. The actual work on roads should be by day's work, paid for with hard cash.

The problem of building a road in sandy soil has been already partially indicated. The ditching along the sides should be shallower, and there should be an admixture of clay, for the purpose of preventing the excessive dryness due to the non-absorptive quality of the sand. There is precisely the same necessity for a top dressing for sand roads as for those which have been described. In making a road in clay soil we simply accomplish what Nature herself has done in the sandy soil. We make a bed which cannot long remain in a state of mud, mud being the great enemy of progress and of the structure of the road. The sandy soils afford a very much better material for ways than the clay, but during the summer their dust becomes almost intolerable; in other words, moisture is needed, while in clay soils it is essential to produce the opposite condition. It is for this reason that the side ditches should be shallower than those dug by clay roads, because it is not well that the rain-water should flow off. Therefore road-masters ought to mix clay with the sand, to perform the office which is the task of the bottom and embankments of the clay roads. There should be also the top-dressing of gravel, stone, or vegetable matter, in order that wheels and horses may have a firm surface. This is as essential in the one soil as in the other. The sand is often bound together and prevented from shifting by planting quick-growing trees along the edge of the road, the interlacing roots keeping the way in place. A wall of any kind will accomplish the same result. The tendency of the loose sand is to slip away before the pressure of the burden, so that a broad untrammelled road of sand is only less difficult to the horse than the muddy clay highway.

The cost of a good road is the standing objection in rural communities to its construction. As a matter of fact, in the end good roads cost less than bad roads. Captain Greene went so thoroughly into this phase of the subject in his article on asphalt, macadam, and other first-rate roads that I shall content myself with giving some striking statistics from the census of 1880. They show how some towns excel others in maintaining for less or the same yearly expenditure a greater or an equal mileage of roads. It is fair to say, of course, that in some instances a good many of the towns hold the advantage by reason of their better system of local government, the town meeting being much more effective and economical than the village government.

Augusta, Maine, in 1880, spent $12,000 on 150 miles of road, 145 of which were dirt. For $15,000 Gloucester maintained 140 miles of gravel road; for $5300 Manchester, New Hampshire, maintained 125 miles of road, 90 of which were gravel, 4 paved, and 31 dirt. If we examine some of the statistics of this State, the comparison becomes still more instructive and interesting. The expenditure of Elmira, for example, was only $2300 less than that of Gloucester; but while the latter maintained 140 miles of gravel road, the former maintained only 75 miles, 72 of which were dirt. Waltham, Massachusetts, maintained 80 miles of road—20 paved and 60 gravel—for $450 less than was expended by Elmira. Lewiston, Maine, spent $15,000 on 68 miles of dirt road and 2 miles of paved streets; Weymouth, Massachusetts, spent $5500 on 90 miles of gravel road. Bridgeport, Connecticut, spent $4000 on 89 miles of gravel road and 1 mile of paved street; Binghamton spent the same on 40 miles of dirt road and 2 of paved street. Yonkers expended from $15,000 to $20,000 on 20 miles of paved streets and 38 miles of dirt road. This is not an accurate measurement of the relative cost of good and bad dirt roads, but it affords substantial evidence that the good roads are the cheapest in the long-run.

Henry Loomis Nelson.

THE DEAD EMPRESS AUGUSTA.

On the afternoon of January 7th, the day on which the remains of the Donna Theresa, the ex-Empress of Brazil, were borne in state to their last resting-place, the Pantheon, in Lisbon, the Dowager Empress Augusta, of Germany, peacefully breathed her last at Berlin. The immediate cause of her death was an attack of the prevailing influenza, which, after a relapse, developed into pneumonia. At her bedside were the Emperor and Empress, and their two eldest sons, the Crown-Prince William and Prince Frederick, and the Grand Duke and Grand Duchess of Baden. One of the latest visitors at the palace was Count Von Moltke, who went away much affected by her alarming condition. The esteem and affection in which she was held by the people were indicated by the crowd that assembled in Unter den Linden, before the palace, to express their sympathy for the Empress, and there they remained until the lowering of the imperial standard from its place over the palace announced her death to the people. As the end came, the mourners who were with her, her near relatives and her much-attached attendants, knelt around the bed, and the court chaplain offered a prayer, and then blessed the remains.

With the death of the venerable Empress, at the age of nearly eighty years, another eminent personage has passed from among those prominently identified with the events that through the larger part of the present century were leading up to German unification and the brilliant conquests of the German arms. Her performance upon the stage of human affairs has been an unnoted one by comparison with that of her famous husband, Emperor William I., and the great men who were his counsellors, but in every condition of her exalted station she has borne herself appropriately and fulfilled all its requirements. Her tastes were literary and domestic. Amid the military and diplomatic activity that marked the epoch following the ascension of her husband to the throne of Prussia, she liked to surround herself with literary men and women, and she was a liberal patron of music, literature, and the arts.

In a recent English book published in London the writer thus describes the Empress Augusta as she appeared in the earlier days of her court life: "Long after the first blush of youth had faded she was a superbly handsome woman; her shoulders especially were magnificent. No woman in this century understood in so high a degree the graces and minutiæ of royal receptions; she had the rare and precious gift of tact. She had the formulary of courts at her finger-ends. In her clear, high-pitched, slightly ringing voice she improvised a conversation, mostly a one-sided one, with wonderful facility, sparing the other party even the trouble of responding, and never committing a blunder."

The Empress Augusta, born in Weimar, September 30, 1811, was the daughter of the Duke Charles of Saxe-Weimar. A bright child by nature, she grew up in a literary atmosphere that stimulated her, and her grace and vivacity at the age of eleven years won the praise of the poet Goethe. When, on his seventy-third year, she presented him with a laurel wreath and an address in verse, the old man, in his emotion, exclaimed, "My lovely queen of flowers!" In her early girlhood she wrote several excellent poems, and the dramatist Carl von Holtei, writing from Weimar in 1827, praised her taste and talents, adding, "Everybody at court loves her as the apple of his eye."

Her marriage on June 11, 1829, with Prince William, second son of William III., King of Prussia, was a union that was deemed a desirable one on motives of policy, but it brought little domestic happiness. Her husband, afterward King of Prussia and Emperor of Germany, was then Lieutenant-General in the Prussian army, commanding the Corps of Guards. His tastes were military, and he was fond of the camp and campaigns. For the literary life and surroundings that his wife loved he had small sympathy. When, at the death of Frederick William, in 1861, her husband ascended the throne of Prussia, she fulfilled in the most gracious manner the duties of the court ceremonial, and scrupulously performed the exacting social duties required of the Queen; but she found her greatest happiness in the company of her children, Frederick, afterward the Emperor of Germany, and Louise, who in 1856 was married to the Grand Duke of Baden. She devoted herself unstintingly to the performance of her domestic and religious duties, and through her whole life was devoted to the interests of the German people.

At the outbreak of the German war with France she left Coblentz, which she loved, and where she had resided for twenty years, and took up her residence in Berlin. She was prominent in every undertaking for the relief of the wounded and sick soldiers, and was deeply interested in the struggle. Her husband wrote to her often from the field of war, and some of his letters to her became public and famous. She was his companion in his final triumph, and he died holding her hand. She was called on to watch the sad illness of the German Emperor Frederick, and to see him die. After these bereavements she led a retired life of great privacy, but to the last she was the unostentatious and liberal dispenser of many charities, and she was the companion and helper of her daughter-in-law the Dowager Empress Frederick in her philanthropic efforts to raise the condition of women in Germany.

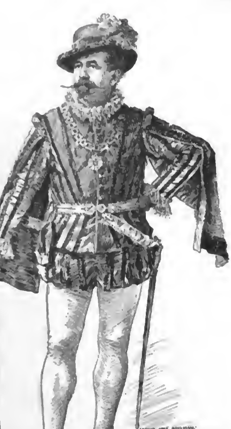
In her memory the streets of Berlin were draped, and the court festivities, which had been resumed after the expiration of the period of mourning for the Emperor Frederick, have been abandoned. The Emperor has ordered that the court go into mourning for three months, has fixed a period for general mourning at six weeks, and has ordered that the theatres and other places of amusement be closed for a week.

CALVIN STEWART BRICE, OF OHIO.

Calvin Stewart Brice, whose nomination on Thursday by the caucus of the Democratic members of the Ohio Legislature is equivalent to his election as United States Senator to succeed Henry B. Payne, was born in Denmark, Ohio, on September 17, 1845. His education was gained at first in the public schools of his native town; later he attended school at Lima, Ohio; and in 1858 entered the preparatory classes of Miami University, Oxford, Ohio.

In April, 1861, although only fifteen years old, he left college for the army, and served in the Virginia campaigns of 1861–2. He then returned to college, graduating with distinction in June, 1863. A year later he organized Company E of the 180th Ohio Infantry, and went with his regiment to join the Twenty-third Army Corps in Tennessee, Georgia, and the Carolinas. He was promoted Major on the field for personal bravery. The war ended just before he received his commission as Lieutenant-Colonel, to which rank he had been promoted, so that he was mustered out still a Major.

After the war he entered the Law School of Michigan University, graduating in 1866. At Cincinnati he was at once admitted to practice at the bars of the United States and State courts. He turned his attention immediately to corporation law, and soon attained considerable distinction in his chosen field. This line of business gave him opportunity to become interested in various enterprises of magnitude and importance. About ten years ago he came to this city as counsel for the Lake Erie and Western Railroad, and shortly thereafter relinquished the practice of the law to devote himself more closely to railroad development and to give personal supervision to his other interests. In 1887 he was elected President of the Lake Erie and Western Railroad; he is also interested largely in many other railroads, among them the New York, Chicago, and St. Louis (the "Nickel Plate Road"), the Richmond and West Point Terminal, &c.

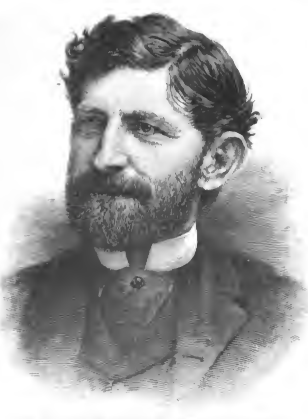


MR. WARD McALLISTER AS THE COUNT DE LA NOLLE, LOVER OF MARGUERITE OF VALOIS.—From a Photograph.—[See Page 51.]

South Shore, and Atlantic Railroad, of which he is Vice-President.

Mr. Brice has always been a Democrat, and has taken great interest in State and national politics, hitherto without either expectation or desire of preferment. He has been a delegate to almost every county, district, and State convention in Ohio since the war. In 1876, in 1880, and in 1884 he was on the Democratic electoral tickets, and in 1888 he was a delegate at large to the Democratic National Convention in St. Louis, elected by the largest vote ever cast. In winter Mr. Brice lives in this city, his home being at No. 693 Fifth Avenue; in summer he goes with his family to a "cottage" at Newport. Mr. Brice is a hard worker, and though his office hours are short he accomplishes a great amount of work in them. He is fond of art, and has collected a number of valuable paintings; his library, also, is a good one. He is fond of entertaining, talks well, and is not niggardly of his mind.

Although Mr. Brice is certain of election as Senator from Ohio, it is possible that a contest may arise as to his right to take his seat in March, 1891. He lives in New York, although he maintains a legal residence in Ohio. The Constitution, however, provides that "no person shall be a Senator . . . . who shall not, when elected, be an inhabitant of that State for which he shall be chosen"; and the decision of his eligibility is to be determined by the Senate, whereof the political complexion is Republican. Should Mr. Brice be unseated, he will be in company with Albert Gallatin, the only other Senator declared ineligible under the Constitution of the United States.



HON. CALVIN S. BRICE, SENATOR-ELECT FROM THE STATE OF OHIO. From a Photograph by Fredericks.—[See Page 50.]

MONEY, TREASURY, AND CONGRESS.

The return to ease in the money market at the close of Friday last proved to be genuine. On Monday, when the first new loans since Friday were made, the rates were 6 and 7 per cent.; and since then money on call may be quoted 5 and 6, with lower rates not infrequent toward the close of the day. It seems reasonable, after what has been seen, to believe that the spasmodic rates of the end of December and beginning of January would have been entirely prevented if Secretary Windom had disbursed his January interest the day after Christmas. This might have been done as well as not, to the great relief of a money market in which preparations for January disbursements are notoriously larger in comparison with the amount of material on hand. If the Treasury funds were in bank, matters would go more easily; but they are kept in the Treasury vaults, and therefore the Secretary is bound to do his best for the convenience of the community which his collections have depleted of currency; particularly as he has ample authority for prepayment.

The call which Secretary Windom made at the end of November upon national bank depositories for 10 per cent. of their Treasury deposits was made to mature January 15th, and was to be followed by other calls from time to time. Considerably more than the prescribed amount of security bonds have been sold to the Treasury in settlement of deposits, and the first call has been in that respect a success. It is not clear whether it has been as successful in reducing deposits all round, and for that reason, as well as because of the nearness of January 15th, there is some anxiety as to the next call which Mr. Windom may issue. The best course open to him is to ignore the subject altogether and call in no more of the deposits, since they are the means of mitigating the severity of the Independent Treasury system. But there is no reason why he should not require interest on his deposits in all cases where he does not receive from the depository bank some service which repays the Treasury for the use of its deposits, and this course would tend directly to facilitate his purchases of bonds. The matter to be kept always in view is the damage inflicted upon the community by the locking up of large amounts of its money in the Treasury vaults—the only example of a really idle hoard now remaining in the modern world. So far as the law authorizes the Secretary to employ the Treasury resources to relieve the community by purchase of bonds and by deposits in banks, so far he will be held accountable for the use of his power. Beyond that the remedies lie with Congress.

Now the purchases of bonds by the Treasury are very good evidence of the surplus income of the government, since under our system they absorb the greater part of it. As everybody knows, there is a Sinking Fund for the reduction of the bonded debt; but it does not seem to be generally known that for many years past the total of bonds purchased and cancelled has far exceeded the requirements of the Sinking Fund. Secretary Morrill called attention to this in 1876, showing that although occasionally the purchases of a year were below the Sinking Fund requirements of that year, yet the total of purchases was greatly in excess. From the manner in which he stated the facts, it seems that he considered them an argument in favor of reducing taxation. But the official view has been that expressed by Secretary Folger in 1882, namely, that there was a deficit in the Sinking Fund every time that a year's purchases were smaller than that year's requirements. Surely it is time that another view prevailed, and that Congress declared the Sinking Fund full for the number of years covered by the present excess of purchases over the aggregate requirements of the Sinking Fund. Senator Beck has introduced a bill to suspend the Sinking Fund law until further order of Congress, and states the present excess of purchases of bonds at 716 millions.

This means that bonds enough have been paid off to satisfy the Sinking Fund for fifteen years to come. The wonder is not that such a bill is introduced now, but that the law was not suspended long ago. If Congress realized, as a matter of plain business aside from political feeling, how enormously the people has been mulcted to buy bonds in excess of any legal needs and at fancy prices, it would surely call a halt in this wasteful business. As the revenues of the government now run, bonds have to be bought at the rate of 100 millions a year; more than twice what is called for by the Sinking Fund, even if that requirement were not already more than satisfied. What will become of Senator Beck's bill it is impossible to say; the preamble of it contains much that is not necessary to its purpose, and perhaps the process of amendment may destroy the measure. But he deserves credit for attempting to suspend the Sinking Fund law, and the attention of Congress and of the whole country ought to be called to the subject. It is plain that no bonds are wanted for fifteen years to come, and just as plain that bonds will continue to be bought, and perhaps at still higher prices, unless the government's income is radically cut down. It looks as if 100 millions of taxes ought to be struck off, for that is what it means now to stop buying bonds, aside from any question of current expenditures. The bonds would take care of themselves, and the 4½ per cents, maturing next year would be eagerly renewed at a material reduction in the rate of interest.

No better service to the country can be done at this time than to call attention to this matter of the Sinking Fund. A bill to suspend its operation ought to be introduced also in the House, and it would be a great public gain if two such bills were introduced—one by a Republican and one by a Democrat. The subject is worthy of the leading men on both sides of the House. There will be plenty of Congressmen to maintain the narrow view—the view hitherto held by officials and tacitly accepted by others—that the Sinking Fund requirement must remain a yearly requirement, no matter how much it has been exceeded in the aggregate. But there is room for leaders who shall demand that the people receive the benefit of their sacrifices, and be relieved from burdens that are now absolutely useless. It is hoped that Mr. Lincoln's celebrated phrase was true of his own country, and that this is a government "of the people, for the people, by the people." Let the people's representatives do something to justify this hope, and take this decisive step to relieve the people of a great and unnecessary burden. **Henry J. Macdonald.**

New York, Friday evening, January 10, 1890.

WAKED UP EFFECTUALLY.

A lethargic, dormant condition of the liver is hardly to be overcome with drastic cathartics and nauseous cholagogues. A gentler, pleasanter, and far more effective means exists of arousing the organ when somnolent. This is Hostetter's Stomach Bitters, vouched for by the medical fraternity, tested by the public for many years. A resumption by the biliary organ of its secretive function, with the activity attendant upon health, a return to regularity of the bowels, and a renewal of digestion, are the no less happy and certain results of using the Bitters systematically. Its laxative effect is never painful and drenching, its tendency being rather to perpetuate regularity than to produce a copious action. Malaria, nervousness, debility, kidney troubles, and neuralgia it subdues effectually.—[Adv.]

Pierre, the Capital of South Dakota, is its geographical centre and on the Missouri River. It has water-works, electric lights, street railway, brick business houses, fine hotels, three brick school-houses, Presbyterian University, U. S. Indian Industrial School, seven churches, and many other attractions. No place offers better opportunities for investment in lots, farm lands, and investment securities. For specific information, address Palmer & Crabtree, Pierre, South Dakota.—[Adv.]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. 25 cents a bottle.—[Adv.]

THE VOICE.
Those who overtax the voice in singing or public speaking will find "Brown's Bronchial Troches" exceedingly useful, enabling them to endure more than ordinary exertion with comparative ease, while they render articulation clear. For Throat Diseases and Coughs they are a simple yet effective remedy.—[Adv.]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[Adv.]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures
Cramps, colic, colds; all pains. 25 cts. a bottle.—[Adv.]

Do not use any of the so-called tonics when you can obtain a pure extract of malt by the use of Nicholson's Liquid Bread, which is not an experiment, but an established success.—[Adv.]

CORNELL'S BENZOIN COSMETIC SOAP
Prevents and cures chapped hands. 25 cts.—[Adv.]

Beale's Pills.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[Adv.]

Secure a sound mind, which seldom goes without sound digestion, by using Angostura Bitters.—[Adv.]

Dr. Lyon's Perfect Tooth Powder. Whitens the teeth and purifies the breath. 25 cents.—[Adv.]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[Adv.]

When eyes and inflamed lids indicate an impure condition of the blood, the best remedy is Ayer's Sarsaparilla. It vitalizes the blood, regulates the secretions, and expels all scrofulous humors from the system. Try it. Price $1. Worth $5 a bottle.—[Adv.]

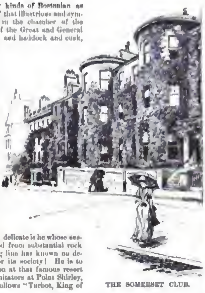
THE CLUBS OF BOSTON.

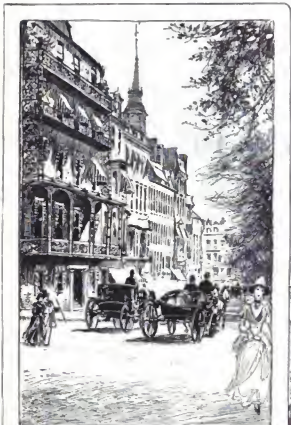
BY HENRY LOOMIS NELSON.

ILLUSTRATED BY EDMUND H. GARRETT.



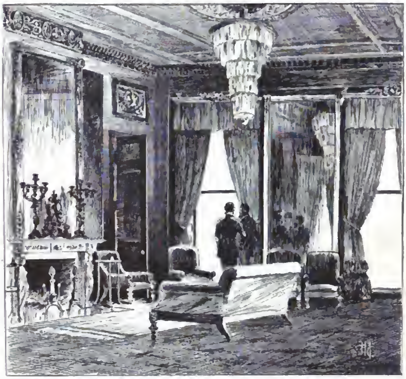
THE SOMERSET CLUB.

THERE are as many kinds of Bostonian as there are varieties of that illustrious and symbolic fish which hangs in the chamber of the more populous branch of the Great and General Court. There are hake and haddock and cusk, never wandering far from home, content to spend their days in local waters, and to cater to the humblest appetites. There is the deep-sea swimmer, the crowning glory of the civic chowder, who, still redolent of his briny birthplace, travels from end to end of this broad land, finds his way into the most foreign of foreign parts, furnishes the material for the honest fish-balls of a nation, and occasionally for some of its dishonest deviled crabs. Last and best, there is the distinguished and aristocratic rock-cod. How delicious, toothsome, and delicate is he whose sustenance has been derived from substantial rock bottoms, and whose long line has known no deterioration in its food or its society! He is to be found in his perfection at that famous resort of gourmets and their imitators at Point Shirley, where he immediately follows "Turbot, King of the Sea." Some of the human rock-cod, like Mr. Howells's Bromfield Corey, are even scrodded. Cod-fish aristocracy indeed! Is there anything finer to be had among the nobility of our republic?



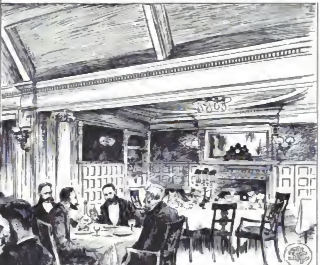
THE UNION CLUB.

There is variety of human nature in other cities, but in Boston there is added the informing and diverting spirit of intense locality. The capitalist recommends an investment because the corporation is controlled in Boston. Boston hospitality fills one to repletion. The Boston of the rock-cod quarter, if you are thought worthy, admits you to its mysteries, and then shows its faith in itself by assuming that you are on its own superior level. The tradesman tells you that his silks, his satins, his gimlets, and his patent button-holes are made expressly for the Boston market. The North End fruiterer sells you a peach grown from a tree planted and raised by a Delaware man whose son married a Boston girl or the cabman who drives you to the station informs you that the Bostons have once more beaten the Giants. The very Irishmen mingle the city's pronunciation with their brogue. So seriously are these people impressed with themselves that they have gone to the extreme length of mixing their punch with a joke, as if it were a fundamental and basic truth that their town is really the hub of the universe.



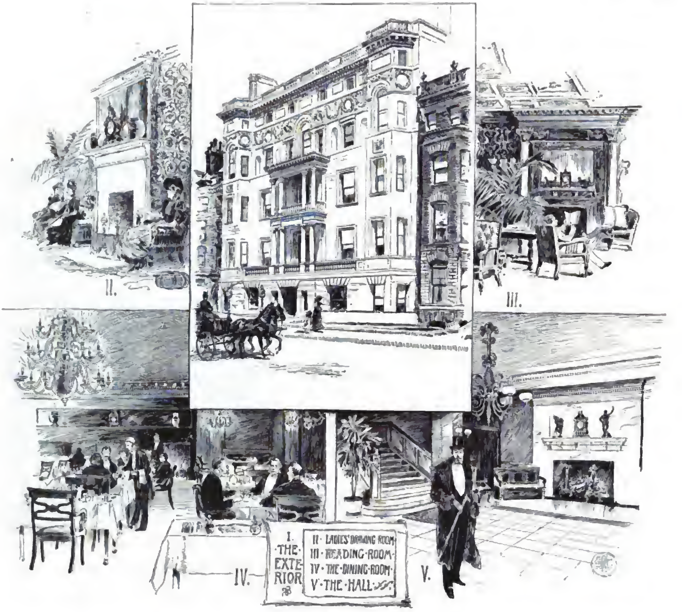
THE SOMERSET CLUB DRAWING-ROOM.

This civic pride has been a tower of strength to Boston. Speaking of it as if it were an individual, as we may, because its population is homogeneous, it has more character than any other city in the country. A small New-Yorker who does not appreciate the true value of his own cosmopolitanism, or a denizen of any other of our great towns who does not comprehend the desirability of a large and interesting variety in the municipal life of the nation, may regard Boston as pretentious. It is, however, no more than self-respectful. It admits the peculiar excellences of other places. It has no rivals. It does not boast of its riches, but of its history and achievements. It preserves the memories of its Sons of Liberty and its Liberty Tree by carving a fac-simile of the latter, with an appropriate text, in brown stone on a brick store. It informs you by means of memorial stones of the site of John Hancock's house, of the legends of the ancient burying-grounds, of the home of Webster, and the birthplace of Franklin. The Old South still stands, and the spire of the Old North, in which shone Paul Revere's signal-light, still points upward. The people glory in their base-ball team, their pugilists, their yachts, and their university. The faults of the town spring from certain virile virtues which are sadly lacking elsewhere, and which give to its streets, byways, and localities an Old World charm. Its vivacious intellectual life makes its atmosphere stimulating, and its society by far the most entertaining that can be found on this side of the water. While those who make literature their occupation have run after the publishing houses of the larger abodes of wealth, a goodly number of those who remain behind pursue literature and art for their own sake, and utilize them, as other Americans do not, to grace their pleasures.



THE UNION CLUB DINING-ROOM.

It is sad to relate that, in the midst of all these virtues, there are growing up a set of Bostonians who have felt to the damage of their local pride the large and potent influence of the outside world, and there is fearful intimation in this that generations may be born who will destroy the individuality of the fine old place. There are even now native Bostonians who, having learned to revel in the material joys of other cities, do not know where the old elm stood; who, when they see the boys sliding down the hill on the Common, do not recall the historic fact that these youths are exercising a sacred right, erstwhile vindicated before the British General Gage; who hear with wondering surprise the names of Allston, Bowdoin, and the other thoroughfares of the labyrinth that lies in back of Pemberton and Bowdoin squares—streets in which once rolled the equipages of the great. There are even people in the old town who wait for the approbation of New York before they accept the stars of the social and artistic world—a tendency which has resulted in the apotheosis of some exceedingly earthy material. The city's cult has so little influence on some of the younger generations that there is danger even that Boston, of all places in the world, may some day



THE ALGONQUIN CLUB.

become one of the many homes of unhonored prophets. At any rate it is time that something should be done to fix the spiritual fly in amber.

Boston is fondly supposed by some of its more untravelled inhabitants to be the city of clubs. It is true that for a town of its size it has a large number of these institutions; but Boston is not by any means to be measured by a census of the people who sleep and have their washing done within its gates. Boston in this respect, like no other city in the land, includes its many suburbs. If we consider its business interests and the people who transact them, it comes very near to being, if it is not, the third city of the United States. The real population of Boston will nearly double the apparent population. That is the reason why it sustains newspapers with circulations reaching above 100,000, and so many theatres. It is true, however, that the clubs of Boston illustrate with remarkable clearness what we have been recently saying concerning clubs in general. Nowhere else have the clubs been more completely a reflex of the life about them, and from which they take their being. They have been as aristocratic as the rock-end influences could make them, as intensely local as the municipal Fourth of July oration, literary and artistic without the effort that in other less-favored spots attends the wearing of "culture's garland." It has always been possible to test the state of Boston's best society by the touchstone of its recognized aristocratic clubs, and to find other phases of its civic and social life mirrored in the haunts of the money getters, the politicians, and the rest, including the very best. Are there money getters in Boston? Yes; and as eager as the worst of those whose pockets swell and flourish with their gains. The pursuit of riches is one of Boston's sins, and one whose effects are most baleful. It has wrought such havoc that an enlightened graduate of Harvard College—a writer, too—has been heard to declare that the true worth of a newspaper is to be measured by the money returns to its publishers, which, in our own unenlightened metropolis, sounds very much like saying that the intellectual and moral standard of the many is the highest and best. The men of Boston who have wrought out their own wealth, however, seem also to work out a species of salvation for themselves. There is a chastening influence in their environment. They may not all become as ambitious as the wealthy grocer who married a school-mistress late in life, then took to the study of Homer, and became so immersed in the tales of Greek (translated), as to occasionally awaken the wife of his bosom with some such question as, "Sally, what was the names of those Greek generals that fell out about what's-her-name?" Although the grocer reached high-water mark, there is a general recognition in the town which remembers that Ralph Waldo Emerson was born in Summer Street, that the rich man who does not devote the leisure which his money gives him to the improvement of his mind neglects his first duty as a citizen. There are not many rich men in Boston content to see their sons grow up in the shadow of Harvard University without receiving some of its benefits; and if there were, the sons themselves would not consent to be prevented from taking the step which may eventually range their grandchildren in the very first circles, for it is harder for a Bostonian born out of the purple to enter the best society than it is for a rich man to enter the kingdom of Heaven. There was once upon a time a great merchant, statesman, and friend of education in this exacting city, whose name was known everywhere, but whose offer of marriage was refused by a poor but proud daughter of an ancient lineage, because he was then in trade. He was prosperous, but as yet he had gained only wealth.

This feeling is very wrong in a republic. There is no doubt that this is the popular and proper belief, but the lofty spirit of rock-end aristocracy has produced some very fine results, and among them nothing is better or nobler than the sentiment that every young man who inherits wealth must do something on his own account, something worthy of the man or men whose labors have made for him his fortunate place, something as much better than anything they were able to accomplish as his opportunities are greater than theirs. It is wrong, of course, in a republic to be proud of one's grandfather, but the cheerful philosopher will try his very best to see the bright side of even that deadly sin. It was very silly in Governor John Hancock to insist that the President of the United States should make the first official call when he was within the borders of the commonwealth of Massachusetts; but even when we read that Washington was kept shivering on the Neck by reason of the Governor's silly notion, the name that was writ so large at the end of the Declaration of Independence cannot be overlooked.

Of all the clubs of Boston the Somerset more than any of the others represents the spirit of the old city, the thoroughly distinctive Boston. It is local in its character and its traditions. The head of the board of trustees by whom its property is held—ex-Mayor Prince—is perhaps the oldest, and like Joseph Addison has been the "most resolute club man" of his time. Years ago, in 1826, the predecessor and ancestor of the Somerset Club was founded. In the language of its day it was called the Quarantine, because it was composed of "forty gentlemen of good family and position, sufficient fortune, and congenial pursuits and tastes." If ever a modern club was founded on the coffee-house gatherings of the wits of Anne's time it was the Quarantine, for there were wits in Boston in those days whose charming flavor continues to lend its delights to the talk of those who lived with them and remember them.

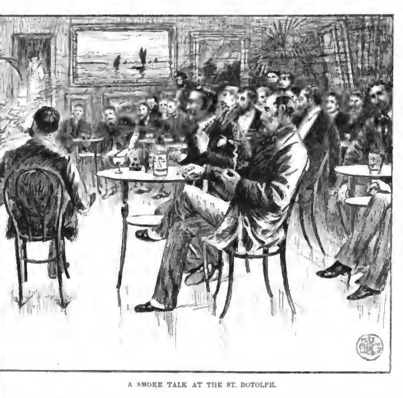
When the club was organized Boston was a little city with its own peculiar habits. The merchants and professional men went to their stores and offices very early in the morning. At noon every merchant was at the Exchange—which has just been demolished—for the purpose of meeting those whom he desired to see. The Exchange was only a place for meeting and making engagements. Business was not transacted there as it is in the modern Exchange. At two or three o'clock every one in Boston dined. There is a survival of this custom in the practice of the modern dining clubs of holding their fortnightly or monthly entertainments in the middle of the afternoon. Then came the tying up of the ends of the business strings, and then the club.

In that time, when a competence was a sum that would now be but the beginning of a fortune, there were idle men about town as there are to-day, but idleness and dissipation were excusable only when they were accompanied by wit. Classical learning was fashionable, and so was brandy. It and play were temperately indulged in, however, for temperance was the rule in the best society of Boston. When the curfew tolled the town was abed, and only a few exceedingly reckless blades could be found in the streets after the conventional hour. It was a day of supper parties and modest early dances, and of stern hostility to display. Men still living and taking an active part in the affairs of Boston recollect when it was vulgar to be extremely fashionable, and when liveried coachmen and footmen were counted as marks of under-breeding. Rich dressing, it is true, was always characteristic of the Bostonians. Hancock's velvet coat has passed into history, and Copley's brush has preserved for us numerous costly damask dressing-gowns and silken turbans. The society that frowned upon liveries and display respected rank most thoroughly, and the man who had social position garnished himself in accordance with his presumed deserts. It was the fashion to stop at the club on the way home to tea for the purpose of taking one glass of brandy and water, and to listen to the conversation that was pretty sure to be stimulating and entertaining.

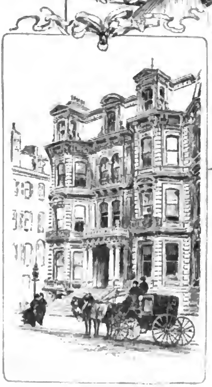
In the mean time the Quarantine had outgrown its forty congenial gentlemen, and had become the Temple Club, having moved its house into the street from which it takes its name. There was no restaurant. The club-rooms did not furnish to visitors the comforts and accommodations that are to be found at the modern houses. It was not an organization of good fellows who dropped in and dropped out, read the papers, chatted if they felt inclined, and wrote a note or two. It was every afternoon a real assemblage of the good fellows who met for the purpose of mutual entertainment over their glass of brandy and water.

How different were the manners and customs of New York and Boston! When the gay youth of the Puritan city sought for new and strange forms of dissipation, they came on to the metropolis, and if they were fortunate enough to belong to the Temple, they were entertained by their brethren of the New York Club. In the course of the joyous festivities which attended these visits the members of the Temple Club made a startling discovery as to brandy. The liquor furnished by the two establishments seemed to the cultured palates of the Bostonians to be of the same quality. The two clubs paid and charged the same price, and yet the New York Club made money on the brandy, while the Temple Club lost. The problem vexed the club mind of Boston for many a wretched day. It interfered with the flow of wit, if not of spirits. Finally a demijohn of the New York brandy was bought, and a regular account with it was opened, and still the club lost money. Every drink was charged, but the cost was greater than the receipts. The keenest intellects of Boston were not to be defeated by a brandy bottle, and at last the theory was accepted that a Boston man took only one drink on his way home to tea; that, expecting no more, for he spent his evenings in the bosom of his family, he made that drink a mighty generous one. This meant very few drinks to the bottle, and loss to the club. The New York man, on the contrary, expected to take very many drinks in the course of the afternoon and evening, and consequently his measure of liquor was exceeding small. This meant very many drinks to the bottle and gains for the club.

It is highly probable that the recollection of the simple days when the dinner hour was three o'clock, and supper was the form of entertainment in vogue, is very much pleasanter than their actual presence would be, now that civilization has taught its sons and daughters to expect so much more. Boston grew out of the old times. When Mrs. Harrison Gray Otis set up the afternoon tea for admirable reasons, European customs were admitted into the Puritan circle, and business places and homes becoming more and more estranged and distant, down-town mid-day lunch was established, and dinner was served in the evening. Besides growing larger and more modern, Boston was growing richer, and the younger and more fashionable members of the Temple Club wanted an establishment more on the scale and after the manner of the famous institutions of Pall Mall. Out of the Temple Club, which still exists, therefore, in 1852, grew the Somerset, which took its name from the street on which stood its first club-house. This had been a private dwelling belonging to one of those antique citizens having so strong a will of his own as to undertake to control his homestead after he had departed, let us hope, for his mansion in the skies. The particular burden with which he charged his heirs was the maintenance of the court-yard in front of the building. The Somerset Club was to Boston what the Union Club was then to New York, and this testamentary clutch on their privileges was too much for the young men, who envied the splendid opportunities furnished by the bow-window of White's. At last the trustees found a legal blind alley up which they conducted their grantors. It enabled them to sell the house to the Congregational Society, who have since blotted out the court-yard, doubtless with the club's law point. The sale was made when two beautiful granite houses belonging to the Sears family were in the market, and these were bought, and being thrown into one, are still occupied by the club.



A SMOKE TALK AT THE ST. BOTOLPH.



THE ST. BOTOLPH CLUB

The property has always been in the best society. Before it was owned by the Searses it belonged to Copley, that most fashionable of last century portrait-painters, and here stood the house in which he dwelt. It has seen many a rout in its day. The seal of well-born Boston is on it, and, for old associations' sake, it is to be hoped that for years to come the club will continue to occupy the noble building, so suggestive of Boston at its very best. Its huge swell fronts are now covered with the Boston ivy, both the swells and the plant being characteristic of the city. The club is not intellectual or literary or artistic. It is a place where its members spend their idle hours; where they have the comforts of an excellent restaurant; where a man can be pretty sure of a good game of whist; where one may lounge to his heart's content, and listen to and share in the talk which engages the minds of the men about Boston town. In short, the Somerset is a club after the model of the best of its kind, with the infusion of the spirit of Boston. In its list of members are family names that have been honorably known in the city for generations—of men who have given the city its rank in the history of the country.

If one should ask what it is that most especially sets apart Boston, and gives a unique tone to its spirit, the answer is that which made Athens most interesting among the cities of the Grecian League—the eager interest of all the citizens in the municipal life. This is the true foundation of that self-respect which is so often mistaken for pretentiousness and boastfulness. There are very few citizens, even of the youngest generation, so degenerate as to be uninterested in municipal elections, in street pavements, in the quarrels of local magnates, in yachting, in the parks, in the altercations between the police and the preachers on the Common, in the condition of the water at Chestnut Hill or the frog pond, in the Symphony Concerts, in the Fourth of July regatta, in the fight for the control of the Democratic City Committee, in the cost of the latest Aldermanic funeral junket, in the occasional theological outbursts that still agitate the two branches of the Congregational Church, in the rate of taxation, in the question of the identity of the author of the last anonymous novel, or in the relative merits of the industrial arts, Concord philosophy, and cookery as subjects for instruction in the public schools. It is true that one does not always hear these subjects, or any of them, discussed in Boston society, or at the Somerset Club; but it is true that there are a great many more people interested in these and kindred topics in Boston than can be found among the comparatively idle classes of any other city in the land.

It is hardly fair to speak of the idle class of Boston. The city is very rich, and there are many people in it who are not in active business or professional life, but there are very few who do nothing but amuse themselves. Even those who do spend their time in the search for joy have enough of the spirit of Eolus in their nature to prefer a yacht that is managed by sailor-men to any that is run by stokers. There are no better yachtsmen in the world than those who hail from Beacon Street and the Back Bay, and are to be found from early summer until late autumn on the sea or at the handsome home of the Eastern Yacht Club on Marblehead Neck. Was it not from among these followers "over the swan's road, over the whale's bath, over the long snake's leap," that the Vikings came who built the last three cup defenders?

As a rule, however, as has been already said, the Boston man is busy. If his father was famous in the city, he is regarded reproachfully by his fellow-townsmen if he does not add some honor to his inheritance. Therefore he opens a law office, or tries his hand at literature, or becomes a physician, or goes into politics. He may ride steeple-chases at the Country Club, or he may go to other extremes in sports and athletics, the temptations to which are stronger, or at least more concentrated, in Boston than anywhere out of New England; but he tries to do some real work in the world, and even if he accomplishes nothing of material value he at least makes of himself a more interesting man. This exaction by society, and this sentiment of those who might be, if they would, such gilded youth as nightly stormed the streets of degenerate Rome, mark Boston, not because they do not exist elsewhere, but because they are so nearly universal there as to change the social atmosphere into an ambition that is at least infrequent in the fashionable society of other towns. Boston has its worthless rich as it has its helpless poor, and they are not only tolerated, but are not ostracised. Bostonians, however, being very proud of their city, expect every one who has enjoyed the inestimable privilege of being born on one of its seven hills, whether it be the aristocratic Beacon or the lowly Fort, shall do something for the glory of his native town, and this local spirit is finely stimulating, making social life from the top to the bottom of the scale much more interesting than modern life usually is. And one finds at the Somerset Club, and especially among its older members, more than in any other club of the city, the honest pride of a Boston older than the city of to-day—a pride which has for its subject and object more than the achievements of this year or last year, and which venerates and loves historic Boston as a priceless part of the family possessions.

There is a delightful feature of the Somerset Club which is also the outgrowth of Boston's life. To a Bostonian a club is as essential as it is to a Londoner, and the city being compact, the clubs are near enough to the business parts of the town to make their restaurants available for the mid-day luncheon. One of the most faithful of club men has broached the very likely theory that the club restaurants of the city are so good that there are very few other bearable restaurants. From this it follows not only that the Boston man who has no club is the most unfortunate and unhappy of created beings, but that his fate is shared by the Boston woman whose husband, brother, cousin, or, in the language of the common law, next friend is not on the list of some institution with a culinary artist. And does the Boston woman need a down-town restaurant? Ay, marry, that she does, for—and now we come to speak of one of the most grievous sins by which this goodly town is beset—the more highly bred a Bostonian, the more of a tax-dodger he is; and this is true not so much because he does not love his native city, or because he is penurious, as because the municipal government is in the hands of those whom we are wont to call, when we stray into politics, "our foreign-born fellow-citizens." From very early in the spring until very late in the autumn the rich Bostonian lives in the country, near enough to enable him to reach town every morning comfortably. His wife and daughters are also compelled, by the demands of their wardrobes and for other purposes, to make frequent visits to town, and so the Somerset Club early established a restaurant for these partners of its members' joys, whither they might have their parcels sent, where they might meet their natural protectors, and enjoy in that congenial company the exquisite delights of the club cuisine.

It ought to be unnecessary to state that club law and custom are so observed at the Somerset that this gracious bit of hospitality has not been made an opening for the introduction of women into the principal part of the establishment, which is reserved, as long may it be, for men alone.

There are two cities that have very distinctly marked physical social boundaries. There is a vast number of poor Philadelphians and Bostonians who pinch themselves and deprive their families of the necessaries of life in order that they may live outside of the prohibited borders. Partly to avoid moving to the South End, Boston built its Back Bay district by filling in the lands that the falling tides left bare. Thus Beacon Street was extended, and Commonwealth Avenue was created. The region in which fashion might reside, in which visits might be paid, was greatly widened, and the happy spaces that once were river-bottom urged their artful attractions upon all who had the means of purchasing them. There was a rush to get within the widened but still charmed circle. Many who had been cramped in the narrow confines of the original Beacon Street and its circumjacent thoroughfares, and many who had been content to dwell at the South End, reared their stately edifices on Commonwealth Avenue. There was a new infusion of blood in social Boston, and at last it has come to be recognized that all the clubable good fellows of the city are not to be found in the old families. The growth of opportunities and wealth is constantly going on in this republic, and is as constantly making old traditions, so far as they concern names and families, less sacred. Notwithstanding the admirable sentiment to which we have done full justice, the aristocracy of Boston, like everything else in nature, is the better for an occasional supply of new blood and new energy. Here, as everywhere, there is the temptation to the vain pursuits which lead to the weak-mindedness of inanition, very strong with those who are not under the necessity of doing something for the solid rewards of industry. Although the tone of the general atmosphere is exhilarating, there is sometimes a miasmatic influence. Although the British aristocracy is, on the whole, a sound and wholesome body, there is an occasional noble lord who marries a concert-hall singer, prefers rat-baiting to the performance of his inherited legislative duties, grinds a hand-organ, and figures in the police courts. Is it to the credit of Boston or not that few, very few, of its youth who are born with silver spoons sink so low as the bad eggs of the British peerage? Perhaps it is because in this country opportunities are not presented to infants at their birth, but must be striven and worked for. It is, after all, very difficult to feel much confidence in the potency of names and family traditions when we find the heirs of old houses in the rags of their own vices, and the descendants of the poor and humble toilers of a generation or two ago in the lead of all that is good in the city.

So Boston has received in its social kingdom from time to time new names, the men who have made them respected coming first, and the rest following. There are two clubs in Boston which exist because the Somerset and the Union were full. They are the Puritan and Algonquin. The former is composed mainly of the very young men who will eventually come into the Somerset. The latter is made up of members of the Somerset, the Union, and all the other old clubs of the town, and of new men who have been gradually broadening Boston's social life. This most recent of the clubs of Boston has reared its dwelling—the most beautiful in American clubdom—

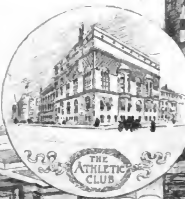
on Commonwealth Avenue. Although it is the youngest, it is naturally spoken of in connection with the club which represents the oldest society of the city, because it quite as well represents the society of to-day and of the future. The people who are moving upward on the ladder will some day or other reach the top. Whether they will raise or lower the average is a question which may well be left for the discussion of local gossips. One thing is certain, the amalgamation illustrates most completely existing municipal life and activity. There invariably comes a time to every man who rigidly draws the line between his business and his social relations when he must receive into the one those whom he has leaned upon in the other.

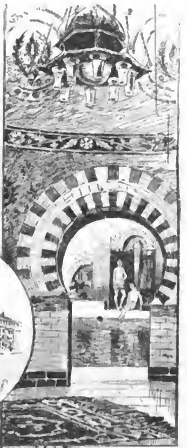
It must not be understood that the standard of the Algonquin is not high. It simply does not represent old Boston. Its basis is social, but its spirit is that of the most recent times, into which old Boston has fitted itself with all the adaptability of the New-Englander, and the club will live and prosper because it is nearer the newer homes of the city. It is not a protest; it is an outgrowth of new and changed conditions that have come about so gradually that they are hardly recognized by the people most affected by them.

It may seem odd to a Bostonian that in all this discussion, if it may be so gravely designated, nothing has been said of the Union, most charming and agreeable of clubs. This is simply because it is less peculiarly Bostonian than the others, and is nearer akin to the outside world. It is solid, active, professional, work-a-day Boston. When it was founded it was one of the chain of loyal clubs that were organized during the war in the great cities, and continue to exist as Union League clubs. There is consequently a political element in the Union Club, but it is not so apparent and emphatic as in the similar institutions of New York and Philadelphia. The Boston Club is the favorite of lawyers, and there is altogether a busier, more active, more intellectual life there than in the clubs that are dominated by men who have social ambitions or positions. The Boston lawyer is very much like his professional brother of New York, but he differs in one very important respect from a certain product of recent times. He has not yet established the great law emporium, which is to the old practitioner very much what the modern retail shop with its innumerable departments is to the old-fashioned merchant. The Boston lawyer is interested not only in something besides the gains of his practice, but in something outside of his profession. A group of dining lawyers and business men discussing the latest novel or the newest play would be exceptional outside of Boston, but it is rather to be anticipated at the Union Club. And the dinners are so good! Why is it that politics and cookery go together? It was in the kitchen of the Reform Club of London that Soyer laid the foundations of a fame which he made immortal in his quaint literature full of French idiom expressed in Cockney English grammar. The Union Club does not own a Soyer, but it rents a Frenchman no doubt, whose idioms are probably clothed in sound Bostonese. At any rate, he cooks well.

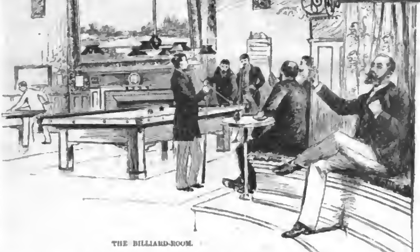
To the outside world, Boston's crown of glory is its literary achievement. We may laugh at Boston culture, as though it were a flimsy affectation, but the fact remains uncontradicted and indisputable that the prevailing color of the Boston eye is blue, which, according to Homer, is the hue of Minerva's far-seeing orb, while recent experiments have demonstrated that the blue eye is a sign of the highest civilization. It is true enough that the writers of books are seeking the richer marts of commerce, and that the Athens of the New World can no longer display the longest and best list of contemporary American writers, but the glory of its old names—the names of men who lived when it held the first rank—is undimmed, and the only club in the country which approaches the St. Botolph is the Century, of New York. In some respects the St. Botolph is unique. It is a club of workers and amateurs in literature and the arts, and in no other city is there so much sympathy between the two. There are men who are filled to the brim with Puritan blood and traditions, and who accept and maintain the social place to which nature and Boston have assigned them as a grave and serious duty which they must fulfil as they fulfil their duties to the State and the family; but they find their pleasure among the makers of books and pictures. This has always been so; but when an eminent Puritan snob asked an artist who was doing him the honor to paint his portrait, why he did not go out into one of the neighboring villages, and find a wife of his own station among the daughters of the well-to-do country merchants, he simply indicated the feeling of Boston of a generation or so ago. The story is now told at the St. Botolph, of which its participants are members, as a good joke.

Does it astonish the denizens of an unlettered metropolis to learn that literary men were not always of the highest fashion in Boston? Was not Longfellow and are not Lowell and Holmes at the very top notch of society? That this is true is not due to any of their literary accomplishments. Their professorships in the university and other virtues of kinds beloved by the Brahmins and their wives, opened the doors of houses that were closed to George Ticknor, scion of a grocery firm, until he gilded his gold with Spanish literature. In the olden and severer time a *littérateur* from abroad—for example, the late Mr. N. P. Willis—might be entertained as a stranger of temporary interest by those who would not concede hospitable rights to natives who had achieved only wealth or literary notoriety. But when the two were joined together! After all, is it not true that in our own broader and more catholic spirit our admiration for a possessor of wealth is increased if he has also acquired intellectual accomplishments? And do we not feel an added respect for the literary man who has had the shrewdness and common-sense to fill his coffers? We can certainly discern in our own minds the remnants, at least, of the sentiments that were entertained toward literary men by the thrifty world of half a century ago. If there is doubt of the truth of this, it may be well for the doubters to inquire as to Hawthorne's experiences among his old neighbors of Salem.





THE TANK FROM THE BATH.



THE BILLIARD-ROOM.

Writers and artists have been always tolerated in Boston, but they did not make the figure that they happily do now among the people who bear the names of pursuers of Quakers and witches and of Revolutionary patriots. Scholarship is one thing and genius is another. The one has always been respectable in a community over which the preachers once presided; but genius was too often afflicted with habits of which properly born and brought up citizens could not approve.

How immeasurably long is the distance from the old Boston to the new is shown by the emancipation of cleverness. The people who give Boston its individuality are the inheritors of its traditions and the possessors of its modern intellectual activity. They are not necessarily clergymen or rulers in the city. Out of the narrow and austere past has come a very much brighter and more wholesome life, as much the product of the former seriousness as the modern educational spirit of New England is the outgrowth of the theological discussions that resounded through the seventeenth century. Naturally there was a long period during which cleverness felt its slow way out of the shades of timid respectability.

It was probably in the picture-gallery of the Art Club that there began the companionship of the men who work in art and letters and those who might if they were only poor enough. The Art Club is now about to have a handsome home in one of the most fashionable neighborhoods of the town; and one of its presidents has been a Governor of the commonwealth, whose boast is that there has never been within his domiciliary walls a drop of distilled or fermented liquor. What is the potent charm of an art gallery? Why is it that the place where pictures are exhibited and sold was for so many years the border-land of Bohemia into which Philistinism entered? Can the slight and often fugacious and disappointing spirit of commerce be the connecting link?

At any rate, Boston having once admitted the supremacy of cultivation, the conclusion naturally followed. They whose duty it was to preserve the graver studies of scholarship bred in themselves and in those who came under their influence a desire for letters in their lighter and gayer moods; and this being so, we have the comradeship of the amateurs and professionals in the Papyrus and the St. Botolph clubs. But the Papyrus is only a dining club, at which visiting strangers are fed and talked to, usually by wits and occasionally by bunglers. The St. Botolph began house-keeping in old-fashioned Boylston Street. Its first president was Francis Parkman, and its second General Francis A. Walker. History and science have watched over and guided an institution in which John Boyle O'Reilly found comfort and satisfaction when he sang:

"I'd rather live in Bohemia than in any other land;
For only there are values true,
And the laurel's gathered in all men's view.
The prizes of traffic and state are won
By shrewdness, or force, or by deeds undone;
But fame is sweeter without the feud.
And the wise of Bohemia are never shrewd."

THE INFANT KING OF SPAIN.—From the Life-size Portrait made Two Years ago by F. Domingo.—[See Page 75.]

A NOTABLE FRENCH NOVEL.

THE CRIME OF SYLVESTRE BONNARD (Member of the Institute). By ANATOLE FRANCE. The Translation and Introduction by LAFCADIO HEARN. 8vo, Paper, 50 Cents. No. 665 in *Harper's Franklin Square Library*.

Although M. JULES LEMAITRE, the distinguished French critic, declares "I love M. ANATOLE FRANCE'S stories so much that it is hard for me to analyze them," yet he once succeeded in describing the varied charms of *The Crime of Sylvestre Bonnard* in the following admirable manner: "This book will appeal to mothers, because it concerns children. It will charm women, because it is delicate and pure. It will entrance poets, because it is full of both the subtlest and most natural poetry. It will please philosophers, because the reader constantly notes in it the mien of serious thought. It will be esteemed by psychologists, because they will find in it the emotions of a simple soul most minutely described. It will gratify classicists, because it breathes passion for polite learning. It will fill tender hearts with rapture, because it is full of tenderness. And it will find grace in the eyes of cynics, because it has a vein of irony, and more of the spirit of resignation than of optimism."

HARPER'S FRANKLIN SQUARE LIBRARY

New Issues. 8vo, Paper Covers

THAT CLASS OF AMERICANS CALLED AFRICANS.

SENATOR MORGAN, like all thoughtful public men in the Southern States, is perplexed by the negro problem, and proposes in effect the return of the colored citizens to Africa. It is not unnatural that those who hold that there is a fatal difference between the races, and that they can never mingle as equal citizens, but who bear the colored people no ill feeling and wish them well, should desire a separation of the races as the only solution of the situation, and that those who were in the beginning involuntary immigrants should go. Senator MORGAN perhaps is not aware that the first anti-slavery work published in this country was called *An Appeal for that Class of Americans called Africans*. It was written by Mrs. Lydia Maria Child, and was published in 1833. The essay exposed and emphasized the fact, which the colonization movement had entirely overlooked, that the great multitude of the colored laborers of the Southern States were no more Africans than the white planters were Europeans. Their ancestors may have come from Congo, as the ancestors of eminent New-Yorkers came from Holland. But the New-Yorker is not a Dutchman, and the colored South Carolinian is not an African.

This is a fact which is incontestable, and as Senator MORGAN will see, it is full of consequences. It would be, for instance, hardly a practicable undertaking for New York to return all her Yankees to New England, or her Germans to Germany, or her Polish Jews to Russia and Poland, or even her Irishmen to Ireland. Their coming, like that of the Chinese, might have been prevented, but their enforced going is now impossible. Americans must make the best of it, and while the older comers are already Americans, we must turn the new comers into good Americans as fast as possible. There are other views of this proposition of extruding the colored people from the country, which, although it seems whimsical, is yet seriously pondered by excellent men in the Southern States. In his Boston speech, which was Mr. H. W. GRADY'S last public word, the ardent Georgian said:

> "We give to the world this year a crop of 7,500,000 bales of cotton, worth $450,000,000, and its cash equivalent in grain, grasses, and fruit. This enormous crop could not have come from the hands of sullen and discontented labor. It comes from peaceful fields, in which laughter and gossip rise above the hum of industry, and contentment runs with the singing plough."

That is a pleasanter and more charming picture of Southern fields than Mr. OLMSTED was able to paint forty years ago. Is there no promise in it? Is it the cheery and contented labor which produced last year this enormous crop and its princely revenue that Senator MORGAN would exile to Africa? But Mr. GRADY continued:

> "I present the tax book of Georgia, which shows that the negro, twenty-five years ago a slave, has in Georgia alone $10,000,000 of assessed property, worth twice that much. Does not that record honor him and vindicate his neighbors?"

No such glowing account as Mr. GRADY'S has yet been given of the material prosperity and happy content of the colored people in the Southern States. The details are surprising to the great mass of readers in this part of the country. If Senator MORGAN could expatriate these native laborers, who are now, according to Mr. GRADY, happier than ever before—thrifty, progressive, zealous for education, and of constantly developing intelligence—how would he replace them? The scheme of expatriation is absolutely impracticable. The problem of the races in the Southern States is not to be solved by separation. That ought to be frankly and finally acknowledged, and the notion finally discarded. The solution, whatever it may be, must be based upon the postulate that the two races make a common people. The root of the difficulty is not industrial, but political. It is the ignorant ballot of "an inferior race" which Senator MORGAN would escape. But upon this point the Charleston *News and Courier*, in response to Professor PHELPS, of Andover, who asked in the *Congregationalist* whether Georgia, having educated the colored citizen up to the level of the Republican ballot in Massachusetts, would count his vote if it would elect, says, "Whenever an intelligent and reasonable ballot is cast by black hands, the South—South Carolina and Georgia—will count it as truly and honestly as Massachusetts." That is a complete answer to Professor PHELPS, who concedes that in the actual situation of Georgia, Massachusetts would do what Georgia does: only, he says, she would do it legally, without, however, stating how. But when the *News and Courier* asks whether its answer is explicit enough for every inquirer, we ask, in turn, does it think that it is? Who is to decide what is an intelligent and reasonable ballot? The inspectors of election? In New York we submit to the decision of ballots which we believe to be both ignorant and unreasonable, and sometimes even corrupt. We do so because the law defines the qualification of voters, and authorizes the majority to decide. If only the ballots which the *News and Courier* would consider intelligent and reasonable were counted there would be trouble.

A NEW SENATOR.

THE intention of the Constitution in creating the Senate was to provide a select body of men which should serve as a deliberative check upon the larger body of Representatives, thus securing ample consideration of all measures of national legislation. It was of course assumed that as but two Senators were to be chosen from each State, they would be men of signal distinction for public ability, experience, and intelligence. Such a man, for instance, is Senator SHERMAN, of Ohio. He is essentially a public man. He has proved his admirable capacity in high executive as well as legislative office. Unhappily he has been too intense a partisan, and has vainly sought to gratify his ambition by pandering to party spirit. But he is unquestionably one of the most eminent of public men now in active life, and an honor to the State of which he is a Senator. No intelligent American would deny that he is the kind of man of whom the framers of the Constitution supposed the Senate would be composed, and of whom his State may be justly proud, whatever differences of political opinion may exist among his constituents.

His State, however, has just given him a singular colleague. It was fair to suppose that Mr. SHERMAN'S political opponents, controlling the Legislature of the State, and desirous of elevating the prestige of a party long discredited, would select a colleague for Senator SHERMAN who by public character, ability, and service like his, or as nearly as might be, would have helped the effort of patriotic Democrats to regain for their party the confidence of the country. If Mr. BRICE, the Senator selected by the Democrats, has any especial qualification for the Senate, it has not been made public. He is a resident of New York, and if Ohio preferred to select a Senator from this city, it would seem that there must be some plain and decisive reason for so unusual a course, which would at once answer the wondering question which the selection of Mr. BRICE instantly excites.

No such reason, however, has been suggested. Yet it is the universal belief that had he been a poor man, Democratic Ohio would not have come to New York to take him for a Senator. In the same papers in which his nomination by the caucus was announced, it was stated that the late Republican Governor of Massachusetts, if he should wish to do so, might contest successfully at the next election the seat of one of her Representatives if he would pay $50,000. There was no hint that his character, ability, and public service without $50,000 would be of any avail in the contest for this public trust. It is not by such facts that the happy progress of popular institutions is illustrated or that high anticipations are justified. The defence of the Ohio Democrats which is offered by sensitive friends, and which consists in the assertion that nobody can prove corruption against the new Senator, is merely an insult to him. Why is corruption mentioned? Was it ever charged in the election of SUMNER, of FESSENDEN, of CHASE, of SEWARD, of THURMAN? Let it be conceded that the new Senator is a skilful party manager like Senator QUAY. Does any intelligent man believe that it is even a substantial party advantage to select such Senators, instead of such as we have named, or that any party can long maintain itself by management of the addition, division, and silence school?

TIMELY HINTS.

A CORRESPONDENT in Pittsburgh thinks it singular that the friends of ballot reform in New York have not exposed the utter weakness of the HILL-GORMAN argument that the reformed ballot law disfranchises illiterates. He points out that the objection lies against any system of voting in which printed ballots are used. A voter who cannot read must, under any system, necessarily depend upon some one who can read to select his ballot. At present in this State he depends for that service upon the ward "heeler" or the district "hustler"; and whenever it is the interest of these worthies to deceive him, they do so without the slightest compunction. Under the Australian or reformed system, and this is one of its strongest points, the illiterate voter is assisted by a sworn officer instead of a boss's heeler, and is thus protected from deception and imposition. Nothing can be clearer or simpler than this truth.

A correspondent in Maryland admits that the immense improvement in the methods of election which will be secured by the reformed system is undeniable. It has been already amply demonstrated, and can no longer reasonably be disputed. But he adds that the new system, while preventing the usual bribery or buying voters to use a particular ballot, does not prevent buying voters not to vote at all, which is a point well worth consideration. At present a voter of any one party can be bribed to vote for the candidate of the other party, thus practically securing two votes for every voter bought by the briber, and under the reformed system this double count will be stopped. But the briber will then resort to the next best thing, bribing the voter not to vote at all. In such a bargain, even under the reformed law, the briber can satisfy himself that he receives the consideration. Undoubtedly the absolute result of such bribery will be less satisfactory than under the present positive system of buying a vote, but the conditions for both sides are so easy that it is fair to assume that the number of vote-sellers will largely increase. It is easier for a man to agree not to vote than to vote against his party, and the bribe is more seductive when the bargain is negative, consisting in escape from the discomforts and jealous scrutiny and inquiry at the polls, and in securing a day of leisure for unwatched enjoyment. Thus bribery or vote-selling in this form will continue even under the reformed system, signal as the improvement of that system will be. Our correspondent suggests, therefore, stronger laws against vote-buying in every form.

Such laws, he thinks, should exempt the bribe-taker from all penalty, and place it wholly upon the vote-buyer, as has been often proposed. The need of such laws is increased just in the degree of the extent of pecuniary interest in the result of an election. In a country where only the candidate or his agents are thus interested, secret voting may substantially put an end to vote-buying. But where the entire civil service has a vital pecuniary stake in the result, and a candidate's expenses are unlimited, and no account of election expenses is required, the situation is very different. The corruption fund will be always enormous when the whole civil service is put up as the prize of the election. The suggestion of our correspondent is timely, and fortunately there is little doubt that the same good sense which secures the reform ballot law will remedy its defects as they appear.

BLOCKS OF FIVE.

SENATOR EDMUNDS is a man of plain speech and impatient of shams, and it is very easy to understand his restiveness at a lecture upon honest politics from Senator VOORHEES. The latter gentleman's conduct and attitude during the war, as they are generally understood, were not such as to conciliate the prepossession of old Union men, and the party of which he is a distinguished member, and which has just selected a Senator in Ohio, is not in a position to reprove any other party for corrupt motives and methods.

All this may be fully conceded. But because there is unquestionable corruption in both parties, is nothing to be done? Because Indiana, according to high Republican authority, was carried by "soap" in 1880, and because "floaters in blocks of five" were probably "voted" according to Republican instructions, or without instructions, in 1888, must we all quietly submit to have our honest votes neutralized by scoundrels unless Republicans in good standing call attention to the facts? And must it be George F. Edmunds who suggests, what nobody believes, that perhaps the Dudley letter was a forgery? No man in the country has pointed out more clearly or denounced more strongly than Mr. Edmunds the consequences of a corrupt use of money in politics, and what can possibly be a worse consequence than that party spirit should incline even him to treat the matter gayly or indifferently?

It was fair for a Republican to strip Mr. Voorhees's proposition of all details which were designed to serve a mere party purpose. But it was unfortunate for an honest man and a true patriot like Mr. Edmunds to obstruct in any way or degree as a partisan an inquiry into one of the most flagrant acts of a kind which Mr. Edmunds has severely condemned as essentially fatal to free institutions.

STATE ROADS.

In the midst of Governor Hill's recent message there is a recommendation of great public interest which is worthy of careful attention. Reminding the Legislature of what its rural members know only too well, that country roads are generally in the most unsatisfactory condition, often impassable during large portions of the year except with great discomfort, and seldom kept in proper repair, the Governor states that, bad as they are, they are getting worse, and that some adequate remedy should be devised. The roads of a State, he holds, while a local convenience, are in a broader and more comprehensive sense a public convenience for the people of the whole State, and he thus leads up to his suggestion.

This is that the State should construct in every county two roads intersecting each other in about the centre of the county, connecting with similar roads in the adjoining counties, and so forming a system of State roads to be thoroughly made and maintained at the expense of the State at large. This would secure rapid, prompt, convenient, and comfortable access for all the citizens of the State to every part of it, however remote and secluded, while the excellence of the roads would stimulate every community to emulate them in constructing the ordinary local highways.

The project opens halcyon prospects to the rural citizen, and the Governor does not apprehend serious opposition from the residents of cities. Precedents for such action he finds in former liberal grants of the State for such objects, and in the State aid given to the free canals and to the construction of certain railroads. The local objections to canal and railroad grants would be obviated by the fact of the universally diffused benefits of the proposed system of roads. Many years would be required for the completion of such an enterprise, and before any debt should be contracted the wishes of the people of the State would be ascertained in accordance with the constitution.

MR. LEA'S HISTORY OF THE INQUISITION.

Mr. Henry C. Lea's great work, *The History of the Inquisition of the Middle Ages*, is one of the triumphs of American scholarship, and it has been received abroad with an interest and respect not often accorded to an American work. This, however, is not surprising, for it is concerned with the history of every Continental nation from the twelfth to the sixteenth century, thus traversing ground which has been the object of earnest study by native scholars of all lands, and discussing points which have always been subjects of bitter controversy, yet everywhere the portions selected for special praise are those with which the writers are most familiar.

An enlightened Catholic of immense learning, like Lord Acton, in the *English Historical Review*, is particularly impressed with its impartial presentment of facts and exhaustiveness of research. Professor Bernhardi, in *Sybel's Historische Zeitschrift*, regards its treatment of John Huss and the Hussites as worthy of special commendation. M. C. V. Langlois, in the *Revue Historique*, pronounces the chapter on the trial of the Templars as the best account of that catastrophe yet given to the world. Professor Édouard Montet, in the *Annales de Bibliographie Théologique*, selects the portion devoted to the Waldenses as peculiarly deserving of praise. Professor Tocco, in the *Archivio Storico Italiano*, lays especial stress on its ample treatment of Italian affairs and the new light shed upon them by its hitherto unpublished documents.

Each scholar seems to be impressed with that part of the work to which his own studies have been devoted, thus fulfilling the forecast of the *Saturday Review*, "that his work will be valued in proportion to the knowledge that his readers already have of the period on which he writes."

A GOOD REPORT.

The annual report of the Civil Service Commission of the State of New York contains some very interesting and significant facts. They are official statements which are of more importance than the loose allegations of the professional politicians, who hate the reformed system because it deprives them of chances to bribe by patronage. The number of non-competitive places in the State service, such as attendants in asylums, prison guards, etc., who are required to write and to know the fundamental rules of arithmetic is 2469. There are 410 places to which the competitive system applies, and there are 217 excepted altogether.

No complaint has been made that the examinations are not fair tests, or that they have not been fairly conducted. Heads of departments testify uniformly to the ability and efficiency of the persons selected by examination, and the evidence is ample that the character of the employés holding minor places has greatly improved during the last few years. Such facts as these attested by the Commission are incontrovertible evidence of the advantage of the reformed system to the State, and they justify the remark which the late head of the Commission, General Sickles, is understood recently to have made, "My own belief is, after two years of careful observation, that the civil service law and regulations, fairly administered, will commend the system of appointment to general favor among the people of our State." It cannot be denied that such an opinion from a man long and intimately familiar with "practical politics," who can have no motive but to say what he honestly thinks upon the subject, is very valuable and significant.

During the year there were 821 persons who were found qualified upon examination. Of these, 199 were in the competitive schedule, and 622 in the non-competitive. Of the former, 47 were appointed, and all of the latter. Of the 199, there were 96 who had studied in the common schools only; 46 in the academies; and 15 in the colleges. This fact shows that the common school, and not the college, is the great recruiting-ground of the service. If eligible lists are found generally to be too large, they can be diminished by raising the minimum standard, because the State is entitled to the best qualified servants. Doubtless with larger experience the whole system will be improved in details, and for its suggestive facts the report of the State Commission is one of the most important and interesting public documents of the year.

THE NEW CITY BUILDING.

The rivalry among newspapers is now so searching and alert that the growing disposition to resent the intrusion of reporters into the concerns of private life, and to disbelieve statements for the very reason that they appear in the newspaper, is not surprising. But when all exceptions are allowed, the value and force of the press as a public eye and voice were never so plain. One of the most recent illustrations of this truth is the arrest of the scheme for devastating the City Hall Park by the erection of certain new public buildings. The omnipresent press suddenly exposed the scheme, like a detective turning his lantern upon a thief. The facts and details were laid before the public, and a public opinion was at once aroused which called a halt.

The last Legislature authorized the erection of the buildings. But the public protest made by the press has arrested action, and the Mayor now states in his message that the Commissioners have decided to wait before proceeding until the Legislature has had time to amend or to continue the existing law. The Mayor also hopes that public opinion will assert itself so plainly that the settlement may have the sanction of a clearly expressed public judgment. Nothing is more desirable, and that judgment has been already clearly expressed.

Not only the unanimous voice of the press, but the hearings in the Mayor's office last September have manifested unmistakably the feeling of the city. If that feeling is honestly and adequately represented at Albany, there can be no misapprehension on the part of the Legislature. The shutting up of any of the remaining open space in the park, which is now both healthful and ornamental, would be a serious blow to the city. Space for the new building can be found elsewhere, and the present hope and expectation are that the Legislature will prohibit its erection in open grounds which should be kept open for the benefit of the city.

ENGLAND AND PORTUGAL.

In the political excitements of this century in Europe the students of the universities have always played a prominent part. During the Napoleonic wars in the beginning of the century the German students did much to support the patriotic leadership of Stein by arousing popular enthusiasm, and the Russian students are always more or less "suspect" by the police agents of the government. Freedom is the university tradition, and a sudden political movement of students is generally republican. They serve as ringleaders of the mob, as just now in Portugal, where they parade the streets of Lisbon denouncing the British government, accusing the Portuguese ministry of cowardice, and veiling the statue of the old Portuguese navigators in black as a sign of national mourning for national humiliation.

Great Britain has sent an ultimatum, and Portugal yields under protest. According to a circular note of the Portuguese government, the English ultimatum was unmannerly, and was despatched upon a mere newspaper rumor that a Portuguese major in the interior of Africa had disobeyed certain instructions sent to him in consequence of a note from England, the fact being that the major had not received the orders and consequently had not disregarded them. Meanwhile the students cry "Down with England" and cheer for Major Pinto.

There will be no war between Great Britain and Portugal. The dispute is over a question of alleged territorial rights in Africa; in other words, it is a conflict of interests in a region where "rights" depend upon the strong hand, and as no other great power has interests enough in the region to care to interfere, the only result may be one which is not cognate to the situation, namely, to strengthen republican feeling in Portugal. There is a republican party organized in the country, and whatever can be made to discredit the monarchy will naturally foster republican sentiment. But there is no general evidence of any national readiness for a republican revolution in Portugal.

MR. THOMAS AT THE LENOX.

Mr. Theodore Thomas has begun with great success a series of concerts in the Lenox Lyceum, which is designed to be popular in the best sense, that is, of music which is at once good and generally pleasing. Of the higher range of such music is the Eighth Symphony of Beethoven, which was played incomparably at the last Philharmonic Concert, under the direction of Mr. Thomas. It may be safely said that no audience which would be attracted to the Thomas popular concerts at the Lenox but would be delighted, especially by the second movement of that symphony.

The secret of general popular attractiveness in music is undoubtedly a marked and simple melody in the Mozart and Beethoven sense, played with the precision and effect which distinguish Mr. Thomas's leadership. But the melody need not be slight or trivial, and the whole work, or the work from which it is taken, may be a classic. The delight of the Philharmonic audience in what our critical friends call that "number" of the concert was spontaneous and evident. It was not the pleasure of students only, nor of connoisseurs, nor of a school or a fashion in music, but the instinctive pleasure with which any form of beauty is recognized and greeted.

At the Lyceum, as at the Philharmonic, Madame Clementine de Vere has proved herself a remarkably accomplished singer, with a true and fine voice. Her ease and security of vocalization and her quality of tone are alike charming, and few concert singers have recently attained a more unquestionable success. Mr. Thomas has demonstrated that the great and acknowledged masters of music need not be barred from truly popular concerts, and it may be well asked whether that movement of the Eighth Symphony will ever lose its charm for the musically susceptible ear.

THE LATE MR. WALKER BLAINE.

It is conceded on all sides that the late Mr. Walker Blaine was a man of unusual ability, and of a public training which promised a distinguished career. He was his father's confidential friend and counsellor, upon whose judgment Mr. Blaine gladly relied, and of whose qualities and prospects he was justly proud. In social and official intercourse Mr. Walker Blaine is described as urbane and gentle, with a tact and charm that won for him in all circles a cordial welcome. In the sore bereavement of his son's sudden death the Secretary of State and his family will receive universal sympathy.

PERSONAL.

The late Congressman William D. Kelley was an inveterate smoker and chewer of tobacco till within the last few years of his life, but the appearance of a cancerous growth in his cheek, and the warning given him by the death of General Grant, led him to give up the habit to which he had been attached for over fifty years.

—Rev. John Jasper, of Richmond, Virginia, the colored clergyman who won fame by his sermon, "De Sun do move," has just preached the sermon for the one-hundred-and-seventy-fifth time. He is growing old, but his fifty years of preaching do not seem to have lessened the vigor with which he presents his favorite themes. Till the close of the war Mr. Jasper was a slave. His present church, although not organized till 1867, now has two thousand members, who worship in a handsome edifice. Next to his preaching, the pastor prides himself on his skill in officiating at baptisms, and it is said that on one occasion he baptized three hundred persons within an hour.

—Clara Morris when a girl acted minor parts in plays where John Wilkes Booth was the star, and has taken up the cudgels quite vigorously in his defence against recent published statements that he was commonplace in his acting and a bravo in his general life. Miss Morris believes that he, more than any of the other sons, possessed the genius of his great father, and says that to his inferiors in the profession he was always gentle, considerate, and kind.

—Devotion to duty and an exceedingly kindly spirit marked the life of the late Stephen A. Hubbard, who was for twenty-three years managing editor of the Hartford (Connecticut) *Courant*. At one time he was associated with E. C. Stedman in the publication of the *Herald* at Winsted, Connecticut, and all his life, from the time he began learning the printing business at Amherst, Massachusetts, has been spent in a newspaper atmosphere.

—Hon. John Bigelow, ex-Minister to France, started not long ago for an extensive trip in Europe, but has been recalled from Copenhagen by the death of a son-in-law.

—Emin Pasha has been made a Doctor of Philosophy by the University of Koenigsberg.

—Seven of the twenty-seven widows made by the massacre of the Little Big Horn were officers' wives, and four of these were strongly bound together by the ties of relationship and friendship. Their husbands were General Custer, Captain Yates, and Lieutenants Calhoun and Smith. The quartette of women were all thrown on their own resources, and have bravely met the demands made of them. Mrs. Custer has won an enviable literary reputation. Mrs. Calhoun, a sister of General Custer, studied elocution, and is a successful recitationist. Mrs. Yates had three children to support and educate, and is doing it by giving dancing lessons; while Mrs. Smith is a skilled worker in embroidery.

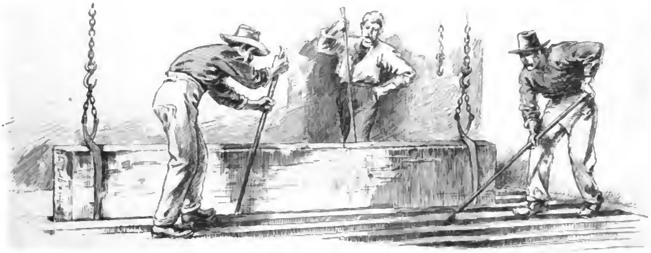
—The military service of the late Lord Napier of Magdala covered a period of sixty-three years, nearly all of it being spent in active campaigning in India and other countries where British conquest was sought. The storming of the fortress of Magdala, in Abyssinia, gave him his title and a pension of $10,000 a year, and in 1876 he was made Governor of Gibraltar, with a salary of $25,000. He resigned this post in 1882, and since then has held the commission of Field Marshal.

—A full-blooded Moor, Madame Margaret Vayo, died in Boston recently at the age of one hundred years. She was brought to this country by Jesse Hallister, of Burlington, Vermont, a captain in the Revolutionary war, and thoroughly educated. Having married Louis Vayo, a Frenchman, she had eleven children, several of whom became quite celebrated as musicians.

—Among the Mongolian residents of Mott Street is Whong Fok, an aged and distinguished-looking Celestial, who keeps himself aloof from his countrymen, but seems to delight in deeds of charity. He is said to have distinguished himself in the famous Tai Ping rebellion of years ago, and to have fled the country to save his head. His life as a hermit is a self-imposed penance for wrongs committed as a rebel.

—The Emperor, Princes, Generals, Cabinet Ministers, and Ambassadors attended the funeral of the late Cardinal Prince Archbishop of Vienna, the son of Farmer Gangelbauer, of Upper Austria, and humble peasants stood side by side with court dignitaries during the splendid ceremonial. Celestin Gangelbauer became a monk while a young man, and rose step by step till he was the Primate of the Austrian Empire, with an annual stipend of $30,000. He gave largely to the poor, and left but a small fortune. His successor will probably be Cardinal Count Schoenborn, Archbishop of Prague, formerly an officer of cavalry, and who greatly distinguished himself at the battle of Sadowa.

—Henry W. Grady was a most enterprising newspaper man. He reached Charleston at ten o'clock on the night after the earthquake, and by 2 a.m. had put eight columns on the wires, his report of the occurrence in the Atlanta *Constitution* being generally accepted as the best sent out. At another time he employed four hundred men and as many horses in gathering the returns of two important Congressional elections in the mountain districts of Georgia, and had the full result within ten hours after the polls had closed, although it cost him $2200 to do it.



EXAMINING SLAB OF ICE IN PROCESS OF FREEZING.

madness almost at the moment that he was saved.

For myself, I had nothing to add to these horrors; yet such was my frame of mind that I found a certain bitter gladness in listening to the telling of them, and in tracing between them and our own case the ghastly parallel. In our talk, which went on in English, Fray Antonio took no part; but he could follow well enough the meaning of it in our tones. On his face was an expression of tender melancholy that seemed to me to tell of sorrow for us rather than of dread of what might be in store for himself; and that this truly was his mood was shown when the others paused, sated and appalled by the horrors which they had conjured up, and he spoke at last.

It was not a sermon that Fray Antonio gave us; but out of the abundant store of faith by which he himself was sustained he strove to comfort us with thoughts of better things than life can give. And with the promise of hope, that he held out to us with the solemn authority that was vested in him by reason of the service to which he was vowed, he mingled a certain yearning for us, very moving, that came of the love and the tender gentleness that was in his own heart. And yet, though he knew that, excepting Pablo, we all were heretics according to his own creed, there was no word of doctrine in all of his discourse. Rather was what he said a simple setting forth of that primitive Christianity which has its beginning and its ending in a simple faith in an all-pervading, all-protecting love. And of this love, as it seemed to me, he himself was the human embodiment. Looking in his gentle face, which yet had such high courage, such noble resolution in it, I felt that in him the spirit of the saints and martyrs of long past ages lived again.

With our souls soothed and strengthened by what Fray Antonio had spoken to us, we lay down at last to sleep; yet was it impossible for us to drive out from our hearts that natural sadness which men must feel who know that they have failed in a strong effort to accomplish a project very dear to them, and who know also that they are standing upon the very threshold of a most tormenting death.

[TO BE CONTINUED.]

THE CLUBS OF BOSTON.

(Continued from page 80, Supplement.)

From Boylston Street the club, growing prosperous as Boston recognized that it was really wanted, moved into its present house on the Back Bay, once the dwelling-house of one of the city's leading bankers. And now within its walls one may hear good talk, and be reasonably sure of those delights for which Sam Johnson founded his tavern-haunting assemblies of good fellows. And one may meet straying actors, playwrights, authors well favored by fortune, and authors whose unsuccessful volume does not count so long as they have ready tongues and merry wits. And there are Saturday evening meetings, called smoke talks, held in the big gallery in which the artists show their handiwork (for the borderland is preserved), and at these smoke talks papers are read, and are disputed about by men who sit at round tables, where they partake of tobacco and beer along with their intellectual provender. And, finally, there are concerts given on Sunday afternoons by an orchestra of members, and to these come the very elect, both men and women, for even so has Boston become wider and more nearly in touch with modern civilization; but it is not the St. Botolph, most genial and sparkling club as it is, that has brought about this state of things, but the club is the blossom of the life about it, and having once bloomed, its fragrance has permeated the whole community.

It will be observed, I hope, that no wonder is expressed at this employment of Sunday, and no mention has been made of the Puritan Sabbath. It is quite as absurd to be playful on the difference between modern life and Puritan theories as to express curious astonishment at the abstention of modern civilized man from the practices of cannibalism. There is no humor in a fact so long established as to be commonplace. The Puritans lived in the early youth of the race, and would be astonished by nearly everything that occurs in the daily lives of their very much more highly developed descendants. They would not only be horrified by the Sunday concerts at the St. Botolph, but conscientiously neglectful of their divinely formed bodies as they were, they would have shaken their lank clumps at the swimming pool, the baths, the gymnasium, and the tennis-courts on the roof of the great Athletic Club, which is a noble monument to Bostonian worship at the shrine of muscle.

In the modern love of sports, Boston holds first place. The Country Club at Brookline, successor to the Myopia Club, established by a family of short-sighted youth, is the oldest of our country clubs, and the still existent Myopia Hunt dates far back. There are more athletics to the individual than in any other city of the Union. Rowing races were an institution of the municipal Fourth of July celebration when they were in their merest infancy on the Harlem River. There are yachtsmen in New York as well as in Boston, and hard riders over hurdles and after the hounds, tennis-players, and what not. Whether the metropolis contains the famous boxers that were to be found at the Crib Club is a question that would be doubted by the gilded youth who remember witnessing the early efforts of the renowned Sullivan and other great men in the mills that were held under the auspices of the club. Out of this old boxing organization, at which a vast amount of local talent was developed, grew the Athletic Club, which is one of the largest organizations of its kind in the country. It is one of those vast concerns with which we are becoming more familiar, provided with the means for strengthening the bodies of the human race. The men who build such a club-house as that of the Athletic Club, of Boston, at least appreciate the body at its true worth. Here exercise is surrounded by all that luxury can bestow, and pampered appetite can find its corrective under the roof where it is gratified. Athletic clubs are possible because their membership is enormous. Thus far the Boston club has not undertaken to maintain a race of runners, hammer throwers, putters of the shot, and other experts, for the purpose of winning prizes. It may be, in the time to come, that the Bostonians will grow up to the adoption of this trick, but thus far they have been in the habit of doing their own feats of strength and agility, as they have usually sailed their own yachts, even in those momentous preliminary trials in which the cup defenders were chosen.

The Country Club, originally instituted as a hunt club, is what all country clubs have become. Its pleasant house in Brookline, the most beautiful suburb of Boston, is a place to which one drives or rides, where excellent dinners are served, and whither people go for dances. Either there is something more frolicsome in a ball at a country club, or else there is a deal of enjoyment on the way there and back. And the Country Club of Boston is admirably situated for getting the full enjoyment out of this process of going and returning, for it is not, like the Country Club of Westchester, far from the homes of citizens, nor is the approach over the rough roads of towns that will not mend their ways. Brookline is not far away, and the roads are so hard and smooth that they would gratify the soul of the Scotchman who invented them.

Unique among clubs is the Tavern, which had its origin in a restaurant where an Italian cooked his native dish after a fashion so common in New York that dozens of places can be found here where the macaroni is quite as good as that which actually astonished the provincial palate of Boston—for it must have been realized before now by any one who has had the patience to read so far that Boston cannot be so intensely local and individual without being also intensely provincial. In New York the Italian would have continued to keep his little restaurant, serving his macaroni to appreciative customers, no strangers to his dainty art; but in Boston his art was new, and there being added to the local lovers of the pasty stems some foreign musicians, the restaurant became a quaint club, full of the fun and spirit of which musicians and artists were the centre. William D. Howells was its first president, and it has now a building of its own. It is another outgrowth of the development which has made the St. Botolph possible and prosperous.

To mention all the clubs of Boston would be to introduce into the article what, according to Freshman criticism, is a defect which not only mars the Second Book of the Iliad, but is so obtrusive and expansive as to come in time to be the only feature of the epic that is recalled by Bachelors of Arts. Moreover, to name the Suffolk, the Central, and the many-motived dining clubs would be merely to demonstrate that Boston human nature is like its kind the world over, and loves segregation. We must be content with showing the kind of club life that Boston possesses, avoiding the error into which Homer fell, and the vain and foolish labor of demonstrating an axiom. All cities, and all men of happy social disposition, have their clubs, which are precisely what they are made by those who frequent them.

IDEALITY.

THEY brought high honor, loyalty to truth,
  A swift keen justice, and an iron will,
Yet stern—those grand old Puritans, in sooth—
  As that wild shore when winter winds were shrill.
  A light, a fire, a something mocked them still—
A light that waked in sweet Priscilla's eyes;
A fire that flashed, defiant of disguise,
  Through many a heart devoid of outward ruth;
A something born of Heaven that never dies.

In that grim soil, beneath its rock and snow,
  A spirit slumbered, biding till its hour.
The spirit wakes, the seasons come and go,
  And the wide land is glad with fruit and flower.
  The years roll on, and lo! that subtle power
Those stern hearts vainly strove to crush in shame
Has fired men's souls to higher, holier aim
From Maine's dark pines to Rio Grande's flow,
  From sea to sea—a deathless, heaven-born flame.

CHARLOTTE W. THURSTON.

ICE-MAKING IN NEW ORLEANS.

ICE is not now so much a luxury as a necessity of civilization. In northern latitudes it is one of the few simple products of nature which enter unchanged into consumption, and cannot be improved or imitated. Southern latitudes could only get it, however, by bringing it from the perpetual reservoirs of mountain snow fields and glaciers, or from deep caves, as is done in some foreign countries, or else by importation from the stores collected upon Northern lakes and rivers.

With the knowledge of chemistry, however, came a discovery of a means for producing cold artificially under limited conditions; and with the advance of mechanical ingenuity there arose inventions for the application of this chemical knowledge upon a large scale. Hence ice can now be manufactured in the warmest climates in any amount required, and this can be done so cheaply that in this country the old business of carrying it from the Northern to Southern States has well-nigh disappeared. Every Southern town now has its ice factory, and in the larger cities several may be found, and their product is superior to any but the clearest natural ice, frozen under the sudden and severe cold of the St. Lawrence Valley, while its substance is as pure as the distilled water of which it is made.

The machinery and apparatus required for making ice commercially form an extensive plant. There must be a powerful engine to drive the pumps; great iron retorts to hold the aqua ammonia and generate the gas, and to receive it again; a long system of pipe coils for the circulation of the gas; and extensive vats, in which the ice-cans are placed and the ice formed.

The process is simple in its philosophy, and depends upon the heat-absorbing power of a substance which is expanding after great condensation. The substance used in this case is ammonia. Mixed with water to the amount of 26 per cent., it is placed in one or more great cylinders or retorts, which contain coils of pipe. Into these pipes steam is sent, heating the contents of the retort until the ammonia is separated from the water and forced out into another retort, where it is subjected to a pressure of something over 200 pounds to the square inch, under which it liquefies.

In another room, which has double walls and ceiling and protected doors, as in a refrigerator, are arranged one or maybe several vats, each perhaps 50 feet square and 10 feet high, in which are suspended from the top frame or covering as many cans, made of galvanized iron, as the space will accommodate. A convenient size is a can about 4 feet high, 8 inches wide one way and 16 inches the other, which will hold a cake weighing just 200 pounds. Some, however, are much larger than this, as is the case in some of the New Orleans factories, where the cakes are slabs extending clear across the vat, which need to be sawed up before marketing. Between all these cans, as they hang in the vat, pass lines of iron pipe, connected with mains outside that lead from the retorts, and the whole vat is filled with brine; so that when the cans are all in place the space between them is filled with salt-water, in which they are immersed up to their rims. This brine is kept in motion by pumps, so as to maintain a uniform temperature throughout.

Such is the whole apparatus for manufacture. In the great condensation to which the ammonia gas has been subjected in order to liquefy it, it has been obliged to part with its heat, and the large pipes in which it is carried to the vats are white with frost, showing how cold they are.

When ice is to be made, the cans are filled with distilled water—the machinery for producing which is a part of the plant—and covered with thick caps. Then the stopcocks are turned, and the ammonia admitted from the main pipe into the coils that run throughout the brine in the vat.

The instant the tremendous pressure is relieved by opening the stopcocks, the liquid ammonia expands into gas, and rushes to fill every coil of the pipes. In this expansion it must reassume the amount of heat it parted with when undergoing condensation, and it extracts it from the surrounding brine, which presently becomes so cold that it in turn extracts all the heat there is in the distilled water within the cans, which at once begins to congeal, as would the water outside the cans were it not saline and in motion.

In a few hours each can is found to contain a block of solid ice. A travelling pulley is then rolled over it, hooks are fastened to the can; it is hoisted out of the vat, lowered for a moment into a bath of warm water to loosen the ice, and then upset, whereupon the block slides out, and is taken away to be stored, or put into a delivery wagon, or placed in front of a circular saw and divided into smaller blocks.

A perfect block of such ice is as white, transparent, and flawless as a cube of flint-glass—a perfection due to the absence of any air whatever in the distilled water from which it is made. Spring, or hydrant water, however pure, will not answer here, as it contains so much air that the ice would look like snow, and have little solidity or value. With the greatest precaution, however, some air will get mixed into almost every canful, and will appear in the ice as a core or tree-shaped centre of quill-like bubbles, which is sometimes exceedingly beautiful. The freezing always begins at the bottom and sides, driving the air to the centre and proceeding toward the top, so that the cans do not burst. Of course a fish, meat, fruit, or anything else suspended in the water of the can will be enclosed in the ice with handsome effect. This ice is sold at wholesale for from 40 to 50 cents a hundredweight; at retail for 65 to 75 cents.

After the ammonia gas has done its work, it is returned to a retort, and thence conducted again to its starting-place, where it is reabsorbed by the water, and can be used over again. Thus the process goes on continuously as long as needed. There is some waste, of course, which is supplied by pure or anhydrous ammonia. One of the curiosities of the factory is to set a cup of this on the stove. It will boil almost immediately, but the unlearned visitor is astounded to see mercury drop far below freezing-point when it is plunged into the vaporous ebullition.

Attached to many ice factories are cold storage-rooms, in which a low temperature is maintained by pumping into them or their surrounding chambers the cold air produced in the ice-making. The pump which does this work will be fire-hot at one end, where it gets its steam-power, and thickly glazed with ice at the other end, where the cold air is fed to it.

STORM AND CALM.

BY R. K. MUNKITTRICK.

I.—STORM.

OVER the leaden sea the wind blows shrill,
  Hurling the billows on the sullen shore;
  It thunders with the battle's brazen roar,
Piling the waves in many an angry hill;
The tempest bellows with a maddened will.
  What surging harmonies its trumpets pour,
  In choruses that to the heavens soar,
And all the sky with rumbling tumult fill!
While variations of its wind-swept wail
  Are intermingled with the sudden booms
    Of seething breakers on the shore of night.
Out of the inky darkness and the gale
  Calmly, defiantly the light-house looms,
    All-glorious in its wreath of living light.

II.—CALM.

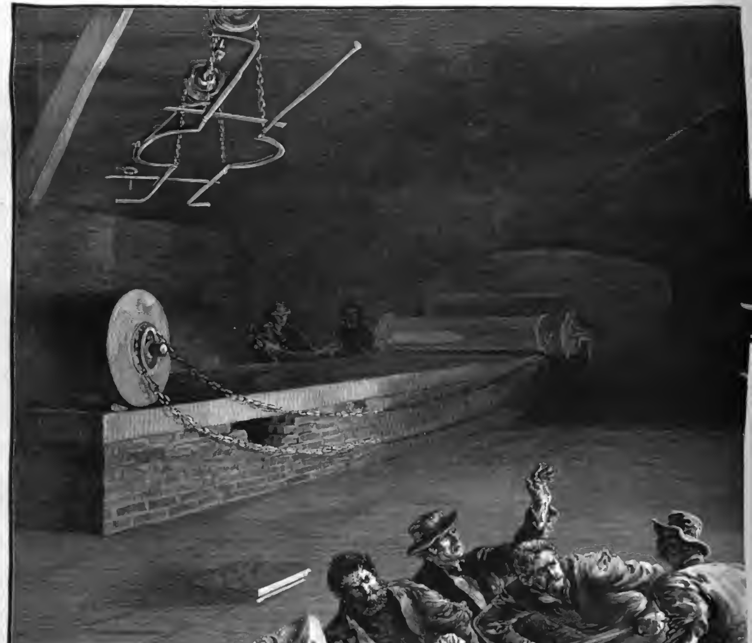
Now morning on the pulseless ocean throws
  Its white-winged kiss, and in the smile of day
  Dissolves the sea's pale drapery of spray,
While the new moon beneath its bosom goes;
It shimmers faintly in the kindling rose
  Of dawn that flecks the weary wastes of gray.
  A soothing quiet stretches far away
That seems the incarnation of repose;
The music of the sea—that's never still—
  Breathes its celestial spirit on the calm,
    Like a soft prelude from the tide of sleep,
While the first sunbeams tremulously fill
  Yon idle sail that, spread for isles of palm,
    Rests like a day-dream on the shining deep.

THE FATE OF BOOKS.

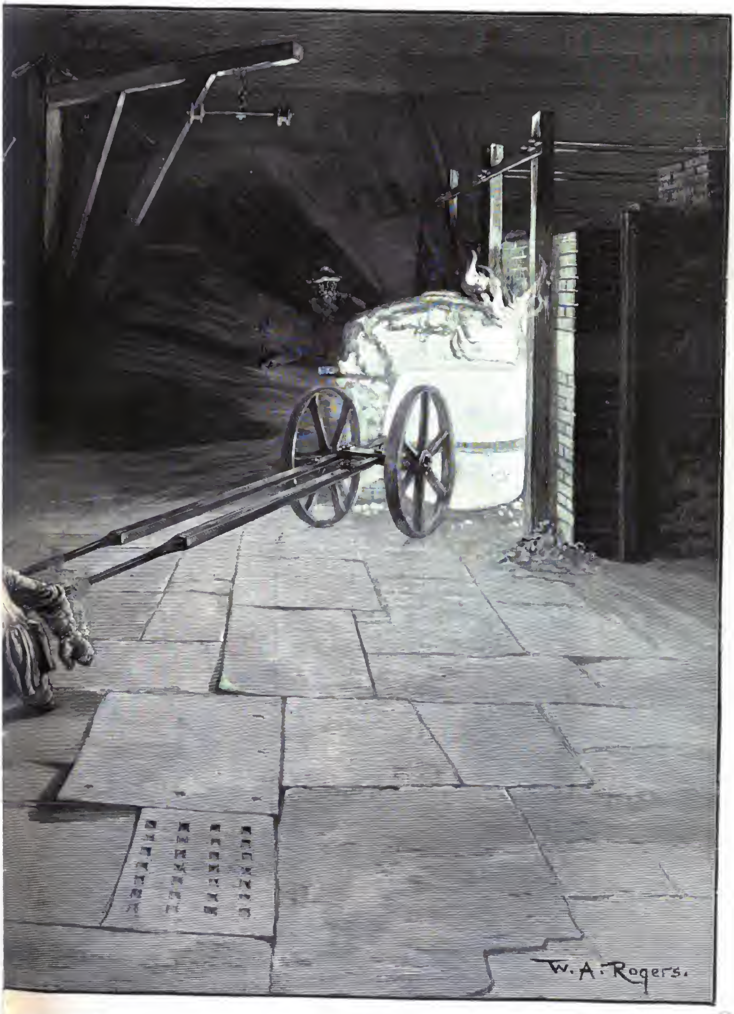
THE ups and downs of many an important literary work of antiquity have been most singular. In a very unique way they demonstrate the correctness of the classical dictum "habent sua fata libelli." It is well known that the accidental discovery in a waste-basket in the Mount Sinai Cloister of several leaves of the *Codex Sinaiticus* led to the finding by Tischendorf of that most famous manuscript of the New Testament. A recent publication by the French savant Omont has drawn attention to the strange fate of another old manuscript, and at the same time indicates the laborious methods to which scholars must resort in order to rediscover some of the lost remains of ancient literatures. In one of the well-known cloisters on Mount Athos, where more than twenty thousand Greek manuscripts are preserved and awaiting further research, there existed at one time a sixth-century copy of the Pauline epistles. In the thirteenth century monkish ignorance destroyed this valuable document, and used the leaves as binding for later and inferior books. A number of these manuscripts in the seventeenth century found their way to western Europe, and came into possession of the French Chancellor, Pierre Seguier, and are now found in the *Bibliothèque Nationale* in Paris. In the year 1715 Montfaucon found in these bindings fourteen leaves of this old epistle manuscript. Some years later other leaves were found, namely, two in the Synodical Library at Moscow; four in the possession of Bishop Porfiri and of the Abbot Antonius, of Kiew; two in the University Library at Turin; nine in the library of the Lawra Cloister on Mount Athos. In this way thirty-one leaves of this manuscript had been rediscovered, but scattered over all Europe. To these Omont has added ten more, one of which was found in the Rumjanzen Museum at Moscow, and nine in the collection which the French specialist in Greek literature, Emmanuel Miller, had found in an Athos cloister, and had been secured by the National Library in Paris. Of these nine leaves, however, two had in the beginning of this century in some way or other found their way to St. Petersburg, where also one of the leaves of the nine originally belonging to Bishop Porfiri was rediscovered; and of the nine leaves which Duchesne in 1875 found in the cloister Lawra, one is now in Paris.

Accordingly, the forty-one leaves of this sixth-century manuscript are found scattered in no fewer than eight libraries, namely, twenty-two in the National Library of Paris, eight in the Lawra Cloister on Mount Athos, two in the Synodical Library at Moscow, one in the Rumjanzen Museum at Moscow, three in the Imperial Library at St. Petersburg, three in the Academy of Kiew, and two in the University at Turin. And yet these leaves contain only about the one-tenth of all the epistles, namely, 234 verses, divided as follows: 16 from I. Corinthians, 42 from II. Corinthians, 26 from Galatians, 29 from Colossians, 18 from I. Thessalonians, 44 from Hebrews, 40 from I. Timothy, 9 from II. Timothy, and 18 from Titus.

By a similar process Professor de Goeje, of Leyden, has succeeded in rediscovering the works of Tabari, who for Arabic historiography is what Thucydides is for the Greek and Livy for the Latin. His history was supposed to have been lost, with the exception of a few fragments. De Goeje, through correspondence with nearly all the libraries of Europe, and many in the Moslem lands, has been able to gather together again all the parts and portions of this standard work, to which the library of the leading mosque in Tunis furnished the chief contribution. Literary coadjutors are at work in dozens of libraries copying and collating the fragments, and it is supposed that five years will elapse before the whole of this valuable work will be given to the historian and Orientalist.



DRAWING A POT OF MOLTEN GLASS FROM THE FURNACE.—Drawn



W. A. Rogers.—[See Article on "The Art of Cutting Glass"—[See Page 70.]

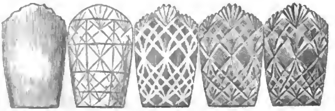


Fig. 1.

THE ART OF CUTTING GLASS.

The art of glass-making is very ancient, while it and the arts by which it is embellished flourish in an exceeding great measure, and have attained a degree of excellence which makes them very interesting. Their products are among the beautiful achievements of men, and human genius, working in this lustrous and ductile material, has given to us much exquisite pleasure. In our own country these arts have advanced in recent years with most wondrous strides. The decorative glass used in domestic architecture and in memorial and church windows has a beauty of tone and depth of color that are seldom surpassed, while in the lesser art of cutting, no country in the world excels us. It is this art and its recent development in the United States that will make the subject of this paper.

The large picture by Mr. Rogers on another page illustrates the work of the "crew" with a "melting-pot." This is the basic implement in the manufacture of flint-glass—the kind that is used for vessels that are to be decorated by cutting, engraving, or etching. The pots, called "monkey-pots," differing from those used for making glass of other qualities, are an oval cylinder, with the opening at one side of the top. They are immense vessels, capable of holding about 1500 pounds of melted glass. They are from 3 to 3½ feet high, and from 4 to 5 feet wide. They are very carefully built up with a clay that is toughened by treading. Most of the pot clay used in this country is imported from England or Germany, although good clay is found in the United States, and is gradually coming into more and more general use. It is possible that the time is approaching when American clays will be almost wholly used, and that all that is required to bring about a universal confidence in them is a larger and more intimate knowledge of their component parts. The pots must be treated with the utmost care, for the slightest flaw will be fatal to their valuable contents, and will result in serious loss. The clay must be selected with the utmost caution. It must be almost entirely free from lime and iron. In its preparation it is first mixed with warm water until it becomes a paste, and is then kneaded by men with naked feet. It is put aside in a damp room to ripen; when it is to be used, it is mixed with the ground material of old pots. The pots are built up by hand, layer after layer. The pots cannot be made continuously, but must be left occasionally to dry, in order that the lower layers may not be pressed out of shape by the successive masses of clay. When the pot is finished it is removed to a drying-room, where it is protected from draughts, so that the drying may be uniform. This process is completed in a second room, which is heated by a stove, and afterward the pots are placed in a store-room, where they are kept from six months to a year, and they are finally made ready for the performance of their task by being placed in the annealing furnace for four or five days. They are here subjected to a great heat, and are kept red-hot. In this state they are moved by an immense forceps on a truck drawn by a crew of men to the main furnace. This work requires great skill and quickness. The pots are enormously heavy; intensely hot; the glare is almost blinding; and they must be moved so quickly that the pot shall not be injured by sudden cooling. Several of these pots are placed on a platform of stone or fire-brick in the furnace, each opposite a small opening through which it can be filled. The entrance to the main furnace, through which the pots were introduced, is now closed with a movable door of brick. This is done in order that the heat may be retained. The pots, being closed in, are filled with the material from which the glass is made, called frit. The melting or vitrifying of this mass is called founding. This melted mass, from which the scum must be removed when it is hardly distinguishable from the white light of the fire, is called metal, and is ready to be worked up. In the course of this process the pots are subjected to a great strain. The heat may develop a latent imperfection which will crack or burst one of them. In that condition the broken pot and the leaking metal are very dangerous to the neighboring pots and their contents, and must be removed as speedily as possible. The furnace must be broken open. The "crew" accomplish this protected by sheet-iron plates, seize the pot in the forceps, and run it on the truck quickly to the open air. This task is not unattended with danger, and demands great dexterity.

The mixture which is used for the manufacture of flint-glass is sand and oxides of lead and potash. Its color and lustre are given by the lead, which may be said to characterize it. The pots are closed at the top, because the metal must be protected from impurities. The contents of the pot may turn out to be good or bad. The result, especially when the glass-makers are not thoroughly expert, is a lottery, and it is probable that American flint-glass has not so high a standing as the English or Baccarat largely because the makers have not been so skilful as the foreigners. Nevertheless, the product of the American flint-glass works is improving every year, and glass has been made in this country which is not excelled anywhere; while as for the glass used for cheap table-ware, it is made better in the United States than anywhere. It is here that lime has been substituted for lead in the glass made for this purpose—a notable discovery, for lime glass has much of the lustre of lead, and is very much cheaper.

The glass which is to be embellished by cutting is formed into its final form either by blowing or moulding. Flint-glass is also pressed, and in some cases a glass vessel has been subjected to all three processes. As a generalization merely, it may be stated that the round vessels, like tumblers and goblets, are blown, and that square vessels are moulded. The blowing of flint-glass is a process similar to that employed in the window and other glass factories. The man with the gathering iron thrusts his blow-pipe into the furnace and gathers his ball of glass on the rod, and this bulb of glass is blown and manipulated, shaped with irons, and moulded into the shape which is required. Almost every one has seen the glass-blower at work, and knows how the soft and ductile glass is pulled out in all directions; how holes are blown into cylinders that are intended for hollow goblets; how, when the glass cools so that it can no longer be manipulated, is sent once more to be heated in the furnace. If the vessel is of a shape that is produced by moulding, the gatherer drops the molten mass into an iron mould, which is immediately closed and pressed together. It is better for the lustre of the article, however, that it should be blown, for it acquires a certain polish by manipulation in the air, of which the mould deprives it.

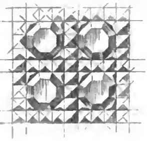

Fig. 2.

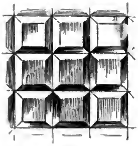

Fig. 3.

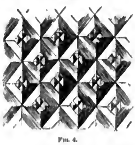

Fig. 4.

In the expensive glass which is used for cutting, and which must be even in color and very much thicker than that which is pressed, the stems of the goblets and wineglasses are drawn out from the bowl while the glass is warm, and the round disk for the bottom is subsequently attached. Odd-shaped vessels, such as are now the fashion for berries and flowers, are made by manipulating the soft glass with irons. The handles are separate pieces, drawn out while the metal is in its ductile state, and fastened to the vessel while each bit of glass is still hot. Every precaution must be taken that the two pieces of glass shall be of the same temperature, for if they are not, cracking is easy, and the jug and the handle soon part company.

The formed vessel which is intended to be the subject of the cutter's art is called a blank. It is a rough, unfinished bowl or goblet, but it has an even color, and it rings like a bell. It carries the mark of the end of the blow-pipe from which it was recently detached. Its edges are rough, and its surface is not smooth, in consequence of its contact with the chilled surface of the mould. It is now ready to be made beautiful. It is first marked with the general lines of the pattern which is to be cut, and then it is cut and polished. Fig. 1 shows the different processes through which a piece of cut glass passes. The first panel shows the blank as it comes from the blow-pipe; the second shows the pattern as it is marked out in red lines; the third shows the rougher's work; the fourth, the smoother's; and the fifth, the polisher's.

The patterns which are cut in the glass are various modifications of conventional designs, the manufacturers vying with one another to compose new combinations which shall make their articles brilliant and attractive. It must be borne in mind that the common notion that thin glass may be cut is erroneous. In addition to pressed and cut glass, there are engraved and etched glass. The difference between these two is easily discernible. The engraved glass is ornamented with sharp metal tools and diamond dust, and the design is made by grinding the lines, which are white and opaque—what is commonly called ground glass. Etching is done with hydrofluoric acid. The glass is covered with an impression coating of wax or similar material, leaving only the pattern exposed, which is eaten out by the acid. Only heavy thick glass, in which it is possible to make deep as well as sharp impressions, is cut.

The patterns that were known in earlier times, and are fundamental, were the hobnail (Fig. 2); the block (Fig. 3); the strawberry (Fig. 4.) The last has a small cone on the face of the diamond. The faces of the others are plain. The workman who lays out the blank for cutting draws his red lines to indicate the general character of the pattern. If the faces are to be ornamented by the star of the strawberry pattern, or by more elaborate devices, by lace-work, for example, or if there is to be a fan edge (Fig. 5), now very fashionable, the cutter is left to work it out without preliminary lines. In addition to the lines that indicate the general character of the pattern, are others which mark the limit beyond which the cutting must not be carried.

The first operative to take the glass after it has been laid out is the rougher. He sits behind a steel wheel which has a sharp mitred edge. The steel of which this wheel is made is soft, so that the workman sharpens it by scraping it, as it revolves, to an edge with a tool of harder metal. The rougher cuts the deep general lines of the pattern, which have been marked in red. The size and edge of his wheel vary with the character of the work which is demanded. The lines of small articles, like wineglasses, are comparatively light, while those on a large salad bowl are proportionately thick. These lines, as the vessel comes from the rougher, show the grinding. We have once more the effect of ground glass. Some of the cutter's work is much more difficult than others. It is what is known as blind work. The red lines are on the side of the object opposite to him, so that he must look through the glass. Sometimes, as in the cutting of a glass stopper, he cannot see the lines at all, for the material on which he works is so thick as to be opaque. He sometimes is compelled to cut a small object on the underside of the wheel, almost entirely out of his sight. He must depend a good deal for his success in such cases upon his nerves and his sense of feeling. The accuracy with which the swiftly revolving wheel passes into the proper channels depends almost wholly upon the keenness of his touch.

Above the wheel of every cutter is a large funnel, from which wet sand is dripping constantly upon the wheel, and from it into a trough. Fig 6 shows a cutter at work, with all his tools and implements.

When the rougher has finished his task, the glass goes to the smoother, who works with a stone wheel. This wheel may be mitred, or it may have a broad edge. It ought to be stated that before the cutting can be done the vessel is ground on the bottom so that it stands evenly, and the edges are ground smooth. This grinding is done on the side of a wheel, which may be mounted either vertically, like the wheel used for cutting, or horizontally.

Skilful work is done with the mitred stone wheels. It is with these that the exquisitely fine work which characterizes recent cut glass is done. The smoother runs his stone wheel through all the lines which the rougher has cut with his metal wheel, and the result is to smooth them and restore their translucency. Then he cuts upon the plain faces that have been left, the net-work of decoration, in stars, crosses, fans, small diamonds, or whatever fancy has suggested to break up the plain surfaces, and almost indefinitely increase the number of light-reflecting facets. The smoother also makes the scalloped and fan edges. Every manufacturer has his own combination of the simple elements, and names his own patterns. The names are, therefore, legion and arbitrary. There are Russian, Electric, Alhambra, Brilliant, and hundreds of others.

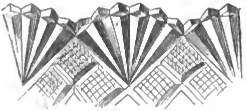

Fig. 5.

When the smoother has completed his task the cutting is finished, and the work of the polisher begins. Very often the smoother does his own polishing, but not always, for the material employed is not wholesome, and the occupation is considered as especially conducive to lung diseases.

The stones used for the smoothing wheels are imported, and are of different degrees of density, and therefore of hardness. They come from England and Scotland. They are the Craigleith, from Scotland; the blue mitre and the brown (both hard and soft), from England.

The polisher runs through the cuts made by the stone wheel of the smoother. His own wheel is of wood or cork. The polishing wheel is kept wet with moistened pumice and rotten-stone. From the wood or the cork wheel the glass goes to a revolving brush, and it is this part of the work which is unwholesome. The brushes are made of a variety of material, and are in the form of a wheel. They are not made solid by a disk of wood or other hard material, but wholly by the rapidity of their revolutions. These brushes are fed with putty powder, which is calcined lead or tin, and is blown upon the wheel when in a dry state. The brush and the putty powder remove all particles of dirt and the smear of the pumice and rotten-stone, and give to the glass the brilliancy and lustre which make much of its beauty. After the polishing the glass is very carefully and thoroughly washed—washed as it seldom is again—with soap, water, and brushes. Then it is wrapped in tissue-paper, and is ready for the store.

It will be seen that every process in the making of cut glass is expensive. The material must be free from impurities; generally it is imported. The pot in which it is melted is a work of exceeding difficulty, requiring much skill, patience, and time. It is very fragile, and the breaking of one may injure a whole furnaceful of pots and their contents. Finally, glass is fragile, and the percentage of breakage in the cutting factory and the store is comparatively large. The blanks for cutting are of a metal much superior to that which is finished in moulds or presses.

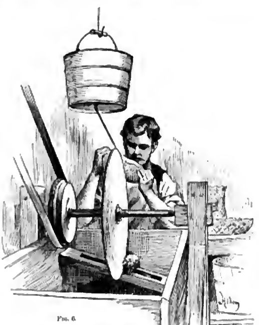

Fig. 6.

Sometimes color is seen in the finest cut glass.

The color of a claret pitcher is often ruby, and sometimes there are two colors, especially in wine-glasses, red and yellow predominating. These colors are oxides of the metals, usually of gold, and are not mixed with the metal in the furnace, but are washed on the blank. If there are two colors, therefore, a slight cutting gives the design in one color, while the plain surfaces remain of the other. Usually the pattern is the color of the glass, the rest of the vessel being ruby or whatever color has been washed on.

The art of glass-cutting has greatly developed in this country within ten years. It has followed the increased demand of the consumers, expensive cut glass being now greatly in vogue. At first most of the glass was imported, but there are now many large establishments, especially in the East, and many of the most important firms have cutting shops of their own. The best workmen are induced to come here from abroad, especially from England, by the high wages paid. Some of the cutters receive eighteen dollars for a week of fifty-seven hours. Now, however, a large number of native Americans are learning the trade, and it is the opinion of experts that glass is cut in this country as skilfully and as artistically as it is anywhere in the world. There is nothing in the way of manufacturing cut glass which shall be equal to anything of its kind and entirely American. The clay for the pots is here, the material for the metal, the steel wheels are made here, the best material for the polisher's brushes comes from Mexico. The only things lacking are stones for the smoother's wheels.

AN OPPORTUNITY.

We sat at the club in the fire-light,
As it flickered and played on the wall,
And we chatted of music and Egypt,
Of the opera, art, and the ball.

And I talked half the night with the others,
But my thoughts had flown far o'er the main,
And were dwelling in quiet seclusion
In the halls of my castle—in Spain.

In the castle I builded so lofty,
Which got a hard knock yesterday,
When they told me Tom Jones is to marry
Nell Murray—sweet Nellie—in May.

Why, Nell Murray has dwelt in that castle
Ever since it's been mine, and it's plain
That without her light footsteps and laughter
'Twill stand silent and lonely in Spain!

She used to walk, too, with some children
In the gardens so sunny and wide;
But to-night they have all of them vanished,
And it seems as though some one had died.

Well, Jones is a good-looking fellow;
I think, since my fancies are vain
And he has run off with its mistress,
I'll shut up my castle in Spain,

And I'll hang out a neat advertisement,
Which somewhat as follows shall read:
"For sale or to rent, ready furnished
To meet every possible need,

A mansion of fine, airy structure,
With a wide and extensive domain"
And I'll sell to the first man who offers
To purchase my castle in Spain.

EMILY ALVORD.

FÉLICIE.

A CANADIAN SKETCH

BY R. N. TREVOR.

No one remembered such a drought.

"If old Gaspard had not died," said Edmond confidently to himself, "he could have matched it; but then he's dead, so no one remembers so bad a drought as this one."

But no one heard Edmond: if any one had heard him, he would have paid no attention, for Edmond did not have all his wits.

The grass and the crops, which once had been green, were now brown; the earth was baked hard, and everywhere little cracks ran in all directions. The rough places of the roads were all hidden under a thick mantle of dust, as kindly in its appearance as the winter's mantle, but less so in reality. Unless the rain come—well—

"God knows what we shall do," said one village elder to another.

"And He never tells us until He is ready," said Edmond, reverently.

So the great drought lasted.

Then Armand Hamel died. It was not the drought that killed him. No one knew exactly what had killed him. "I cannot tell, it is God's doing," the doctor had said. But he was dead, and after death comes the funeral.

For the first time in months the sky was overcast; the red sun ceased to glare upon the earth, and under the gentle clouds the grass and the crops seemed actually to revive a little, and even to raise their heads again. But no rain fell.

"Does this mean rain?" one villager would ask of another as they met in the parish house, while their wives went at once into the church to pray.

Perhaps the man addressed would answer, with a shrug, "The clouds hang low over the cape"; or perhaps he would go out upon the gallery, whence he had just come, and looking around at earth and sky and sea would say, cautiously: "Who knows? Perhaps."

In either case the answer was satisfactory. Every one hoped for rain, almost no one expected it; and the question was asked rather to pass the time until the funeral service should begin than because Eugène Dasylva thought that Joseph Bilet could read the weather signs better than he himself.

No one asked Edmond: but he of all those present said nothing doubtful. To Eugène he said at once, "It will rain; the grass is getting ready for a shower." But no one heard him; at all events, no one paid him any attention; he was only half-witted.

From the gallery in front of the parish house one could see many things. Directly in front was the road white with dust, filled with the calèches and planches and quat'-roues which had brought the farmers and villagers to the church. Across the road were fields, and beyond the fields hills, cut into terraces by great glaciers melted ten thousand years ago. On the right was the church, with its tin roof and its spires; and the priest's house, with two willow-trees in front of it, and the convent and the graveyard. On the left, behind the poor brown trees, was the seigneury; and behind the house, across the river—a mile wide when the tide was in, barely two yards wide when the tide was out—rose the cape which gave the town its name, and seemed to protect the town it named.

Over the cape hung black threatening clouds, but so little did they indicate rain that the farmers' eyes more readily sought the church and the priest's house than they did the great rock and its low-hanging crown.

In course of time a constant succession of remarks and replies on the subject of the weather had emptied the parish house of all its male inmates; the women and children had already gone into the church. The men stood on the gallery in front of the house, almost in silence; no one cared to talk about the errand which had brought them together; so they stood waiting for something in anxious impatience.

Suddenly from the steeple of the church rang out sharply the little bell, and at the sound the men started, and crossed themselves. Then, as if the expected had happened, they moved toward the church, the oldest man leading the way, the younger men struggling to avoid bringing up the rear. Again the bell rang out. It was tolling.

Out of the cloud of dust, along the narrow, worn road, came the yellow hearse, open to the sky, bearing the red coffin, dust white now, wherein slept Armand Hamel. Behind the hearse, in the town's only two-horse vehicle, brought out on great occasions like weddings and funerals, rode the mourners—Xavier Hamel, Philomène his wife, and little Félicie Pelletier, the maiden who was to have been Armand's wife. Had Armand lived but a month longer, Félicie had been their daughter; now she was neither their daughter nor their son's widow.

The men halted awkwardly at the church door, and removed their hats as the hearse drew up. The priest stood on the steps, missal in hand, and placing himself before the coffin, began the office of the dead. Most of the men without the church and the women within repeated audibly their prayers:

"Délivrez moi, Seigneur, de ceux qui me haïssent: que je ne sois point englouti dans l'abîme, et que le puits où l'on me jetta ne se ferme pas sur moi." And again: "Seigneur Dieu, roi de tous les siècles, vous êtes seul plein de bonté; exaucez moi, Seigneur, dont la miséricorde est toujours prête à pardonner; prenez soin de mon âme, et délivrez la."

("Deliver me, Lord, from them that hate me, that I be not swallowed in the abyss, that the pit wherein they have cast me close not above me." And again: "Lord God, King of the ages, Thou alone art full of kindness; hear me, O Lord, whose pity is always ready to pardon; guard my soul, and deliver it.")

Meantime the mourners had entered the church, and were making their way to their seats. They walked slowly, delayed rather by the emotions of the girl than by any weakness of the older mourners. At last they reached their places, and the burial service began.

All this time the clouds that had encompassed the cape came nearer, and more and more assumed the character of rain clouds. The cape loomed up, and the miles of water between it and the church seemed but yards, so near it seemed to be. Edmond put out his hand, as if to touch the great rock; then he looked at the sky, and went into the church.

Everything was strangely still. The voice of the priest sounded as if it came from a great distance. The children, usually restless, sat quietly. The darkness of an approaching storm pervaded the church; the light before the altar burned dimly and uncertainly. Only where Félicie sat, it seemed to the lad, was there any light; around her there was a strange brightness, but he did not feel afraid.

At last the priest closed his book, and the congregation sighed with relief as he descended from the sanctuary and stood at the head of the coffin. Then priest, coffin, and silent congregation left the church, and went through the narrow gate into the graveyard. There a grave had been dug, next to that in which the shipwrecked Portuguese had been buried, and around the grave gathered they all.

In the centre stood the priest and the grave-diggers; next to them were old Xavier Hamel and his wife, Philomène, and between them stood Félicie Pelletier.

"Poor Félicie!" thought Edmond; "she is very young, and so little."

Slowly the old priest read the words of committal, and then the poor red coffin was lowered into its place.

As the coffin disappeared from sight, thunder began to roll. The distant hills, the great cape, were lit up by flashes of lightning, and far away the rain could be seen falling heavily. As yet, however, no breath of its freshness reached the kneeling habitans. A movement ran through the crowd as wind sweeps through standing grain. Women and men looked up timidly; children looked around boldly. Even the priest hastened his utterance, to finish before the storm should break.

Still the thunder rolled. It had not begun suddenly, but slowly, majestically; at first afar off, but ever coming nearer; not a sullen roar, not the ill-humored crashing that some thunder is, but awful and grand.

The crowd rose; the priest's voice was no longer heard in the noise of the thunder. Perhaps he had stopped his prayers.

Then suddenly from the black cloud that hung directly above the congregation burst a flash of lightning—not the forked lightning that strikes down dwellings and crops and men, but a great broad flash, so bright and glorious that all fell again upon their knees, and hid their faces in their hands; so wondrous and awful that they dared utter no sound, but remained silent and motionless.

Only two stood upright—Félicie and Edmond. Félicie had kneeled, weeping on the shoulder of Madame Hamel, while the priest gave back to earth all that had made her life happy. Armand and she had been betrothed so long, their wedding day had been so near; and now Armand was taken from her so strangely and so suddenly. So while the priest read the sacred sentences, and the people who had loved Armand stood about his grave, she whom Armand had loved kneeled and sobbed, hearing not at all the murmured words of Madame Hamel, hearing as if they were spoken afar off the words of the priest. But now that even the priest was terror-stricken and cowering, Félicie stood up, no longer clinging to Armand's mother, and looking up into heaven, she spoke to the thunder.

"My Father," she said, or so it seemed to the lad, who stood almost by her side.

And, as if in answer, the thunder, which had not ceased to roll, crashed yet again, and the echoes rolled back from the cape, and died away slowly in the distance, and all was silent. And Félicie spoke again, but the lad could not hear what she said, and she bowed her head.

Again the thunder answered, a majestic peal, yet not to make those who heard it afraid. But Félicie said nothing more; she stood with her face turned to the dark sky as if in expectation.

Then came a blinding flash of lightning. For an instant only dared the boy look; then he clasped his hands over his eyes, and fell upon his knees. But in that instant he saw Félicie standing in the midst of the glory of the great brightness, smiling, and above her was a great rift in the clouds. Further than ever before could the lad see on high; then he pressed his hands to his eyes, and sank upon his knees, and cried aloud in terror.

When the lightning had become dim, and the thunder had died away, came the rain. In torrents it fell, and all sprang up, forgetting Armand almost and Félicie, thinking only that the drought was broken, and rejoicing. But when they saw Félicie they remembered everything, and stood still, as if abashed.

Félicie stood at the head of the grave. Her hands were clasped before her; her face was lifted up, and she was smiling. What she looked at, what she saw, no one could tell.

The priest approached her almost timidly. "Félicie," he said, but she made no answer. "Félicie," he said, more loudly. And again, more loudly still, "Félicie."

As if he feared that she had been struck dead, the priest laid his hand on her arm. She moved, and he gave a sigh of relief.

"Félicie, come with me," he said; but the girl moved not, nor made as if she heard him. The people came nearer and looked at her, almost with terror.

At last the maiden lowered her eyes and looked toward the priest; he looked her full in the face, and his cheeks paled.

"Félicie," he said, imploringly, "do you see me? Do you hear me?" But still she made no answer.

"What is this?" murmured the priest, hoarsely; and Edmond, the half-witted boy, answered him:

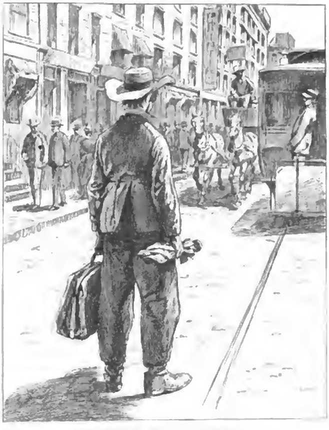
"Father," he said, touching the priest's arm, "Félicie has seen God, and heard Him speak, and spoken to Him. I do not think, father, that she can see you or hear you; your face is not bright enough for her eyes to see; your voice is not loud enough for her to hear."

The priest turned to the lad suddenly, and the boy stepped back, abashed; but the priest held out his hand, and the boy took it and held it.

"My children," said the priest; and at his words the crowd knelt in wonder on the earth, no longer dry; and the priest spoke: "The Lord hath spoken in the thunder to Félicie; He hath appeared to her in the lightning. What ears have heard the Lord, them hath He sealed; what eyes have seen the Lord, them hath He closed; what tongue has spoken with the Lord, that hath He silenced. Not on earth can those ears hear, those eyes see, that tongue speak.

"Listen, my children; Félicie hath heard God, and she is deaf; she hath seen Him in His glory, and she is blind; she hath spoken with Him, and she is dumb. But it is no grief to Félicie that this is so; for the words of the Lord have comforted her in her sorrow, and made all earthly words unfit for her to hear; His glory makes dark all mortal things to her; the tongue that has spoken with God must speak with no mortal man. Blind, then, is Félicie, deaf, and dumb; yet pity her not, my children, for the hand of the Lord is upon her gently; He hath honored her above all women, save only one, and to-day, more than ever before, is she happy; to-day is she in very truth Félicie."

In silence the people heard the priest, and when he had spoken the benediction, in silence they went to their homes, thinking much. Then old Xavier Hamel and his wife Philomène took Félicie to their home, and she was as their daughter; and the people thought not of her as one unhappy, but as one honored greatly by God, and chosen out to have her sorrows turned to joy. But Félicie neither saw nor heard nor spoke again on earth; and in God's time she fell asleep, to meet, awaking, Armand.



"GETTING THE WORTH OF HIS MONEY."

HAYSEED. "What do yer charge to the Battery?"
CONDUCTOR. "Five cents! Hurry up!"
HAYSEED. "Is it the same from Central Park?"
CONDUCTOR. "Yes. Hurry up, can't yer?"
HAYSEED. "I guess I'll walk to Central Park, and take a car from there."

A DAY IN A TANNERY.—[See Page 74.]

on his honest head seemed to rise in terror. His kind gray eyes grew suspiciously moist. He did not utter a sound, but grasped his hat, sprang down the dingy old staircase at a pace which threatened immediate destruction to that ancient avenue of exit, and in precisely half an hour returned with four ten-dollar bills, which he gravely presented to me without a word. How the good soul managed to obtain so much money in so incredibly short a space of time has long been a matter of conjecture with me. I was half inclined at the time to believe that, fired by my tale of want, he had yielded to the impulse of the moment and committed a murder, or at least a robbery. Taking it all in all, I decided that this was a wise and affluent time to retire. As there had never been anything definite about my work or my pay, I did not realize the necessity for a formal resignation, and therefore simply remained at home. The editor never sent to inquire the reason for my absenting myself, and thus ended my first lesson as an "associate editor."

The next time I was thrown out of employment as a society reporter I had plenty of company, as more than one hundred persons lost their means of obtaining a livelihood at the same time by the total collapse of a morning paper. I then turned my attention vigorously to the matter of obtaining general reportorial work, and it was then that my struggles began in earnest. The others had been but a mere bagatelle in comparison. In vain I continued to present myself to managers day after day, and to endeavor to push my claim by means of every plan known to the mind of woman. The fact was plain; they would have none of me. The articles I tendered for publication were accepted and printed, but not paid for. The principal objection raised wherever I applied was that I was a woman, and consequently disqualified for reportorial work. Another plea on the part of managers was that I was a book writer, and consequently too impractical to make a good reporter. In the several years that had elapsed I had managed to publish a small book of sketches, and this now appeared as a stumbling-block in my way. "A book writer will never make a reporter," one manager said to me, brusquely; "people with literary taste are too fanciful for plain news-gathering"; and so I was cast out for being *literary*, a crime which had scarcely been laid at my door by the score or so of publishers who had returned the manuscript of my novel several years before.

It is a geological fact that adamant succumbs at last to the power of water, and so, little by little, inch by inch, I finally worked myself into the position of general reporter on the staff of a large and enterprising morning paper. In just five months from the time I had made my first bow in the paragraphs of the inevitable "society column," I had my hands so full of work that I scarcely had time to eat or sleep. This sort of thing extended over a period of several years, and embraced a list of varied experiences, many of them interesting and remarkable. A year or so ago I enjoyed the somewhat lurid reputation among the newspapers of being "the smartest girl reporter in the Union." This title, which originated in an article published in St. Louis, travelled throughout the length of the United States and Canada, and resulted in bringing me several remarkable offers of marriage from far-off climes. One of these missives was indited by a gentleman in the Indian Territory, who didn't want a wife simply to pose as a lay-figure in a drawing-room; but, on the contrary, longed to lay his devotion at the feet of a woman who knew how to "hustle." Another came thick with the perforations of Mississippi quarantine, and contained a paragraph which read very much like this, "I am a Southern-raised man, but I desire to secure to myself the affections of a woman whose noble character has been formed amid the spruce-laden regions of the far North, and who is not afraid to soil her pretty hands with what Mississippi belles are apt to regard as the contaminating influences of work." The foregoing are very fair samples of the epistles with which my desk was deluged for weeks after I became known to fame as "the smartest girl reporter." These and pathetic appeals from struggling, ambitious girls for advice and practical aid made up the sum of a large correspondence. In the latter there was an undercurrent which might well furnish a key to some rich philanthropic woman surfeited with elegant leisure, and longing to do some earnest part of the world's work.

When I finally decided to come to New York, I was warmly advised by the editor of a prominent magazine not to seek employment by personal application, but to rely rather upon the influence brought to bear by the presentation of letters received at the hands of prominent men. For the benefit of others, I desire to state that I followed this friendly but mistaken advice for some time, and that a more erroneous plan, at least so far as my experience goes, was never conceived. The first missive of this kind which I had the hardihood to present was one that had been given me to one of the best-known managing editors in the city of New York. After having proved my credentials satisfactorily, I was given a chair in a corridor, where I remained just three-quarters of an hour before the object of my visit had time to see me. At the expiration of that time he appeared, kindly offered me his hand, invited me into the sanctum, and—asked me about myself, and my mission in New York? Not at all; proceeded to tell me that he had six women on his staff, only one of whom ever took an assignment without offering the most annoying remonstrances, etc. He felt obliged to keep them because they were all supporting somebody, etc., but he hated to see women around a newspaper office, and he thought those contemplating such a career should be promptly discouraged. This important conversation occupied just twelve minutes. He then looked at his watch, told me he had an engagement, asked me to come at a certain hour the next day, and bade me a cordial adieu. When I called the next day he was too busy to see me, and this I doubt not is the experience of many.

"Get a letter from X——, the rising humorist," my friend of the magazine said to me one day; "it will do more for you than you can accomplish in a year."

I referred to this soon after to a popular poet, who is intimately connected with Mr. X——, the humorist, saying that I had met the latter, but that he would doubtless have forgotten me long ago.

"Mr. X—— never forgets anybody," cried the poet, with all the warmth which characterizes the songs he sings in verse. "He will give you letters, and do everything in his power for you." But notwithstanding this burst of fraternal indignation, Mr. X—— had forgotten me, and refused point-blank to do anything for me in the way of a letter; which shows conclusively, I might add, that he is a wise man as well as a funny one.

An old school-mate, now a Congressman, upon being informed that I had come to New York, made haste to post me a letter to a prominent New York editor with whom he had been intimately connected, both politically and socially. That letter was left on the library table of the great man to whom it was written, and doubtless met swift oblivion in the waste-basket when it attracted his attention upon his return from the country the next day. At least I never heard of it more.

About this time I met a successful young newspaper woman, who advised me to throw my letters in the fire, and proceed on my own plan. I did so, and for a time it was a question in my mind as to which method of procedure was the more ill-advised. At the first office where I applied unintroduced for work, the brusque but genial city editor assured me that he had no vacant chair, but advised me to go to a neighboring office, as the quickest means, I suppose, of getting rid of me.

At the office of one of the most famous newspapers in Gotham I was assured by the city editor that none of the fortunate people of whom he had control ever died, and that there was not the slightest possibility of my ever being able to obtain employment there. To do this gentleman justice, I am compelled to state that he gave me this chilling refusal sorrowfully, as if it were a matter of regret that his mission must perforce be that of breaking the hearts of the working masses by refusing them employment. Greatly touched by this exhibition of feeling, I hurried away to the office of another great organ of the people, where I was told that nothing like regular employment could be had, but that if I chose to submit special matter it would take its chances with the rest.

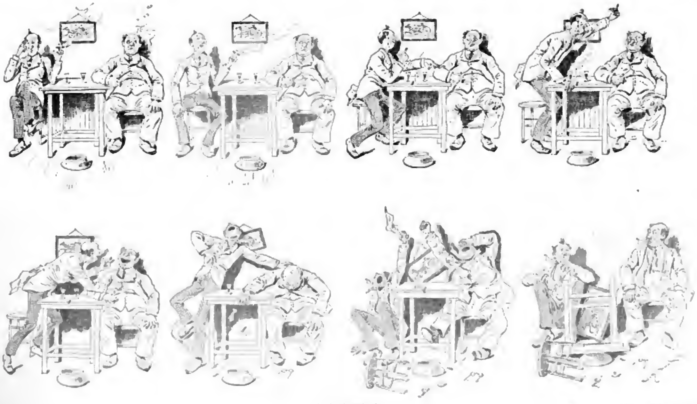
The editor of another paper wanted nothing but sensations, and took occasion during my visit to insist that any reporter could scare up a genuine local sensation in the course of an hour or two, if he would only set himself about it. For instance, the old cruller woman at the corner had a history with a sensation in it. Everybody had, he said, if only the reporter had wit enough to get it out of them.

At the office of a well-known story-paper I was informed by the editor's clerk that writers of reputation need not apply, because the publishers paid only from $3 to $10 per story. I escaped, and made my way to the office of an evening paper, where the busy city editor told me that he and his colleagues were always ready to employ bright, capable people. He asked me if I had a subject at my finger-ends, and when I told him that I had, he gave me an order for the article. I collected the data for that bit of composition with great pains, and having written the article, carried it to him on the day appointed for its delivery. His eyes wandered restlessly up and down the first page, and he then proceeded in the most gentlemanly way imaginable to pronounce my doom. He was sorry the idea had not occurred to him before; the article was well written, and would doubtless prove available in most offices; but he feared—yes, he feared it would conflict in some measure with a certain class of advertising.

I am afraid that all this must sound very discouraging to those who come unknown to New York seeking newspaper employment, but on the day which closed the first fortnight of my stay in Gotham, my name was placed on the regular assignment book of the city editor of a well-known newspaper, and my daily work among the sights and scenes of this great city was well begun. J. L. H.

THE BABY KING OF SPAIN.

DEATH has knocked sharply at the gates of the royal palace at Madrid, but so far has not entered. Perhaps it would be a fresh illustration of the force of the ancient saying, "Whom the gods love die young," should Alfonso XIII., now reigning in Spain by a legal fiction, pay his natural debt while yet an infant. The crown resting on its velvet cushion by the side of the smiling babe in the striking picture by the painter Domingo, which is reproduced in the WEEKLY, is full of sad presage. It has been a true crown of thorns to many of its wearers since the proud days of Charles V., when the Spanish monarchy was at the pinnacle of its power and splendor. All the portraits of Spanish kings are shadowed with a look of deep melancholy, in part perhaps the inheritance of race, but in no small measure the imprint of the fears and sorrows which have made royalty a burden. The infant monarch, whose Austrian mother Maria Cristina has won her desert in the affections of the Spanish people, was a posthumous child, born May 17, 1886. Queen Cristina had already borne two children, both daughters; the elder of whom, Maria de las Mercedes, was declared successor to the throne, under her mother's regency, failing the male heir who was then hoped for. The birth of Alfonso XIII. for the time stilled the disloyalty and brewing discontent which had darkened the closing years of the preceding reign. The chivalry of the Spanish people was fired by the tender spectacle of a young mother who had given a male heir to the kingdom, and the force of sentiment—so powerful an impulse among the modern Latin races in public affairs—postponed what the logic of the age threatens as inevitable. The little Alfonso, it is said, has inherited the frail constitution of his father, which had been further sapped by excesses. It is more than an even chance that should he recover from his present illness he would not live to his majority, which by Spanish law is sixteen. It may be that the numerous classes of malcontents, ranging from Carlists to republicans and socialists, will discount this expectation by refraining for a while from the more violent forms of revolution. In case of the young king's death, a crisis in affairs may be looked for at an early date, and a republic would probably be declared by one of those rapid pronunciamentos which so often stir the politics of the Spanish races. It is hardly to be expected that the pretender, Don Carlos, with the backing of the bigoted people of the northern provinces, where he is still a latent power, would remain quiet at the upheaval. It is even now announced that he has concerted a plan of action pending the occasion. If this does not mean another independent rising, it would probably result in the betrothal of Don Jaime, the son of Don Carlos, to the Infanta Mercedes, who would then be the legal heiress, and the union of the two royal claims. Should the infant king survive the perils of a rickety constitution, the outlook for quiet times on the Iberian peninsula is none the more promising. Alike in Spain and Portugal the forces of republicanism are gathering swiftly to a head, and whether the revolution takes an orderly or a violent form, it needs no sage to see its sure approach. The Brazilian *coup d'état*, which amazed the world, has been a terrible alarm to the powers that be, and a no less terrible stimulus to the powers that would be. The fuel lies ready, well-seasoned, and it only needs the torch. Señor Sagasta, the Spanish premier during the whole of the regency, has proved a sagacious and masterful statesman, but



A GOOD STORY

THE LATE WALKER BLAINE.
From a Photograph by Bell, Washington.

the elements of disturbance have already proved themselves too turbulent for his control. Whether, then, the infant royal of Spain lives or dies, the early future seems big with tragic issues. It seems difficult to associate the smiling baby face, with the royal baubles of crown and sceptre resting close at hand, with scenes of turmoil and bloodshed involving the fate of a nation. For the little Alfonso the pretty and touching tyranny of the nursery is the only field in which he has waved his sceptre. Perhaps it will be the kindest boon of destiny if he is forever precluded from any possibility of its exercise other than that which the plebeian shares in common with the child born to the purple.

WALKER BLAINE.

Walker Blaine, Examiner of Claims in the Department of State, died on Wednesday, January 15th, in Washington, D. C., at the residence of his father, the Hon. James G. Blaine, Secretary of State. The cause of his death was acute pneumonia, superinduced by an attack of the prevailing epidemic. The dangerous symptoms did not fully reveal themselves until the day before his death, which occurred almost without premonition in the evening. He had resided much of his life in Washington, and his sudden death was a great shock to a large circle of friends, who were not aware until the day he died that he was seriously ill. The sudden fatality of his illness was probably due to the fact that when attacked he was not in good physical condition to withstand the disease. He had not fully recovered from an accident in the past spring, by which his leg was broken, and from an attack of malarial fever, from which he had suffered during the autumn.

Walker Blaine was the eldest son of the Hon. James G. Blaine, and he was nearly thirty-five years of age, being born in Augusta, Maine, May 8, 1855. He prepared for college at Phillips Academy, Andover, Massachusetts, and entered the Harvard class of 1876. From there, after a year's stay, he went to Yale, where he was graduated in 1876. In college he was popular among his classmates. His manners then, as always afterward, were cordial, frank, and unaffected. He was graduated from the Columbia Law School in 1878, and he spent the next two years in St. Paul, Minnesota, as a student in the law office of Cushman K. Davis, now U. S. Senator from Minnesota. When scarcely of age, and just after his admission to the bar, he made an argument before the *Alabama* Claims Commissioners, which won him great and deserved commendation.

He entered the public service in 1881, when his father, Secretary of State in President Garfield's cabinet, appointed him Third Assistant Secretary of State. Upon the resignation of his father he retired from office. In the winter of 1881–2 he was sent with William Henry Trescott as a special commissioner to South America, with instructions to use the good offices of the United States in the effort to effect a settlement of the troubles between Chili and Peru. In the course of his stay in South America he was Chargé d'Affaires in Bolivia for several months. On his return to the United States, late in the year 1882, President Arthur appointed him one of the assistant government counsel before the Court of Commissioners of the *Alabama* claims, an office for which he was especially well fitted because of his knowledge of international law. He served in this capacity until the court closed its labors in 1884.

For the following four or five years he was engaged in the practice of law in Chicago. Shortly after the election of Harrison to the Presidency he returned to Washington, and when his father resumed the foreign portfolio last year Walker Blaine was appointed Examiner of Claims in the State Department, vice Francis Wharton deceased. In this position, which he entered upon March 11th last, he was the legal adviser of the Department, and confidential representative of the Secretary. The regard in which he was generally held was shown when his nomination to his last office was sent in to the Senate, that body, on motion of Senator Edmunds, doing him the unusual honor of confirming the nomination at once without reference to a committee.

After reaching manhood Walker Blaine was his father's most intimate friend and confidant, and he practically relieved the Secretary of all the routine work of the State Department. He furnished an instance comparatively rare in America of a young man's systematically preparing for a diplomatic career by perfecting himself in the details and routine of the whole working system of the office of the Secretary of State. For the attainment of his ambition he had unusual advantages, owing to his father's prominence in public life and familiarity with foreign affairs. He was a valuable assistant to his father in the conduct of delicate private business of the Department. He stood between the Secretary and the politicians, discharged his duties discreetly, and was accessible at all times to people having business with the Department. He had developed in the last few years a decided aptitude for the public service, and it was believed by his friends that he was certain to achieve a brilliant diplomatic career.

Although of slight physical build, Walker Blaine in outward appearance greatly resembled his distinguished father. For many years he was a conspicuous figure in Washington official and social circles. Possessing good natural abilities, high attainments, and rare tact, he was highly respected by all who knew him, and most by those who knew him best. He was affable, polite, patient, a ready talker, and a willing listener. He has left a record of which his kindred and friends have a right to be proud, and which will always endear him in their memories.

Upon the tidings of his death many people of distinction visited the house of the Secretary of State to tender their condolences, and throughout the remainder of the evening on which he died there was a procession of carriages before the door. Among the visitors were the President and Mrs. Harrison, the Vice-President, the Chief-Justice, and several members of the Cabinet and of the Maine delegation in Congress. Messages of sympathy have been received from every part of the country expressive of the affection and esteem in which Walker Blaine was held. At the University Club of New York, of which he was a member, the feeling of sorrow was strongly marked, and from Augusta, Maine, his birthplace, were sent many expressions of grief.

Mr. and Mrs. Blaine and the remainder of the family were completely overcome by grief at their loss, so great and unexpected. This is the third affliction through death that has visited them within a short time. Several weeks ago Mr. Blaine's brother died, and soon afterward Mrs. Blaine's sister. In the heavy blow that has fallen upon the Secretary of State and his household the whole country has forgotten politics and policies in a profound and general sympathy for the afflicted family in their great bereavement.

BLIND POOLS IN DISREPUTE.

The disagreement between the security holders and the management of the Philadelphia and Reading Railroad Company that came to the surface at the annual meeting of the company this week has redirected the attention of investors, and indeed of every one interested in such matters, to a tendency that has of late been increasing. A year ago the holders of railway securities seemed to wake up pretty generally to the necessity of taking an active personal interest in the management of the corporations which they own. Since then there appears to have been a gradual return to the lethargic condition that characterizes the average holder of corporate securities. Among the causes that have checked the awakening referred to, possibly the most effective, both in this country and abroad, has been the large interest taken in so-called industrial enterprises. In this country that cause has been intensified by the manner in which those enterprises have been placed before the public. The most important of them, and those which the public has come to know best, have been exploited upon the Stock Exchange in the form of Trusts. They have all, in one way or another, given promise of large profits to those who might invest in them.

The unfortunate phase of the management of these undertakings has been the almost general withholding of definite and official information regarding them. Those who organized them and are responsible for them before the public have, upon various pretexts, endeavored to justify a policy of reticence, if not of actual concealment. The schemes were all new to the speculative community, consequently they were taken hold of rather eagerly, and principles that should have been applied to them have been ignored. In fact, the strongest element of danger in them, namely, secrecy, or the mystery resulting from it, has appealed to and fascinated the speculative mind. Within the last few months public sentiment regarding the methods of the management of these concerns has undergone a change. The disastrous results of speculation in most of the Trust certificates have gone a long way toward convincing the public of what it should have been mindful of at the start, namely, that it is not possible to conduct any business successfully in violation of well-established principles. It has been claimed in defence of the Trust idea that the basis is the same as that of a copartnership, but there has been this difference in practice between an ordinary business partnership and one designated as a Trust. In the first case, every partner is advised constantly of the progress of his business. In the case of a Trust the number of certificate-holders who know or are able to learn the tendency of its business is exceedingly small. As a rule the qualification for obtaining that knowledge is a trusteeship. The Cotton Oil Trust made two annual statements before it decided to reorganize as a corporation. The last one nearly paralyzed its certificate-holders. The Lead Trust will, it is understood, submit a statement of its condition and operations to its certificate-holders at their annual meeting in February. The Sugar Trust, however, has never made an official statement of which the public has obtained even an inkling, yet its certificates seem to have been distributed more widely than those of any of the others that have obtained the sanction of the Stock Exchange. The distribution has doubtless been facilitated by the fact that from its formation the Sugar Trust has paid ten per cent. per annum upon its enormous capitalization of fifty million dollars.

Right here attention must be called to the fact that the English method of managing industrial undertakings on a large scale demolishes the argument of the managers of domestic Trusts that secrecy is essential to the success of their combinations. In England every concern of the character under discussion is subjected to rigorous official accounting, and the holder of the smallest number of certificates is entitled to the same information as the holder of the largest amount. Now that the losses upon this class of securities have assumed enormous and distressing proportions, the desire for facts has revived, and the movement in favor of publicity regarding the affairs of every concern the ownership of which is distributed among the public has received fresh impetus. It would be hazardous to predict that the Trust idea had been tried and found wanting, unless the advocates of Trusts insist that secrecy is an essential element. But the assertion can safely be made that, after last year's experience with blind pools, the public will insist upon being informed as promptly as circumstances will permit of the tendency and results of every business in which it is engaged, whether upon the basis of a copartnership or of a joint-stock company. And if the public feels like insisting upon having the facts, it should also insist upon the selection of trustees who will not convert their office into a means for private gain.

Both issues are clearly raised in the imbroglio in which the management and many of the largest holders of Philadelphia and Reading Railroad securities have become involved. The earnings of a part of the Reading system—its mining department—have been suppressed since last spring. In default of their publication, the security-holders of the company have, in an authoritative way, been led to expect results different from those that were announced only a few days before the annual meeting. The charge upon which the management has been arraigned is really that of suppressing the reports of earnings; but an attempt to change the Board of Managers was rendered absolutely futile by the voting trust in which the stockholders of the company have tied themselves up until 1892. It is to be hoped that the litigation that has grown out of these disgraceful events will be pushed until a final ruling is had relative to the legality of voting trusts.

It seems rather surprising that in the face of these recent developments the financial sponsors for the Atchison Railroad system should propose to establish a voting trust, and make a determined effort to commit the stockholders of that company to a policy that has invariably proved to be pernicious. In doing so they disclaim any desire to accept the very responsibility that they invite. They should be taken at their word in the first instance, and permitted to retire from their voting trust scheme as gracefully as they can. Unfortunately for them, the fashion of placing blind confidence in self-selected trustees was badly damaged before they adopted it, and their mistake in doing so will be the quicker forgotten if they cast it aside, and throw their influence in favor of absolutely untrammelled methods in the selection of corporate officers and an open and straight-forward accounting between trustees and the stockholders who employ them.

Collin Armstrong.

New York, Saturday, January 18, 1890.

NATURE IN CONVULSION

Is terrific. Volcanic eruptions, cyclones, earthquakes are awfully and tremendously picturesque, but scarcely desirable to emulate in action and effect by the administration of remedies which produce convulsion and agony in the abdominal portion of the human frame. Such is the effect of the old-fashioned violent purgatives happily falling more and more into disuse, and of which Hostetter's Stomach Bitters is the wholesome, pleasant, and far more effective succedaneum. They weakened the intestines—the Bitters invigorates them. They left the bowels inactive, because incapacitated by ensuing feebleness. The Bitters, on the contrary, and because it enables, not forces, them to act—a vast and fortunate difference—perpetuates their activity and regularity. The liver is beneficially stimulated, as the kidneys also are, by this medicine, which easily conquers, also, malaria, nervousness, and rheumatism.—[*Adv.*]

A HANDSOME FACE.

Lady reader, are you annoyed and oftentimes embarrassed by imperfections in your complexion? Have you been placed in positions where you envied those of your sex whose complexions were more presentable than your own? Have you felt chagrined because of facial defects, or at compliments bestowed upon companions, in your presence, to your utter neglect? Is your face sallow, murky, blotched, or freckled? Is there roughness, redness in spots, or undue paleness of the skin? Is your complexion tanned, through exposure, or chapped and abraded by the wind or change of weather? Are you annoyed with wrinkles or threatened with them? Is your face, or any part of it, afflicted with blackheads or flesh-worms, spots, or discolorations? Is your skin flabby, and sometimes greasy, and your complexion bad generally? Is your face coarse, or dry and parched, and does it present an unhealthy appearance? Do you feel nervous and irritable at times, especially in company, from the knowledge of a bad complexion or skin defects of one kind or another? Are you using powders, cosmetics, etc., which are gradually ruining your complexion, and which serve only to "make up" a *false face* for the time being. Why tolerate a bad complexion, or any imperfection of the skin, when the use of a simple appliance like Madame Rowley's Toilet Mask, or Face Glove, will in a short time make your complexion almost as pure and faultless as an infant's? The Toilet Mask is rapidly taking the place of injurious cosmetics, or "complexion destroyers," as they may be properly called, and its field of usefulness is becoming broader year by year as its value and virtues become more widely known. Can you afford to continue expending money regularly for preparations which are sure to injure, if not ruin, your complexion, when for a moderate outlay you can become the possessor of the Toilet Mask, the only true beautifying agent, which will, by improving, perfecting, and preserving your complexion, save you money, annoyance, and mortification? The Toilet Mask imparts freshness and beauty to the skin, prevents and removes wrinkles, and all complexional defects, leaving the skin soft, clear, beautiful, and brilliant. Valuable illustrated treatise, containing proofs, medical and scientific endorsements, and full particulars, mailed free, by The Toilet Mask Co., 1162 Broadway, New York.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

IMPERIAL GRANUM
Is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged. [*Adv.*]

COUGHS.
"Brown's Bronchial Troches" are used with advantage to alleviate Coughs, Sore Throat, Hoarseness, and Bronchial Affections. 25c. a box.—[*Adv.*]

When baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Nicholson's Liquid Bread is a luxury within the means of all. It combines the refreshing qualities of a pleasant drink and the invigorating qualities of a pure malt extract.—[*Adv.*]

CORNELL'S BENZOIN COSMETIC SOAP.
For the complexion and skin. 25 cents.—[*Adv.*]

Beecham's Pills.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[*Adv.*]

Add 20 drops of Angostura Bitters to every glass of impure water you drink.—[*Adv.*]

Dr. Lyon's Perfect Tooth Powder. Whitens the teeth and purifies the breath. 25 cents.—[*Adv.*]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits. 25c. a box.—[*Adv.*]

Leading physicians recommend Ayer's Sarsaparilla. Old and young take it with perfect safety. It cleanses the blood, strengthens the nerves, and vitalizes the system. Popular experience has long placed this medicine at the head of tonic alteratives.—[*Adv.*]

THE ROTARY SNOW-PLOUGH AT WORK ON THE CENTRAL PACIFIC RAILROAD.—Drawn by Charles Graham.—[See Page 91.]

JUST PUBLISHED.

LIBRARY EDITIONS
OF THREE POPULAR NOVELS.

I

A HAZARD OF NEW FORTUNES. A Novel. By WILLIAM DEAN HOWELLS, Author of "Annie Kilburn," "April Hopes," etc. 2 vols., 12mo, Cloth, $2 00.

Never, certainly, has Mr. Howells written more brilliantly, more clearly, more firmly, or more attractively than in this instance.—*N. Y. Tribune.*

II

PRINCE FORTUNATUS. A Novel. By WILLIAM BLACK, Author of "A Princess of Thule," "Sunshine," etc. Illustrated. 12mo, Cloth, $1 25. (*Popular Edition, Illustrated, 8vo, Paper, 50 cents.*)

He who does not like it must be hard indeed to please.—*Boston Herald.*

III

KIT AND KITTY. A Novel. By R. D. BLACKMORE, Author of "Lorna Doone," "Springhaven," etc. 12mo, Cloth, $1 25. (*Popular Edition, 8vo, Paper, 35 cents.*)

In "Kit and Kitty" Mr. Blackmore reverts to his early simplicity of style that charmed the lovers of "Lorna Doone."—*Philadelphia Ledger.*

McCARTHY'S FOUR GEORGES.

A HISTORY OF THE FOUR GEORGES. By JUSTIN McCARTHY, Author of "A Short History of Our Own Times," etc. Vol. II. (uniform in style and price with Vol. I.), 12mo, Cloth, $1 25.

As fascinating as an ably written romance.—*Boston Journal.*

ANCIENT LITERATURE

ILLUSTRATED HISTORY OF ANCIENT LITERATURE, ORIENTAL AND CLASSICAL. By JOHN D. QUACKENBOS, A.M., M.D., Adjunct Professor of the English Language and Literature, Columbia College, New York. Accompanied with Engravings and Colored Maps. *New Edition, Revised and Enlarged.* 12mo, Cloth, $1 50.

The book has been enlarged by the addition of a carefully selected bibliography. The maps, diagrams, and text have been revised so as to reflect the results of investigations carried on by specialists since the publication of the first edition over ten years ago. This is especially noticeable in the chapter on Egyptian literature.

THE POLITICAL LULL.

THE public situation is singular. As we write, there is no practical measure of importance pending in Congress, although the scheme of revised rules will be probably under discussion when this paper is issued, and possibly an election bill. The newspapers are commenting upon policies not yet practically proposed, like the tariff, which we have always with us, or a Southern electoral law. The practical comments of the moment, however, are upon the President's exercise of his power of appointment and removal, and upon the scheme which properly has no political character whatever—the World's Fair of 1892. The calm will not long continue. It may be disturbed simultaneously with the issue of this paper by the agitation of the new rules of procedure in the House of Representatives. The principles which should be regarded in those rules are too evident for debate. The only question will be whether those principles are plainly respected by the proposed scheme. The essential points are two. The majority must be assured the right of voting without unreasonable delay, and the minority must be assured the reasonable right of debate. We say reasonable, because all parliamentary experience and parliamentary rules show that there is such a thing as unreasonable debate. It is obvious that without some method of stopping discussion all legislation could be prevented, and the very purpose of a Parliament or Congress frustrated.

The sympathy of intelligent citizens will support the rules which are to be proposed, if they shall fairly secure the two rights which we mention, without trick or subterfuge. The majority, while maintaining its unquestionable right of decision, must be moderate, and the minority must beware of a seductive fallacy. The plea of filibustering, or what is really revolutionary resistance to the parliamentary majority, is that it is intended to prevent tyranny and injustice upon the part of the majority. The answer to this allegation is that the majority is not responsible to the minority for its misconduct but to the country, while the prevention of legislation by the minority under any plea whatever is subversive of popular government. Consequently the majority must be able to end talk and to take action, even to adopt what the minority may hold to be unconstitutional, revolutionary, or unjust legislation, being accountable to the country, which will correct the evil by electing Representatives to repeal the law. This is the only practicable doctrine of popular parliamentary proceeding. Any other would annul the fundamental principle of government by the majority.

The majority, however, will be very foolish if it attempt in any way to restrain reasonable debate. It is very true that important legislation in Congress is a foregone conclusion. The majority is a party majority, and through its agent, the Speaker, appoints party committees, whose recommendations practically conclude legislation. When an important bill is reported, therefore, the result of the vote is foreknown by both sides; correction of detail may be made, but it is very seldom that a bill of importance reported by a party committee is defeated by the party majority. In this situation it is felt that debate is not a discussion of merits which, according to the force of the argument, will determine the passage or the rejection of the bill. It is an opportunity embraced by the minority for a party appeal to the country, to effect, perhaps, in the constituency what it cannot effect in Congress. Representatives are elected because their minds are already convinced, not because they are open to conviction. If a Republican elected as a protectionist should honestly yield to the force of argument and vote for a revenue revision of the tariff, he would be denounced as a traitor, and so *vice versa* on the Democratic side. The fiction of debate, therefore, must not be taken too seriously nor pushed too far by the minority. The majority has the right to legislate, and the minority has not the right to prevent legislation.

A TRANSFORMATION SCENE.

WHOEVER looks at the map of South America, and sees how enormous a part of it is occupied by Brazil, and then reflects upon its immense natural resources, will feel that the present political situation in that country is of very great importance. Like all great and sudden revolutions, the late revolutionary movement has been already felt elsewhere, and the final result is a matter of the highest interest and speculation. Every day confirms the good sense of the course taken by our own government, which is simply that of friendly anticipation. There are excellent newspaper correspondents upon the ground, and none better than Mr. GILSON, of the New York *Times*, who has the felicity of saying what the public naturally wishes to know. The estimated population of the country in 1888 was about 14,000,000; of these there were 220,000 qualified voters, and of these not more than 500 were aware of the scheme to overthrow the empire. In no sense whatever, therefore, was there a spontaneous popular movement to overthrow the government.

There was, indeed, a very general impression that the empire would not survive the Emperor, but this feeling was that of intelligent persons who also believed that the country was not ripe for republican institutions. That, however, is apt to be the feeling of intelligent people under any monarchical system which is not outrageously oppressive. But the fact, we are assured, is indisputable that of the 14,000,000 people in Brazil, not more than 500,000 are of sufficient intelligence to qualify them for the highest duties of citizenship, and of these 500,000 only a very few comprehend local self-government—the tap-root of a republic—or can conceive government without central authority. This situation is evidently understood by the chiefs of the provisional government, who have delayed the meeting of the Constitutional Assembly until a year from the date of the revolution, and in the mean while, by edicts and the formulation of constitutional provisions, are striving to prepare the public mind for republican institutions. Suffrage is extended to all who can read and write, and all foreigners who were in the country at the date of the revolution are made citizens, and consequently voters. But even with this liberality the number of voters, it is estimated, will not exceed a million, and of this number foreigners will be a very considerable proportion. This shows the general illiteracy of the country, and the consciousness of the leaders that they must depend largely upon the intelligence of foreign residents.

Dom PEDRO's character is more clearly disclosed by later accounts. He is described as a very amiable, humane, superficial man, a smatterer in accomplishments, benevolently bent upon the emancipation of the slaves, but not of comprehension to grasp the real situation of the territory, nor of power to control it. The imperial government was corrupt throughout. The smallest service was not rendered without a fee. The judges were systematically bribed. Even had the Emperor been a man of greater ability, his instruments were untrustworthy. This is the people and these are the traditions of government from which a republic is to be constructed. Mr. GILSON thinks that the best to be expected is an improvement upon the Spanish American republics. The people are not turbulent nor likely to create disturbances, and among the leaders are really able and patriotic men, who will try honestly to solve wisely the two great problems, the public revenue and the division of lands, which will be very difficult. They will hope to attract immigrants by free and honest government and cheap lands. Meanwhile no serious attempt to restore the old monarchical régime is to be apprehended. There was general respect for Dom PEDRO as an excellent man, but it was universally recognized that he was not a good ruler, and it was known that his mind was weakened. There is no more interesting political spectacle than the change which Brazil is now undergoing.

READY FOR INVESTIGATION.

MR. HOUK, of Tennessee, and Mr. EWART, of North Carolina, are very anxious that the Civil Service Commission shall be investigated, and the ardor of their desire is surpassed only by that of the Commission itself. The three Commissioners met Mr. HOUK and Mr. EWART in the room of the Committee on Reform, and earnestly requested the most thorough inquiry. Mr. HOUK is evidently unfamiliar with the law and with the purpose and history of the reform movement. He was apparently unaware that appointments are made, not upon examination only, but upon the test of actual trial after examination. The examination does not determine the appointment. It merely furnishes presumptive evidence of fitness. In the old system no other evidence of capacity or fitness is required than the request of a politician who wishes to reward a henchman with the emoluments of a place.

Mr. HOUK said, as reported, that if he were an officer he should wish to know the qualifications of a subordinate whom he should appoint. Undoubtedly; and how would he more probably ascertain those qualifications, by the winks of a boss or a party committee signifying that a worker must be "recognized," or by the certificate of an impartial examination and of actual trial? If Mr. HOUK would look into the subject a little he would discover that all his objections have been a thousand times candidly considered and completely demolished. He said that no business concern would think of such a method of appointment as that of the reformed system. But he is mistaken because not only is a system of independent examinations adopted by certain great companies, but no man of business in his senses would ever appoint a clerk in the manner or for the reasons that public employés are selected under the spoils system. Moreover, he knows that the public appointing officer is not an agent in such matters. A Secretary of the Treasury once made the same objection that Mr. HOUK urges, but upon being pressed admitted that he did not make appointments because of his personal knowledge and satisfaction, but because of the necessity of gratifying Senators and other people of importance.

The immense multitude of appointments are made not upon personal knowledge, but upon information, and the information derived from a fair examination and trial is very much superior to that obtained from professional politicians. Mr. HOUK and Mr. EWART may be well assured, as Commissioner ROOSEVELT told them, that it is not the friends of reform who oppose the fullest investigation and the utmost publicity. The two gentlemen will find also that the testimony to the great benefit of the reformed system to the public service is not confined to Secretary WINDOM, but proceeds from superior officers in the service belonging to all parties. Misconduct and errors in all offices may undoubtedly be found; but that, of course, is not the object of Messrs. HOUK and EWART, who object to the principle of reformed administration.

THE CONGRESSIONAL ELECTION BILL.

THERE is evidently no haste upon the part of the majority in Congress to proceed to the passage of a law giving to the national government the supervision of Congressional elections in the States. This is a wise reluctance. Careful regard for traditions and long-established practices, and for the facts of the situation, is a cardinal element of wise statesmanship. Whatever a Constitutional power may be, the fact of its existence does not necessarily justify its exercise. There is no principle more fundamental in our political system than local self-government, and its disturbance and invasion under any plea are most hazardous to the general welfare. The consciousness of this local power is one of the chief moral bulwarks of the national union. The smallest State would regard the control of its Congressional elections by national officers with a jealousy not less than that of New York and Pennsylvania. Granting the Constitutional power, only the extremest exigency and the plainest proof that the extreme remedy would accomplish the result desired would authorize its use as the lesser evil.

We have recently stated the Republican view of the situation which the proposed election law is designed to affect. But we have seen no important Republican organ which ventures the declaration that the proposed law would really solve the difficulty. But if that effect is not reasonably clear as the necessary consequence of such a law, but improbable in the highest degree, the passage of the law would be a monstrous and mischievous error. The fact of the existence of a difficulty is not a valid reason for the adoption of any remedy for it that may be suggested. This is acknowledged in the case of prohibition. The immense majority of intelligent Americans concede the enormous evils of intemperance. But they do not therefore agree that a law to prevent intemperance by abolishing the sale of intoxicating liquors would be sensible or effective. They hold that under existing circumstances, as well as upon sound principles, it is better to regulate the sale, and to trust to moral influences and sanitary considerations. This is the result of the indispensable consideration of the actual conditions of an evil before proceeding to devise methods of relief. It is a principle which cannot be more imperative in any case than in that of the interference with the colored vote in the Southern States.

In full view of the situation in districts where that vote is suppressed, neither the proposed law nor any other could assure a free vote, because the causes that restrain the vote are not amenable to law. No man has expressed himself more strongly in favor of doing something, if anything could be done effectively, than President **Harrison** when he was a Senator. Yet he said at last, in the Senate four years ago, and his words may be accepted as those of the great intelligent body of the American people:

> "I have looked hopefully in the old times to the forcible intervention of the government in their defence. I have thought that it might be possible, under that stringent legislation which Congress adopted, by the forcible intervention of the Federal authority to protect them in those rights of which they were so cruelly deprived. But I have ceased to have faith in the possibility of that intervention in their behalf, constituted as this government is, with its complex organization of Federal and State governments, independent within certain limitations."

It must be remembered, moreover, as was distinctly shown in the case of the Force Bill of 1871, that there may be legislation to remedy acknowledged evils which will outrun public sympathy, and without moral support could have no practical effect whatever. That act, as **Alexander Johnston**, one of the wisest of our political students, too early lost, wisely and truly said, "went farther than the instincts of the American people would follow Congress." The proposed act would be of the same kind. It would be a *brutum fulmen*, which the most humane and patriotic sentiment of the country would deeply deplore.

THE FAIR.

Speaker Reed has appointed a special committee of nine upon the World's Fair which is universally satisfactory. Each of the contesting cities has two representatives upon the committee, and the chairman, Mr. **Candler**, of Massachusetts, is not a partisan of any of the contestants, and is a very acceptable chief. Mr. **Springer**, an ardent member from Illinois, is anxious to have the House proceed at once to ballot to determine the place where the Fair shall be held, and to continue balloting until a decision is reached.

This is the course that will be pursued ultimately, because the committee cannot be expected to report unanimously, and the House will have to choose between the reports. Mr. **Springer** says that many Democrats are opposed to holding any Fair except upon a guarantee that the national government shall not pay any bills. But unless in some way the Fair receives unequivocally the national sanction, and is in effect a national enterprise, it will be regarded as a private undertaking, of which foreign exhibitors will be very wary.

The New York Legislature has unanimously petitioned Congress that New York may be chosen as the site for the Fair, and the law which has been drafted by the Committee on Legislation has been approved, and will be introduced and undoubtedly passed by the Legislature. Mr. **Flower** and Mr. **Belden** are the New York members of the special committee of the House, and they will spare no effort to secure the prize for the city of New York. But we observe no indication in the reports from Washington of the real disposition of Congress. Such votes as have been taken show only great uncertainty. Yet probably the country would be exceedingly surprised if any other place than New York should be finally selected.

RAPID TRANSIT.

Rapid transit in New York is almost a national interest, so enormous is the constant arrival in the city of visitors from every part of the Union. Of course in a community so teeming with politics and jobbery, and permanently confronted with Tammany Hall, a scheme for the purpose which is "as clean as a hound's tooth" is very difficult to devise. But such a scheme, Senator **Fassett** assures us, is contained in the bill reported by him in the Senate of New York. The bill creates a commission of seven persons—the Mayor and six other citizens—and the names mentioned in the bill were received at once with general favor and pleasure as those of respected and trustworthy gentlemen. Their powers are large, but large powers of the kind may be always safely granted to such men.

They are to decide upon the necessity of rapid transit, select the routes, and determine the kind of transit. Fifth Avenue, Madison Avenue, Broadway below Thirty-third Street, Fourth Avenue above Forty-second, and the streets now occupied by elevated roads, are excluded from selection; but Broadway may be crossed, and a road beneath Broadway is not forbidden. The selection of the route—and this is a droll constitutional concession to a fiction of proper local government—must be approved by the Aldermen, and the consent of half the property owners upon the line must be secured, or the land condemned by a commission appointed by the Supreme Court. When this is all accomplished, the franchise must be sold at public auction, and the road is to be built and operated under the provisions of the act and the control of the Rapid Transit Commission.

By common consent this is an excellent scheme. It promises prompt relief where relief is required, and it brings intelligence, character, and ability to the solution of one of the perplexing problems of the city. It is, indeed, a pleasant reminder of the time when such qualities were thought desirable and even indispensable in all municipal administration. It is the first measure of importance introduced in the Legislature at this session, and it will be fortunate if it proves to be a precedent. If this Legislature should pass a wise ballot reform law, a good license law, and a rapid transit law like that of Mr. **Fassett**, and abstain from the old childish game of "putting a Governor in a hole," it would be gratefully remembered.

THE ADIRONDACK PARK.

Public interest in the case of the Adirondack region has received a fresh impulse from the Governor's message recommending the reservation of the portion owned by the State and under the supervision of the Forest Commission as a park. The duties of the Forest Commission are limited to the preservation of the woods, and the Governor therefore suggests a special commission to inquire into the expediency, practicability, and cost of such a park, perhaps fifty or seventy miles square. This tract should include the wilder portions and the head waters of the Hudson River.

The Governor remarks that the Adirondacks have become a great summer and winter resort for the whole country, and his recommendation is valuable as a sign of the thorough awakening of the State to the necessity of a supervision of the northern forests so comprehensive and thorough that the dangers of the long negligence by which the State has grievously suffered may be arrested. The agitation of this subject in the press has been most salutary, and the faithful and intelligent persistence in the good work of *Garden and Forest* has been of the greatest service.

This recommendation by the Governor, like that of the system of State roads in his annual message, will be greeted with a [illegible]! A reformed ballot law is quite as essential to the welfare of New York as an Adirondack Park, and a sound and effective license law would promote straight travel upon the State roads that the Governor proposes. It might be supposed that the satisfaction derived even from proposing a good thing might tempt a Governor to try the pleasure of doing good things. The renown that his administration would gain from an effective reformed ballot law would eclipse that obtained from a great Adirondack Park.

CASTELAR UPON PAN-AMERICA.

Castelar, the Spanish republican leader, has written a paper upon the Pan-American Congress which is in singular accord in its conclusions with the article of Mr **Albert G. Browne**, to which we recently referred. **Castelar** recognizes the fact that the Spanish American and the Anglo-Saxon American are not yet in accord, and therefore that an "inner and spiritual" unity is impossible. He holds that there is but one sort of analogy between the North Americans and the South Americans, and that is the more or less republican character of their institutions. Even in this, however, the divergence is greater than the resemblance. A North American republican is politically hardly at home in a South American republic.

But what chiefly strikes **Castelar** is the antagonism of interests between the two kinds of Americans. The United States are based upon a principle of internal centralization and external expansion. They close their frontiers to imports and open them to immigration. They could not be independent of foreign influence without excluding foreign imports, but proclaiming human rights they could not prohibit foreign immigration. This is rather a poetic way of putting it. But, on the other hand, he says, when the South American republics separated from Europe they welcomed universal industry, and opened trade with all the world. And then the poet asks the very practical question, "How can they be supposed to want that curious *Zollverein* which will compel them to buy dear American goods when they can get them cheap and in abundance from Europe?" A customs union he holds to be the only practical question for the congress. Señor **Castelar** regards Mr. **Blaine** as of a Utopian and dreamy mind, and really aiming at the rule of a single people over two hemispheres, a hope which in **Castelar's** judgment would be resisted by both North and South America. South America must be united at home, and to that point the republics are approaching. But in our country, he thinks, the delegates will find everything strange, and much from which they will shrink. These views are extremely interesting as those of the most famous living Spaniard.

PATIENCE.

The general discussion of the question of colored citizenship which has largely occupied the press in the absence of pending Congressional measures of importance, and the meeting of the colored National Convention, have resulted plainly in two conclusions: one, which we consider elsewhere, that national legislation in aid of colored citizens cannot effectively go farther; and the other, that some restriction of suffrage not based upon color might be a wise expedient for some of the Southern States. Universal suffrage exists in no State. In New York certain conditions of naturalization, sex, age, residence, and registration determine who shall vote. The restrictions exclude about four-fifths of the population, and are determined by expediency, not by principle.

If to these restrictions, which generally exist also in Southern States, some impartial and reasonable requirement of education and property were added, much of the apprehension which justly arises from an absolutely unenlightened vote, such as that which has to be considered in Brazil, would disappear. It would be at least an experiment worth considering. Undoubtedly it would be an experiment which it would be hard to persuade the present body of voters unanimously to adopt, and in any other States than those which are situated like some of the Southern States it would be impossible.

It may be impossible there. But the discussion will have the benefit of reminding us that it is not the ballot, but the intelligence to use it well, that secures good government. **Louis Napoleon** prated of the plébiscite and of his enormous support by the votes of Frenchmen. But those votes cost France a humiliating war and an enormous loss of prestige. It must not be forgotten, however, that the chief reason for giving the ballot to the freedmen after the war was that the white ballot was not friendly to their welfare, and it seemed the only feasible way to secure their rights. The situation, indeed, has changed, and the remark of Commissioner and ex-Governor **Thompson**, of South Carolina, that what is now wanted is patience is a very wise suggestion.

MEMORIAL TABLETS.

Mr. Edmund Gosse has undertaken to raise a little subscription to place a tablet or plate, suitably inscribed, upon the house in Warwick Street, London, in which **Browning** wrote some of his books. This is a beautiful and pious custom which is known in other countries more than in England. In Florence, a plate upon Casa Guidi states that there Mrs. **Browning** lived and wrote "Aurora Leigh" and "Casa Guidi Windows" and the *Sonnets from the Portuguese*. In Weimar, the houses of Goethe and Schiller are designated in the same way. It is not usual in European towns, and invests them with peculiar interest, which our own towns are beginning at least to share.

In Albany, crossing the park in front of the Academy toward the Capitol, the passenger will observe a modest tablet upon the sward at the intersection of paths—a memorial of noted events of which the park was the scene. Other places in the city of historical interest are, we believe, similarly commemorated, so that the past is made present to the consciousness of the wayfarer. So, in Concord, Massachusetts, a town peculiarly rich in historical associations, there are stones and tablets duly placed and inscribed, all of them, as in Albany, witnesses of that public spirit which makes the greatness of republics.

In this country, however, it is sites, rather than houses, which can be thus signalized. The houses in which **Bryant** and **Emerson** and **Longfellow** lived are not of durable material. Of the house in which **Bryant** was born only an excavation where the cellar was remains. **Irving's** Sunnyside, we believe, is built of stone. In any event, the spot remains, and its association with him may be recalled by a simple monument. Like the planting of a tree which presently becomes a choir for birds and a curtain of shade for the traveller, the erection of a simple memorial like that projected by Mr. **Gosse** will be a delight to thousands which otherwise they would not have known.

PERSONAL.

Colonel Ossian D. Ashley, president of the Wabash Railroad Company, is a gentleman of kind but commanding appearance, and, although his life has been full of work, at the age of sixty-seven years he preserves the spring and action of one much younger. He has always been a close student, political economy and French literature giving him pleasant recreation when not absorbed in his business, and even at the present time, while a portion of every month is taken up by trips to the West in the interest of his railroad, the evenings he spends at his home in Twenty-third Street are largely devoted to reading. Years ago, when Colonel **Ashley** was a stock-broker in Boston, he wrote some of the earliest financial articles that ever appeared in the papers of that city, and has since written frequently on business and other topics for New York journals. At one time he was captain of the old Boston Tigers, but gained the title of colonel from the Thirty-seventh Regiment of that city.

—**S. M. Minassian**, the head of the Armenian colony in New York, is a wealthy retired merchant. He gained his property by long and skilfully conducted business between this city and Constantinople, and was one of the first to introduce American products and inventions into the Orient.

—A familiar figure is now missed in St. Peter's at Rome, death having removed **Pietro Marcolini**, the only beggar to whom succeeding popes gave the privilege of pursuing his calling in the church. He accumulated a fortune of $10,000 during thirty years of begging.

—**Charles J. Clinch**, who will be benefited to the extent of about $2,600,000 by the recent settlement of the **Stewart** will contest, was formerly United States consul at Bordeaux.

—**Daniel Lovering, Jun.**, the Boston superintendent of the Adams Express Company, has used the corporation's wagons in the cause of humanity during the recent fires at the Hub, their voluntary aid in removing goods during the great conflagration of Thanksgiving Day being especially valued.

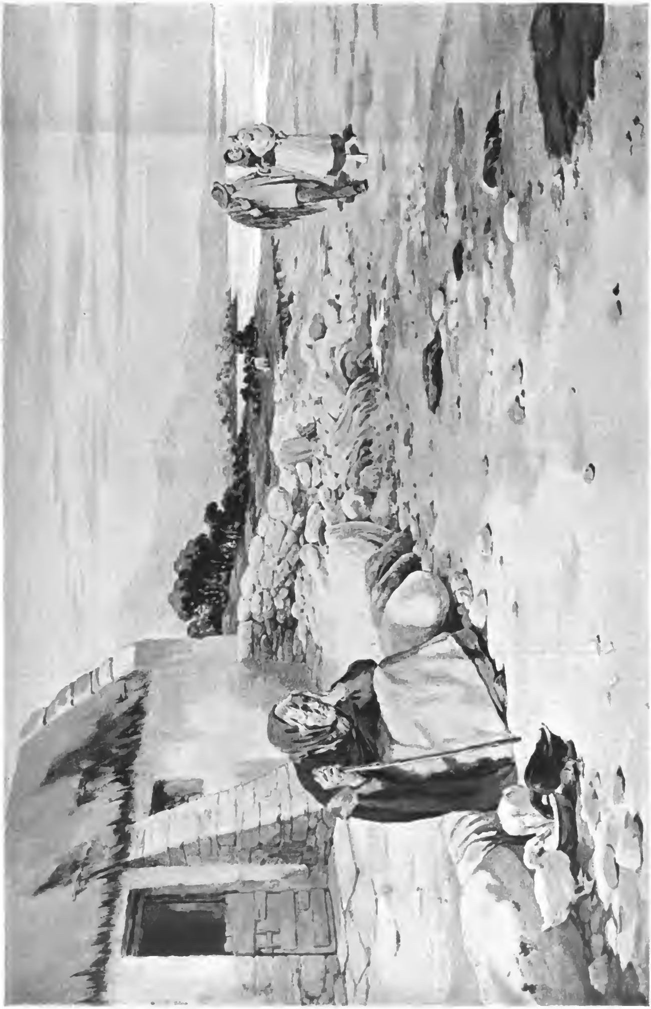
—An English nun, **Sister Rose Gertrude**, is now on her way to the Sandwich Islands to spend her life among the lepers of Molokai, Father **Damien's** former charge. Her real name is **Amy Fowler**.

—Vandals have girdled the **Grant** elm at Lexington, Massachusetts. It was planted by General **Grant** on April 19, 1875, the one-hundredth anniversary of the battle of Lexington.

—The Paris Communists were not at all chary in the selection of their officials during their brief lease of power, and **Victor Grelier**, a cook who had fallen so low that he was a menial in a public wash-house, became their Minister of Commerce. After law and order had been restored, **Grelier** won the hearts of his captors through their stomachs, and was made the *chef* of the governor to whose province he had been transported. Later, he was permitted to return to Paris, where he died the other day.

—**Clara Barton** is a fine shot with either a rifle or a shot-gun.

—Although over one hundred years old, Mrs. **Patty Blair**, of West Brookfield, Massachusetts, is as sprightly as a woman of seventy-five. She remembers well a visit of **Lafayette** to the town.



RECOLLECTION.—Drawn by Howard Helmick.—[See Page 82.]

those dark shadows, that my breath came irregularly and I heard a dismal ringing in my ears. Yet I had less to fear than either of the others who had crossed before me, for the ropes still were fast to the chain, and should I not swing far enough I would be helped to safety by my companions. But for shame, I should have made my body fast to the chain by a rope sling, and so have gone across as our stores had gone rather than as a man. But my pride forbade my surrender in this fashion to my fears; and it was a lucky thing for me that it did.

Holding the bar in my hands, I ran briskly across the ledge, and, with a strong kick on the edge of the cliff to give me additional impetus, I went spinning out into space. For an age, as it seemed to me, I sank rapidly; while that horrible feeling possessed me—the like of which people subject to sea-sickness feel as the ship drops away beneath them into the trough of the sea—of falling away from my own stomach. And then, just as my strength seemed to be failing and my hold on the bar loosing, I perceived that I was rising again; and this put a little fresh heart in me, and I tightened my grip on the bar. Ten seconds, no doubt, was the full extent of the time that my passage consumed; but it seemed to me then, and it seems to me still as I think of it, a long ten years. And a thrill of terror goes through me as I think, also, of how near I then came to a horrible death: for at the very moment that I reached the farther side of the cañon there was a little tinkling sound in the air above me, and the bar that I held was twitched out of my hands, and then came a loud jingling of metal on rock—and as I turned quickly I saw a gleam of sunlight catch the great chain as it went twisting downward into the black gulf below.

[TO BE CONTINUED.]

EVICTION IN NEW YORK.

No more affecting subject has ever been found by artist, orator, poet, or romance writer than eviction. The sorrows and sufferings of those who lose their homes have been used to sway Parliaments on questions of state, and have never failed to touch the sympathies of the tender-hearted, irrespective of any plea of justice or equity between landlord and tenant. Human nature cannot, unmoved, view such destitution as seems inseparably connected with the loss of shelter for women, children, and the household gods. Yet while this sentimental side of a controversy that must come up from time to time, as long as men dwell in hired houses, is indisputably the one that will first claim the attention of all humanity, there is another side that cannot be ignored.

So long as civilization admits the right of property in real estate, the law must protect that right, and the owner's claim to rent for the use of his property is as valid as his claim to any other of his possessions. He cannot be denied when he demands with perfect logic that he shall either have possession of his premises or receive pay for their use. Among the infinite complications in which this plain debtor and creditor question is involved by the necessities of the debtors, the legislators of modern times have floundered about with various and sometimes conflicting results. In New York, according to the popular notion at least, the laws favor the landlord rather than the tenant, and such cases of hardship as the artist has portrayed on another page are by no means so infrequent as could be desired.

This is perhaps because the statutes provide for what are known as summary proceedings, and these proceedings are so manifestly to the advantage of the landlord that the old-fashioned suit for ejectment, which sometimes dragged along for years, is hardly known any longer in New York courts. Under these statutes, if the tenant makes any default in the payment of his rent, or if he remains in possession of the hired premises after the expiration of the term for which he hired them, the landlord may go to the district court and make an affidavit, which being duly verified becomes a complaint. The law strictly prescribes that this affidavit shall clearly state all the material facts in the case. It must tell the relationship of landlord and tenant existing between the parties; the facts of the hiring of the premises; the amount of the rent payable; the specified terms, and manner and time of payment; the tenant's occupancy of the premises; the failure of payment at the specified time; the demand of the landlord for payment; the neglect of the tenant to pay; the demand of the landlord for possession of the premises; and the continued occupancy by the tenant.

On this affidavit the court will issue a "precept," requiring the tenant, in not less than three days (including the day of service and the day of return), to show cause why he should not surrender the premises. There can be no adjournment, excepting by the landlord's consent, beyond the day and hour specified in this "precept," unless the tenant raises an issue on some material allegation in the affidavit. The judge granting such an adjournment is guilty of a misdemeanor. If the tenant is in a position to deny some material statement, and get a lawyer to fight the case, he may get adjournments; but if he cannot, his only alternative is to pay the rent. If he cannot do that, no matter what his exigencies or misfortunes may be, no matter how certain he may be of his ability to pay even in an hour's time, the court must give judgment for the landlord. The law is inexorable.

Judgment being rendered, the court has a limited discretion only about issuing a warrant of eviction. If it be Saturday, no warrant is likely to be issued till the following Monday. If the tenant or any of his family be so sick that death is likely to be caused by removal, it is not probable that the judge will issue a warrant till that emergency is past. In default of either of these conditions, however, the court must, at the request of the landlord, enter the judgment and issue the warrant immediately. These warrants are usually addressed to the city marshals, and it is to be said to the credit of these officials that there has hardly ever been known a case in which they have discharged their unpleasant duties in any way but the kindest possible. It seems to be beyond the power of most civilized men to be harsh in the infliction of such a penalty as extreme poverty incurs in this case. Nevertheless, the marshal has no more discretion than the judge. If the landlord insist, he must remove all the furniture and belongings of the tenant as far as the public sidewalk, and eject all persons in possession, using any necessary force to accomplish this end. Then he locks or seals the premises, and delivers them over to the landlord. What happens thereafter to the tenant or to any of his belongings does not concern the judge, the marshal, or the landlord. The law has been complied with, and if no wilful damage has been done, there is no redress.

As in cases of hardship of almost all kinds, the poorest people suffer the most when they are victims of this process of eviction. A penniless woman, such as the artist has portrayed, if deprived of shelter, loses, by the one stroke of ill fortune, all that makes life sweet. Her little child, too small to be an aid in the labors of life, must be "put away" in the care of some benevolent society, of whose benevolence it can too often be said that it is like the "tender mercies of the wicked." The babe at her breast is even a greater hinderance to any effort she might make to sustain herself in the fierce competition of wage-earning. It too must be surrendered, and the despairing mother can have little hope that it will ever know her again. The few poor sticks of furniture that were of too little value to be sold or pawned are set upon the sidewalk, where she can neither use them nor hope to keep them.

Life has suddenly resolved itself to a bare struggle for food, with all the odds against her, and her only resource is in the charity of the public. This, it must be said, is a far better resource than may be imagined. Among all the wickedness of Gotham, carelessness of the sufferings of others is not to be reckoned. I have known very many instances of dire poverty in a long experience of newspaper life, but I have yet to find one that will not be promptly and liberally relieved if brought to the public notice. The only hinderance to the exercise of the almost boundless charity of the citizens of New York is ignorance. Too often the sufferers do not know how to appeal. Too often the charitably disposed fail to learn of such cases as the one in the picture.

WINTER DAWN.

A mystical silence weird and gray
  Rests like a dream on the garden white;
The darkness fitfully steals away
  Like a sullen raven before the light.

The naked wood in its winter sleep
  Is songless and still in the bitter air;
No birds in the flowerless meadow cheep
  Where timidly lopes the wary hare.

All tremulous in the distance far
  A ribbon of rose begins to shine,
Where a beautiful luminous lily star
  Softly dissolves in the airy wine.

R. K. Munkittrick.

RECOLLECTIONS.

Mr. Helmick is supremely true to nature in his sketch. There is a rugged lonely look about the bleak rocky coast which communicates a chill, and suggests the thought of the barrenness of a life spent among such cheerless surroundings. The "old, old story," however, repeats itself here, coming in to brighten up the scene. It gives a tinge of romance not only to the homely bent figure of the old crone, whose days have been spent in hardship and poverty from youth to old age, but also to the forms of the young parents, who seem oblivious of everything but the child in the young mother's arms.

How the thoughts of the old mother go backward as her eyes rest occasionally on the stalwart form of her fisherman son returning to his "cottage," with his "seine" thrown over his shoulder, apparently as happy in the possession of wife and baby as if toil were unknown or unnecessary! The poor old creature thinks of the time when she tripped blithely out to meet her "good man" returning from some fishing expedition, carrying her baby just as proudly as her daughter-in-law in the picture now bears that baby's son in her willing arms. As these bygone days revert to her mind, her heart is doubtless just as much bowed down by the memory of the father of her boy, who one grievous day went on some excursion to the fishing grounds never to return, as her old body is in the picture before us. Her thoughts are full of the days of her youth, when sorrow and death were unknown; when she was a fair young "colleen," sought after by the country lads for miles around; her name quoted as the best dancer in the parish; her bonny face present at every scene of jollity and frolic; her laugh the merriest, as her heart and feet were the lightest. Ah! poor old soul, can we not all feel when looking at her what the "recollections" are which fill her mind, and agree with Tennyson that

> "A sorrow's crown of sorrow
> Is remembering happier things?"

She probably feels that now she is of no account to any one. Her son, of course, as in duty bound, gives her a shelter, a crust, and a seat in the chimney-corner, but if her place were vacant on the morrow, who would miss her? Truly, as "the days of our lives are threescore years and ten," but after that "they bring but trouble and sorrow," so with our old "type of the past" in this sketch; and yet so closely is the heart of the Irish peasant knit to the native soil, that this principal figure of the picture would not, in all probability, take in exchange for the wretched hovel in which her rude life has been passed, the finest home if it were far removed from the scene before us. There is scarcely a rock or tree on which her gaze rests which has not to her some hallowed association, some memory set apart.

HALT OF A SIBERIAN CONVOY.

Thanks to the present popularity of Russian literature, and to a wide-spread interest in the institutions of that great empire, we are in a fair way to know almost as much about Russians as they know about themselves. But it is extremely difficult for any writer to convey a just notion of the characteristics of Russians; and, indeed, the task becomes almost impossible if he fails to insist on the race peculiarities, which indelibly color every motive and every action. Seen through the glasses of western civilization, the customs, habits, morality of the Russians are so little in harmony with our own traditions and present usages that we are disposed to indulge in severe criticism, without pausing to consider the surroundings and circumstances which make these elements of civilization seem to us peculiar and incomprehensible.

The Chinese, filled with pride of their own nationality, and unable, from their isolation and from the strength of their race traditions, to conceive of anything equal to their own civilization, honestly consider the outside world barbaric. In this respect we of the Western world are much more Chinese than the Russians, for they, probably more than any other nation, are the most eager to assimilate modern ideas and adopt modern customs. I am aware that this statement needs some explanation; still, if we look at the wonderful strides toward the highest forms of civilization made in the last half-century through every part of that immense empire, we must recognize the fact that there is nothing like it in the history of nations. The soil in which the seeds of modern progress have been so effectively sown was none of the most fertile, and even to-day presents, to the outsider at least, few or no attractions for labor in this direction. The Egyptian darkness of ignorance, superstition, and Oriental barbarism which shrouded the people is not yet by any means dispelled, nor have the brilliant rays of nineteenth-century civilization penetrated all the angles and corners of the labyrinth. The penumbra of the shadow of past ages still covers the great mass of the people, and generations must yet pass away before they cease to feel the burden of their inheritance. Tourguénief, in his *Souvenirs of Bielinsky*, says of the state of society only a few decades ago: "When one looked around him he saw venality in full vogue, serfdom crushing down the people like a rock, military barracks springing up on all sides. There was no justice; they talked of closing the universities; foreign travel was not permitted. A sombre cloud hung over what was then called the Administration of Letters and Sciences. Denunciation crept in on all sides; even between young people there was no common bond, no generous interests. Fear and adulation were everywhere." From the accession of Alexander II and the liberation of the twenty-four millions of serfs in 1861 dates the great modernization of the empire. Assuredly the record of progress is scarcely paralleled in history.

We are accustomed to criticise the faults of the Russians as if they were greater faults than our own, forgetting that they are different, but not on that account greater ones. These faults become perfectly comprehensible to us, and we more readily condone them, if we succeed in tracing them to their origin, in locating them in their surroundings. A quarter of a century ago Russian barbarism, if we had known it as we know it now, would have filled us with disgust; but at that very period there were being perpetrated within our own borders atrocities beside which Siberian tortures are child's play. Circumstances obliged us to overlook these crimes; so in Russia circumstances may palliate many public acts which at first sight would seem inexcusable.

The Siberian system is the most prominent blot on the institutions of the empire. It is more dramatic in aspect, and appeals more forcibly to our sentiments, than any other. The scope of this brief article necessarily excludes any discussion of the wrongs or the merits of this system, or any attempt to add a word to the volumes of descriptions and arguments which have been written on the subject. The reading class in Russia is perfectly acquainted with the workings of the system, and intimate knowledge of it is not confined to those alone who can read. It is for the most part accepted by the people as a necessity of government, in the same way that flogging is considered a necessity of military discipline. That the government does not choose to hide the evils of the system from the people, even the lowest of them, is abundantly proven by the presence in the Imperial Gallery in Moscow of a large picture representing a march of convicts, an engraving of which is published in the present number of this paper. The drama is introduced with such vividness and such realism that no description need accompany the engraving. The little scene enacted in the foreground is more eloquent than a printed page, more suggestive and impressive than the language of the most skilful speaker. Its accuracy can scarcely be questioned, and it carries to the spectator a realization of the horrors of the convict system in a way that the lowest intellect can comprehend. Why, then, is this picture permitted to hang in the Moscow gallery, unless it be a part of the great general endeavor to elevate, educate, and civilize the people?

It is the commonest trait of the Russians that they are perfectly frank about themselves as a nation. They often declare that they are divided into only two classes, those who use Lubin's soap and those who use no soap at all. In general terms this is true, for the middle class is so numerically small that it may be practically counted out. Yet the development of a middle class is a necessity of progress, and another generation will see this class much greater and more useful. Russians do not scruple to say that their country is largely in a state of semi-barbarism; and the men of culture and refinement who tell you this will at the same instant invariably betray, by word or gesture, the taint of Oriental indifference and fatalism which characterizes Russians of every rank, and makes barbarism a possibility among them.

Tolstoi often alludes in his writings to this frankness to confess shortcomings and faults, and in his inimitable way shows how little service to them is the contemplation of their own inner selves. Introspection with them does not serve to stimulate their conscience, but rather to throw the glamour of fatalism over it, and to make this an excuse and a palliation for every weakness. It is this element of Russian character that makes them difficult to deal with in matters of reform. If their attention is called to gross injustice or criminal negligence, they will at first show an honest sympathy and interest, but will soon throw off all responsibility and satisfy their consciences with the remark, "We are a race of barbarians," or by that commonest word, "directly," representing the commonest fault among Russians—procrastination.

It was my fortune to be intimately associated with the Russians at a time when they were more before the eyes of the rest of the world than they have been for a long time—namely, during the Russo-Turkish campaign. The apparent indifference to the sufferings of their own people; their exuberant sympathy with the misfortunes of the Turks; their patience under hardships and difficulties, most of which resulted from their own neglect and procrastination; their admiration for truth, and their own lack of this virtue—these are but few of the anomalies of character which were exceedingly difficult to reconcile. I have seen the Emperor shed tears over the wounded men of the Imperial Guard, and a few days later the same unfortunates were dying by the hundreds on the road to the hospitals through criminal neglect and ignorance. It was a common sight after a battle to see officers throw money to wounded Turks and pass by their own men with only one word of pity. When Plevna fell, thirty thousand Turks were herded together for days without shelter on an open plain in a heavy snow-storm. In the Balkan campaign the highways from the mountains to the Danube were black with trains of springless carts transporting Russian wounded for many days, without shelter from the wintry storms, and without any adequately organized commissariat or medical service. The exercise of ordinary forethought and the observance of the commonest laws of humanity would have saved thousands of lives and millions of treasure. But the habit of procrastination and the taint of fatalism were too strong in them to be overcome even by questions of life and death, and they went on to the close of the war in much the same way as they began.

An incident, though of little importance in itself, will, nevertheless, show how the Russians regarded the situation at the time. At the fall of Plevna I sent, in my capacity as correspondent of the London *Daily News*, a long despatch describing the horrors of the town after the surrender, and supplemented this with sketches to the London *Graphic*, not sparing the Russians at all in my criticisms of their treatment of the Turks. After a few days I returned to the Army of the Balkans, which I had left temporarily, and awaited with some misgivings the arrival of the courier with St. Petersburg newspapers, which I knew would contain translations of my despatches. One morning General Gourko sent for me to come and see him. I knew the post had arrived, and presented myself with the full conviction that he would announce that it was his unpleasant duty to send me away from the army. To my great surprise he advanced and shook hands, and congratulated me on the realistic way I had described the horrors of Plevna and the accuracy and justice of my criticisms. "You have told the exact truth," he said, "and we Russians are only too anxious to have the truth about us published to the world. As long as you are with me, please remember that you are at perfect liberty to write the truth about us. This Plevna business is most terrible, most deplorable." "But, general," I said, "you seem to realize the state of things as much as any one; indeed, all the officers with whom I talk continually and vehemently deplore the barbarities that we daily witness. Why don't you, why doesn't the commander-in-chief, report these things?"

"God knows!" and a shrug of the shoulders was all the answer I could get out of him.

F. D. Millet.

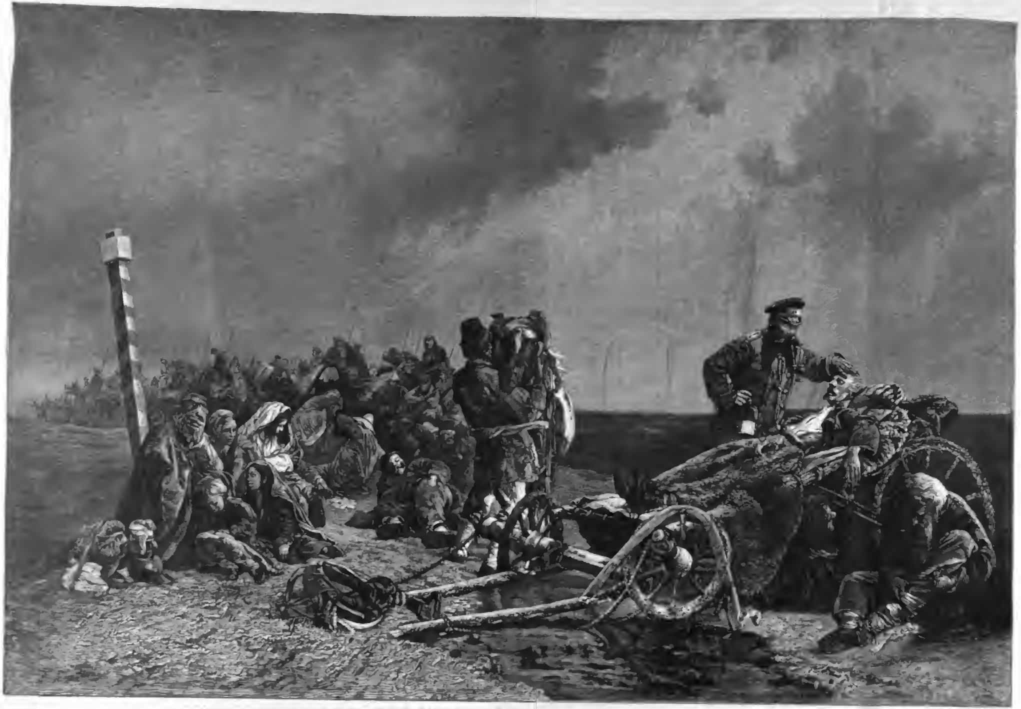
A DESERTED FARM.

I pass the burrow of the shy field-mouse,
  Pink broom-sedge, and pale hints of aftermath,
And near the mouldering doorway of a house
  Long threads of treacherous silver bar the path.

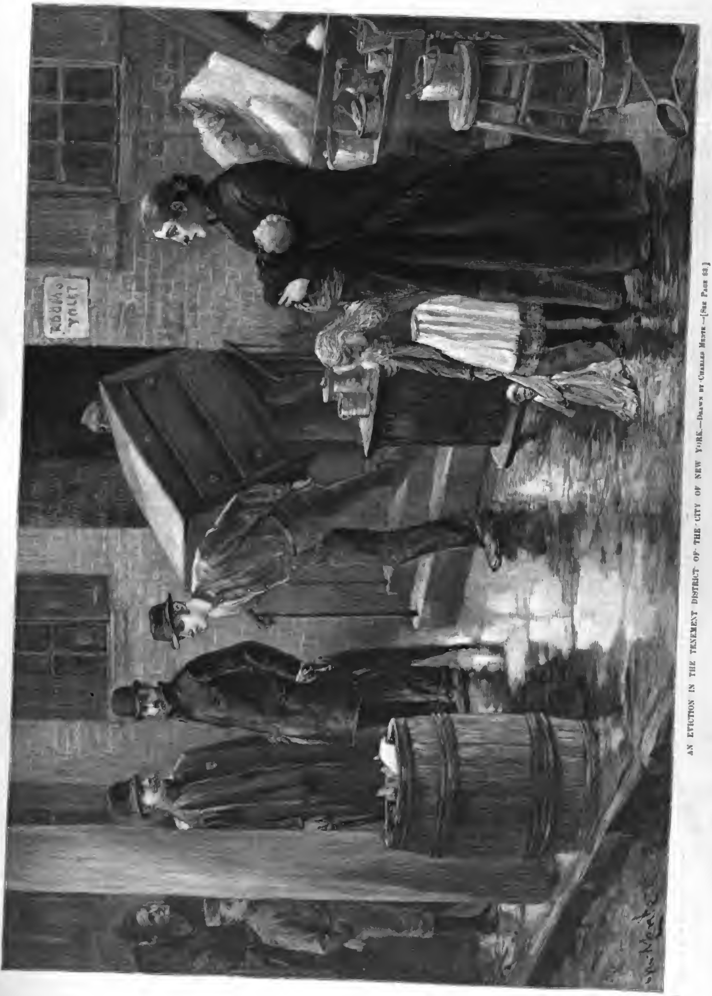
Across the threshold, whence all life has gone,
  The forest weavers deeper webs have spun,
That lift their silken meshes to the morn,
  Or snare the bloom of the evening sun.

With autumn silence brooding over all,
  It seems as if such Chinese nets at last
Had captured and imprisoned past recall
  The harvest sounds and melodies of the past.

William H. Hayne.



A HALT OF EXILES.—From the Painting by Valerian Ivanovitch Jacoby (1861) in the Tretiakoff Collection, Moscow.—[See Page 83.]



AN EVICTION IN THE TENEMENT DISTRICT OF THE CITY OF NEW YORK.—Drawn by Charles Mente.—[See Page 82.]

A SIX-FATHOM CANOE.

A SIX-FATHOM canoe is one of the most formidable products of savage man. As its name indicates, it is thirty-six feet long, and though built of no stronger material than the smallest birch-bark vessels—and like them having its seams pitched to make them water-tight—it will carry three tons and a dozen men. In Canada the capacity of a canoe is always estimated at half a ton to the fathom, or, as the Indians and traders would say, at ten bags to the fathom. A bag is the measure of a hundred pounds, and the term is used because of the ancient custom, still pursued, of packing all goods that can be so divided into parcels of one hundred pounds each. This is done that the Indians may readily pack the cargoes on their backs when they come to shallow, unnavigable pieces of water, or are obliged to transport their boats overland from one water system to another. Our hunters call such interruptions "carries"; but the French explorers and early rulers of Canada impressed their language upon that country, and a carry is there called a "portage."

In the scenes that Mr. Frederic Remington has sketched for another page of the WEEKLY the process of portaging a boat's cargo is shown. Those types of men he has drawn show the Indian almost in his purity, and the half-breed, having a strong admixture of French with Indian blood. The men, the camp, the water-side settlement, are all features of the Hudson's Bay Company's territory. The vast business of this great trading company is transacted by canoes in most months of the year, and when winter locks up the waters, sleds and toboggans drawn by horses or dogs take the place of the canoes. These winter vehicles still follow the steamers, and traverse the level surface of the lakes to a greater or less extent. In the spring the winter's harvest of furs comes down to the main collecting posts in these canoes, and in the summer the provisions and merchandise for barter are distributed all over British America from these centres in the same way.

The roads of that great northern territory are the waterways, and the vehicles are these boats. The waterways of Canada form a wondrous series of systems of communication. The finer the map of Canada, the more water it is shown to possess. It is like a great sponge, filled and dripping. A vast amount of this water is thrown into Hudson's Bay, but the southern incline of land supplies our great lakes, and, in turn, the St. Lawrence, Ottawa, Red River of the North, the two great Saskatchewans, and many smaller streams. With more or less portaging, a canoe can start from Ottawa and go to Labrador or to Hudson's Bay, and thus to the arctic circle. The western half of British America is equally well commanded from Winnipeg.

FRENCH GAS.

IT was on the seventh landing, half-way up the fourth flight, that I met the faithful Sally, with her expression at half-mast, and a dangerous-looking document in her hand. Our Sally was the tyrant of the cosy little apartment in the Faubourg St. Germain, and played in addition the dual rôle of nurse-maid *chef*.

"I cannot think what it is," said she, rolling her eyes mysteriously. "It was a kind of a soldier that brought it, and he was pretty stiff about it, too. And so," she continued, "I've just busied myself packing up a bit."

"Packing up," I groaned, "and we paid our three months' rent in advance but yesterday! Why, what are you thinking of?"

"I'm thinkin'," said she, turning red at the idea of being questioned, "that it wasn't for nothin' thim Frinch frogs was singin' an' jumpin' Boulanger in the streets all last night." By this time we were in the parlor and she had closed the door. "I'm thinkin'," she went on, solemnly holding up the document, "that thim Germans have declared a war, and we've a right to go home. God knows I want no foreigner givin' me the last sacramint in Frinch!"

Sally's lip quivered; she fell into the best chair, fanning herself with her apron. She realized there was no time for etiquette in the hour of death.

It was a long document. From the beginning to the argument proper was about twenty-five centimetres—a little more than a quarter of a yard of "whereas, wherefore, in the name of the French Republic, . . . liberty, equality, and fraternity. . . . the august municipal government of Paris, . . . the government officers of the Eighth Ward, . . . the sacred provisions of French law, etc." In short, if I wanted gas in the house, I would please comply with the formalities prescribed by law.

Sally went out to broil the beefsteak, while I made an unsuccessful attempt to drown my excitement in a French newspaper without any news in it.

In France there is much that is controlled by law. Among other things the government is gas, and gas is the government. A month before our war excitement a slippery, smiling landlord had called to say that the apartment-house in which we lived had changed hands, and he had become the owner. A noble old gray stone structure was the house, with solid oak stairs that were the pride of my heart.

"True, the building is over a hundred years old," said the new landlord; "but as it stands it will outlast two new ones. We no longer build good houses; we modern Frenchmen are too hurried, above all in Paris, where everything is done with a rush."

I looked at him with interest.

"*I* shouldn't say a word. I am an enterprising young chap myself," he continued, smoothing down his *embonpoint*, the result of over half a century of French cooking. "Now, although mamma considers it a dangerous risk, for once I am going against her advice. I want to do something for my tenants, and I am going to put gas into the house."

When he left I gave him a good American hand-shake. Sally and I were delighted. No more spots of glimmer in oceans of gloom. No more Rembrandt dish-washing—one-half the plate in light, the other in blackest shade. No more candle grease on the furniture. No more struggles with those wound-up French lamps that are useless unless you can afford to keep a clock-maker. No more sitting down to read or write like an Irish corpse,

> "With a dozen o' candles around his head."

"By next week at the latest," said I to Sally, "we shall have gas."

During the next week our anxious lookout discovered no signs of the promised luxury. The week following we saw two workmen talking in an airy French way with two others. Toward the end of the following week it resulted in an amicable breakfast on our sidewalk. After that it went on swimmingly—according to the French standard. In less than a month there were breaks in the sidewalk; at the end of six weeks we entered the court by means of a plank that bridged a chasm four feet deep. As time rolled on, and we had by force of habit almost become attached to candle-light, we had a message: rich centenarian smells, born of the garlic of dead empires, rose up from the cellar to tell us that something was going to happen soon. It happened.

Again the faithful Sally met me on the stairs, this time all in smiles and her best embroidered apron. "It's General Boulanger," said she. "He's been waiting half an hour; but it's all right; he seems interested in the pictures and things."

"You're mad," I gasped. "What are you talking about?"

"He's come because we're neighbors and Americans, of course," she went on. "Heaven be praised! for if there's a war he'll look after us himself, and see that we get home all right."

The Frenchman who rose to meet me, with his pointed beard, cocked hat, frock-coat, gold stripes, and brass buttons, did not look unlike Boulanger.

"My dear madame," said he, with one hand on his heart, very like an imitation Frenchman in an American play, "I have called to see you on behalf of the city of Paris, to attend to the municipal regulations in connection with the city's Mutual Parisian Company of Heating and Illuminating by Gas."

"Oh!" said I, innocently. "Well, just make out the receipt, and I will pay the deposit. You cannot have the gas put in too soon to please me."

He removed the books and bric-à-brac from the centre table, putting the articles carefully on the floor, one by one. Then he laid his cocked hat on a chair, and opening a portfolio of documents, spread them all over the large round table.

"It is not so easy, madame," he answered.

He was right; it was not easy. I came to this conclusion when he went away, papers and all, about nightfall. In addition to a deliberately written chapter concerning my plain, uneventful career set down in a ledger, Sally's General Boulanger carried away three documents, promising to decorate them with the state seal, and return them to be signed in a new place. The first was an elaborate description of our family tree, no detail so small as to be unwelcome; the second was devoted to personalities concerning myself—my motives in living in Paris, or living at all, future intentions, assets, liabilities, and political views; the third was a solemn promise on my part not in any way to maltreat or abuse the Mutual Parisian Company of Heating and Illuminating by Gas, nor to break or steal its possessions, such as meters, lead pipe, and iron gratings. Moreover, I had personally to write down in a book that gas was wanted, and that I, no other, desired this particular gas.

A few days later I thought the Chamber of Deputies had strayed from their quarters when Sally ushered in five large, round Frenchmen in heavy overcoats and high silk hats. They were the landlord, his secretary, an architect, a builder, and a representative of the Mutual Parisian Company of Heating, etc. Such a powwow at once began as would pale a ward primary. The upshot of it was: "Where would I have the gas jets?"

"Centre lights in the parlor and dining-room," said I, "and side lights in the other rooms."

A roar went up like the board of brokers in harvest-time; they shook their fists in each other's faces and shook their canes at me. Then they held each other down and argued with me, one at a time.

I was "so small, so inexperienced; nothing but a poor little foreigner!"

"Did I know that gas was a very dangerous thing?"

"Did I realize that if I slept in a room where there was a gas jet not one of them would be responsible for my health?"

"But, gentlemen," I ventured to remark, "in America we have gas in all the bedrooms."

"Impossible!" thundered the five. "Contrary to all law." "It would be dangerous to children." "Frightful catastrophes would result." "Why, in America, of New York, we are told, they have not even enough of gas to properly light the streets!"

Overwhelmed for a time, I feebly wondered if we did have gas in all the bedrooms. The big five, outwardly polite, but inwardly convinced that I had tried to deceive them, squeezed single file through the little doors of all my small rooms, tapping walls, measuring spaces, and talking against time. They finally consented to one gas jet in the dining-room, one in the hall, and in the kitchen two—one each for illuminating and cooking. Sally soon learned to say "gaws" or "gozz," her equivalent for *le gaz*, and the word, however uttered, became the household synonym for interminable.

French law provides that gas-pipe shall be laid on the outside of walls, even if they are frescoed by Bouguereau himself. And to discourage suicide, every room where gas is burned must have a grating about six by twelve inches connecting with the hall, and the hall must have a grating connecting with the outer air. Sometimes Sally used to laugh until she cried, and stand wiping the tears away with her apron, while she watched the workmen. A couple of masons would come and dig a hole in the wall. In a few days a carpenter would come and put a casing around it. Later on another kind of a workman would come and set an iron grating in it. By-and-by a plumber would amble in, and with the help of two or three assistants would run some iron pipe along the wall. Sometimes a paper-hanger would come twice or three times with samples; ultimately, with the idea of concealing the gas-pipe, he would paste over it some strips of wall-paper that did *not* match. One room being thus well begun, they would go on with the next one. The masons would dig another hole, and the programme would be repeated.

The big five dropped in often to cheer the work along and admire its progress. Toward the end I could see they felt worried about leaving a family of helpless foreigners alone with the gas; and finally they sent a nice old gentleman to give me gas lessons. He taught me how to light the gas with the aid of a match, and how to turn it off. I was obliged to solemnly repeat the formula after him, and prove my proficiency by going through the motions. He instructed me, moreover, as to the danger of blowing out the gas, pointing his carefully worded phrases by a most ominous and terrifying pantomime. At the close of his lessons he gave me a key to a lock-box in the main hall, and charged me thirty cents for a kind of a French monkey-wrench. In case of fire, I was not to think of saving my family, myself, or my valuables until I had opened the lock-box, and with the aid of the monkey-wrench turned off the gas from our apartment.

We will pass over the return of Sally's General Boulanger with a bill of seven dollars and twenty cents for the government stamps that went on the documents already described, a tax that made me thoroughly appreciate the people who once made tea in Boston Harbor. There was, as a matter of course, a deposit of six dollars, to guarantee the gas bills; but it is needless as well as painful to dwell upon another man in brass buttons who got three dollars for installing the meter, or still another, with gold braid on his sleeves, who collected thirty cents a month each for the care of the gas-burners. The banker and the family doctor assured us that all these things were legitimate and customary, and all I could do was to lie awake nights and assure myself we would enjoy that gas enough to make it pay.

We had only been trying to enjoy the gas for a few weeks when there was a murder epidemic in Paris. It culminated in a horrible affair; the inhabitants of a small apartment were murdered in their beds—servant, child, and all. The *Herald* and *Galignani* warned Americans not to admit to their homes any men who did not come on authentic and well-understood business. One day I was invited to the American quarter for a noonday breakfast. "It may be late in the afternoon before I return," said I to Sally; "and now, above all things, be very careful whom you let into the flat when you are alone with the child."

"You know you can depend on me," she answered, with an expression like Joan of Arc at the stake. It was easy to see she did not like to be left alone, but was nerving herself for the worst.

As usual, I waited in vain for an omnibus that afternoon, and came home in one of those little victorias that cost thirty-five cents a trip in Paris. When a block away from the house I observed there was an unusual excitement in our street. I looked up to see if I could catch a glimpse of the child. High up, hanging out of my bedroom window, was a crazy Frenchman, yelling at the top of his lungs. It seemed to me I was years paying the cabby and climbing the stairs.

When I arrived at our landing the trial was just beginning, and I had only to join the crowd. One gendarme, whose sword clanked against the oaken balustrade, had my fainting Sally by the arm. The *concierge*, his wife, and all the neighbors chattered in concert. There were the butler from the Ministry of War, the two gendarmes who were arresting Sally, the man and his wife who kept a *crèmerie* hard by, a footman from the Spanish ambassador's, two *pioupious*, or common soldiers, an aged maiden lady of rank who was having hysterics in the arms of her maid, and several little errand-boys in blouses.

A perspiring, dishevelled Frenchman mopped his brow and pointed at Sally. "This woman," said he, "is a murderess. She locked me in a room, and had I not summoned assistance would undoubtedly have assassinated me."

"You are our prisoner," said the two gendarmes to Sally, who was luckily none the wiser for what they said, but went ahead with her explanation.

"The murdering villain come in an' pertended to be a gas-man come to take the meter, whin sure I'd a right to know him for a thafe whin the rale gas-man had just left from takin' the meter and puttin' that same in the book. 'Gaws,' ses he to me in Frinch. 'Yo can't come in,' says I. An' whin he paid no attintion to what I said, but walked by me into your room, I knew him for a murtherer, an' I turned the kay on him like a cat. 'Aha!' says I, 'ye'll find the gas-book an' the jewels in the desk, but it isn't far ye'll go with 'em.' An' thin, the child bein' aslape, I laid her in my room and locked her in, bless her heart! an' thin I called out the parlor windy for the police."

The gendarmes, consulting each other—they always travel in pairs in France—adjusted their swords and capes, preparing to move on with Sally.

"Who are you?" I asked the alleged murderer.

"Madame, I am an official of the municipality. I represent the Mutual Parisian Company of Heating and Illuminating by Gas, and I demand justice."

"But a gas-man had just been here and made an entry in our book."

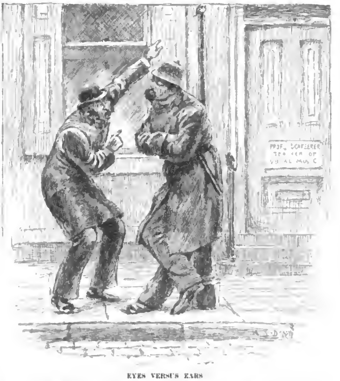
"Madame, it is my place to follow him, and see that no falsification takes place."

Slowly and unobtrusively I slipped a four-dollar gold piece into each policeman's hand; slowly and unobtrusively they relaxed their hold on Sally.

"This poor girl," said I, "ignorant of your language, has made a dreadful mistake. But she is an American, she loves France, and I promise you it shall not happen again."

"He looks the cutthroat he is," said Sally; "just a fit one to live in this hathen country. Small loss whin they cut his head off with the Frinch machine."

"What does she say?" asked the gas-man.



EYES VERSUS EARS

VERY EXCITED GENTLEMAN. "Hey! here! Officer, where are your ears? Don't you hear those awful screams? Some one is being murdered."

OFFICER. "Ears, eh? Where's your eyes? Don't you see the plate on the door?"

It was four silver dollars this time, and he hollowed his capacious palm to receive them.

"She says," I replied, "that she made a very absurd mistake to suspect a man of your appearance, and she most humbly begs your pardon."

The representative of the Mutual Parisian Company of Heating and Illuminating by Gas bowed and smiled. I took the hint. Sally and I slipped into the flat, and closed the door. In spite of all, the child still slept. The crowd dispersed, and we heard the last footsteps down the stair. It was growing dark.

"Sally," said I, "this entertainment is worth twelve dollars the first time, but I should not care to go again. Bring me the key and the French monkey-wrench," I continued, "and light all the candles."

With the key, the monkey-wrench, and a candle, I stepped firmly out into the deserted hall. And then and there I turned that French gas off forever. MINNIE BUCHANAN GOODMAN.

THE CHENEYS' VILLAGE AT SOUTH MANCHESTER, CONNECTICUT.

MR. EDWARD ATKINSON has shown most graphically that poverty does not keep step with progress; that it neither is its companion nor its offspring: that from progress, on the contrary, has resulted a better state of things for the wage-earners. The wage-earners in the cotton-sheeting industry, if they were paid in what they produce, would receive more than twice as much as they did in 1840. In that year the wages paid to each hand were equivalent to 1936 yards; in 1885 the men's wages were equivalent to 4154 yards. This was an advance of 114 per cent.; but the increase in efficiency of labor was 208 per cent.; the increase in the value of product was 122 per cent., while the increase of wages per hour, in money, was 89 per cent. The decrease in the price of the product was 28 per cent. These statistics declare the truth of what I have been saying: labor is absolutely better off than it was; and yet there continue to be almost innumerable pegs on which to hang controversy between employer and employed.

The same statistics tell so many different tales, singing to one man the fatal delusions of hope, and crooning to another of enormous disaster, that they are the most unsatisfactory basis for the student of economics, unless he is in a position to be untouched by their meaning. When they are resorted to by the one side and the other in the controversy between capital and labor, they are the endless source of bitter quarrelling. Perhaps the most potent evil engendered by the wage system, that which is most disruptive of the peace of the community, is the mass of statistics in which both sides have sought to measure the forces and elements which go to production. It is not always true that figures do not lie; and in order that they may not be distorted into a lie they must be interpreted with the utmost impartiality. From their very nature, in order to tell the truth at all, they must tell the whole truth. Nothing is so deceptive as distorted light, which is only another name for half-revealed facts. Ingenious partisans can do what they will with figures, and so long as we may oppose percentages of increase and decrease with absolute amounts, there will always be room for a dispute between those who pay and those who receive wages. The capitalists who engage in a joint enterprise have a simple problem. They buy their labor and materials in the cheapest market, and sell their products in the dearest, and the division of the result among them is a matter of elementary arithmetic. But when you come to measure human relations in numerals, your yardstick is so inadequate that it obeys the desires of any manipulator. Impartial measurers may catch a glimmer of the truth, but thus far they have had very little influence in the controversy. There are signs that they are to have more in the future. But whatever they see, and whatever they discover, there will always be discontent among men who are dependent on others for the means of subsistence.

The lesson that the history of the wage system teaches to the impartial observer, the man whose vision is clear enough to see that the condition of the working-man has improved, is that the new elements of production are coming nearer together; that the employed is pursuing the employer with a very swift and a very sure foot. Above all things, it is to be borne in mind that all readjustment of relations on an arithmetical or economical basis will be merely temporary and tentative. Changes in the system of taxation, increase of wages, decrease of hours, abolition of tariff charges, improved dwellings, and all that, are steps in the great advance, but they must leave behind the cause of the controversy, for it is impossible for man to resist his native impulse to struggle against all human mastership.

The best that is done for the working-man is by way of mitigating their conditions of life, and this is done either from motives of philanthropy or from a wise recognition of what may be called a business principle—that it is better for both capital and labor when the two are on friendly terms. A good many experiments have been tried, looking to the improvement of the working-man. The truth is, however, that working men and women much prefer to work out their own improvement, and are very strongly inclined to resent the restraints and restrictions of philanthropy. Moreover, philanthropy often fails of its end, and does positive injury, by making its moral standard the measure of a working-man's industrial value. "If you don't go to my Sunday services or avail yourself of the privileges of my library and reading-room, if you stay away from my course of lectures, where you may hear the most moral humorists of the country, you shall not be regarded with favor in my mill," is too often the impression which is given by some well-intentioned persons to those whom they seek to benefit. This is doubly unfortunate, because it involves a misunderstanding and inappreciation of good motives. Whether they are right or wrong, a good many people resent the patronage that is involved in philanthropy, and a very large number of persons who earn their living prefer to order their own lives. It is not my purpose, however, to illustrate the truth of what I have been saying generally concerning the relations of capital and labor by reference to misdirected efforts of any kind. A variety of methods have been tried by business men, governed wholly by business principles, not primarily for the ameliorating the condition of the wage-earners, but for promoting contentment, as a security against strikes and other hostile labor movements, and for making life in a mill village as pleasant as possible for the proprietors. Efforts based on sound business principles, modified, as all efforts are, by humane considerations, have been very successful.

At South Manchester, in Connecticut, there is what, in many respects, is the most attractive mill village in the country. There may be similar villages equally lovely in other countries, but there is none in the United States. Pullman is an organization of a different kind—very much larger, very much more important, very much newer, but not nearly so charming. Pullman may be compared with South Manchester because it is based on very much the same principle. The people who live in Pullman, however, have nothing to do with its government except as it constitutes a district in the free-school system of Illinois, while every voter in South Manchester has a voice in the town government. In other respects, and especially in physical characteristics, Pullman is a decided contrast to South Manchester.

The Connecticut settlement lies about the silk mills of the Cheney Brothers; and it is worthy of description, because it illustrates a principle which obtains in very few mill villages, and shows how greatly both the employers and the operatives are benefited when the community of interest between them is strengthened. In South Manchester the Cheneys are not only the employers of their operatives, but their neighbors as well; and it is for their domestic comfort, as well as for their commercial advantage, that these neighbors should be as happy and contented as possible.

A visitor to South Manchester, especially one familiar with the common type of New England mill village, would find it difficult to believe that large red brick factories exist amid so much natural and artificial beauty. The village is scattered through a large park, and beyond into the open country. The ground is rolling, and the grass is beautifully kept. From one end to the other of the park there is not a fence; nor is there a garden, nor a pigsty, nor a chicken coop. There is an immense expanse of swelling lawns, hills, and dales, all as green as the North Meadow at its best estate. The shade is neither too much nor too little. There is plenty of it, and so is there plenty of sunshine. The trees are such as exist nowhere in New England outside of the valley of the Connecticut. South Manchester is about ten miles from Hartford, just beyond the rich grass and tobacco lands of the town of East Hartford. Under the trees are the mills, the offices, and the other business buildings of the company. On the ridges and in the low places are the houses of the proprietors and the workmen. There is about the place the atmosphere of an intelligent single purpose. The houses vary. The older Cheneys live in dwellings that are plain, in the fashion of thirty or forty years ago, and that have been added to from time to time in obedience to the demands of growing families or to the tastes of increasing possessions. Younger members of the family have built more modern and more imposing dwellings. There are houses in South Manchester representing every phase of the spirit of rural architecture, from the simple, well-proportioned gabled house, to the square, Mansard-roofed, five-columned Parthenon, and recently there have been ambitious efforts in the modern fashion—excellent examples of domestic architecture. Although there is this variety, the houses bear a stronger likeness to one another than is observable in the ordinary village. The operatives' houses may be classified. Some are for headmen, and some are for the cheapest hands. Between these two are other grades. There are, therefore, rows of buildings in which each house is precisely like its neighbor, and on the outskirts of the wooded park are some that are constructed after the familiar mill-village pattern. To one looking from the steps of the office over the lawns, and seeing the small cottages scattered here and there under the trees, no fences about them, no small enclosures of any kind, set down in the grove with regard simply to the neighborhood of the road, the place suggests an English park, with possibly a superabundance of game-keepers, foresters, and people and retainers of that sort. There are none of the attributes of a manufacturing town which, in Mr. Webster's view, made the lives of those employed in a factory so unwholesome, and so immeasurably inferior to the lot of the farmer who dwells amid the beauties of nature, and breathes the unpolluted air of the country.

At South Manchester the business of manufacturing is carried on without any of the ordinary accessories of the mill village. There are no dusty roads littered with the ash heaps, tin cans, and kitchen refuse of the houses. The roads are as good dirt highways as can be made in the sandy soil of the neighborhood. Gravel and red clay have done their best, and this best is very good. The sidewalks are the customary asphalt paths so popular in New England villages, not beautiful but very clean, and exceedingly useful in the long muddy springs of that part of the country, where the subsoil shrinks away from the frozen surface every night, and every morning finds the earth a hollow mockery. A great many New Englanders have a very keen appreciation of beauty, and especially of the beauty of verdure and foliage in villages, but they can never rise superior to their sense of comfort and neatness which is gratified by the winding tar or asphalt path.

In many a mill village one stumbles over cinder-strewn paths, or, generally, walks out in the road, for the sidewalk either does not exist or is encumbered with the wreckage and unkempt children of the bordering hovels. These hovels stand close together in long, eye-wearying rows. It is very seldom that a freshly painted mill tenement is met. Within a year of their construction at the farthest, the paint is blackened with the grime of the occupants' toil. Through their opened doors one may catch a glimpse of still more touching wretchedness—the wretchedness of the intimate life of the tenants. And this squalor and desolation are the more repulsive because they exist in incongruous surroundings. We are accustomed to them in the tenement-house districts of great cities. There, if anywhere, they are fit, but in the country, where land is cheap and abundant, it is shocking to find closely built rows of dwellings, with not a spear of grass near them, in front or in the rear, with no green thing save an occasional cabbage or potato patch, the bare ground ugly and littered, here and there offensive pigsties or goat stables. Near enough to be too convenient for the peace of the community is a groggery, where the men spend their leisure hours and their earnings, while slatternly women sit on the front steps and vent their grievances against man and the universe.

There is little hope for such people and little incentive to ambition. There is many a mill and mining town in this country in which there is neither church nor school, but although this cannot be said of New England, there are mill villages and cities in that enlightened part of the country where children are reared in such vicious surroundings that wickedness and crime may be almost said to be forced upon them. In the mill towns where there are no restraints upon the vicious, where the dissolute and depraved enjoy every opportunity for the indulgence of their appetites and passions, one is most likely to find the tenements of the corporations huddled together in such a manner that those who occupy them are compelled to be in almost constant close association. Respectable operatives and their wives shun employment in such places for a variety of reasons. In the first place, labor troubles are more frequent in such places; the misunderstandings and the disagreements between the bosses and the hands are never healed; discontent is chronic; wages are likely to be below the average. Good hands prefer to go where the feeling between the employer and the employed is more cordial; but, above all, good men and women do not like to expose their children to the temptations of the bad mill village; while the efforts to improve the social and domestic life of factory hands have been neither so numerous nor so successful as to make even the average mill village attractive to quiet, orderly, decent people.

In the bad village children are brought up among surroundings that would make the good fathers and mothers who do not know the evils and hardships of factory life shudder for the consequences. The children are exposed to temptations from their infancy. Before they are old enough to add their mite to the family income they are familiar with the lowest vices to which human nature is prone. If they become worthy citizens, they are saved as by a miracle. They are as badly off physically as morally. They live in ill-ventilated and dirty houses, and are nourished on insufficient and ill-cooked food.

And yet, notwithstanding this state of things, it is true that the condition of the working-men in factories has improved, and is now improving rapidly. The average mill town, bad as it is, would have been the dream of a philanthropist in England half a century ago, and although the mean parts of the great manufacturing cities of New England are monuments to dirt and degradation, there is much less misery and more comfort, more sweetness and light, than there were a few years back. There are more mill owners than the Cheney Brothers who are looking after the welfare and comfort of their work-people. There is an excellent illustration at Willimantic, Connecticut, of what good can be done in this direction, and the whole country knows what has been accomplished at Pullman.

It ought to be understood at the outset that the Cheneys do not like to have South Manchester spoken of as a model village, or that they are trying an experiment. Their place is more interesting than any other because whether or not it may be properly called a model village, or spoken of as an experiment, it is old; it is very beautiful; the ugly features of the factory town have been abolished; it is a successful and gradual growth from a sound business principle, which seems to have been carried out with much ability and consistency. It is not marked by the regularity of newness that characterizes Pullman; it is a well-grown, time-mellowed rural community, dwelling in a well-trimmed park, away from the clamor of the machinery with which it does its daily tasks. This village has been growing to what it is for a little more than fifty years. The principal mill buildings—red brick, many-windowed—stand in a treeless, grassy spot near the railroad station. There is plenty of sunshine pouring into the rooms, which is essential in the making of textiles. Almost immediately, however, one enters the thickly shaded place where the dwellings are. It is an essential feature of the village, and one which cannot be made too clear, that the men and women—they are mostly women—do not look from their homes upon the walls of their workshop. Whether it was by intention that the home and the workshop were separated as much as possible, I do not know, but it is probable that it was.

As nearly as can be ascertained, the ruling motive of the men who have built up South Manchester was that the village should be an agreeable and pleasant home for themselves and their operatives. They lived there, and worked in the mills, and they had no idea of spending their lives in the mill village of the period. Their landed possessions have become very large. The domain stretches to a great distance in all directions. They practically own the whole valley, having acquired for the village sufficient water rights for a good supply. Under the trees is a sufficient number of houses to constitute a village of some importance. Here is the hall, though not the town hall, which is between South and North Manchester. There is a free library and reading-room established in the former house of one of the older Cheneys. The library contains about three thousand volumes, and the reading-room, which is open to the people, is provided with an assortment of periodicals. The books of the librarian show that some of the girls in the factory are avid readers, and although fiction naturally predominates in the list of works taken out by them, history books, biography, poetry, and the old standards that conscience bids us struggle with are not neglected. The corporation has given the library and reading-room to the community, and it is expected that the former will soon be greatly increased in size and value.

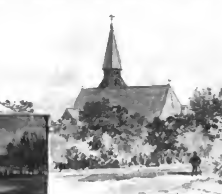
A library, however common an adjunct of a New England town, is not usually found in the ordinary mill village, and therefore this feature of South Manchester demands especial mention. Religious services have been held in the hall, but not for several years. Churches have grown up in the neighborhood of the village. Nearly all the sects are represented, and the spiritual food offered to the people is so plentiful and varied that the occasional services at the hall have been dispensed with. There does not seem to be any supervision over the working-people exercised by the heads of the establishment, other than is necessary to spare the place from desecration, and to preserve it as an attractive and agreeable home.

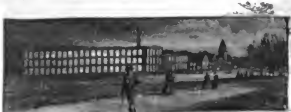
The stores of South Manchester are not built on the property of the company, because of certain restrictions as to the right to sell liquor which are in the Cheney deeds. The town of Manchester, like most other New England towns where local option obtains, is sometimes "license" and sometimes "prohibition." This year the people are getting on under the license system. The Cheneys are sometimes beaten in town politics, and occasionally they find themselves in a minority among the voters from their own end of the town, for they have neither the means nor the disposition to coerce their fellow townsmen, even though so large a part of them are employed in the silk mills. It is a very large family, and casts a very important vote. When there is a family gathering more than a hundred Cheneys assemble, and their fixed feasts are held in the hall. In the village directory there are more than fifty of the name, and among these, of course, the children are not counted. But these people, numerous and influential as they are, are guided by a very sensible principle. They hold that that town is governed best which manages its own affairs, and that they are the best citizens who follow their own independently formed beliefs. Therefore each Cheney, in public matters, is simply a townsman, and the corporation is nothing at all. If the Cheneys succeed in accomplishing an object, it is simply because their fellow-townsmen—employés and others—are convinced that the object is best for the general good. It is pretty generally the rule that good citizenship is infectious, and, as the Cheneys make no effort to control, their influence goes for what it is worth, and their own efforts in behalf of good schools, good roads, and public order are emulated by the other voters in the town, so that in reality South Manchester is managed, so far as its government is concerned, not by the men who own most of the property, and who maintain it, but by the operatives in the mills, and the people of the surrounding country.

The village and the business have grown together. It was in 1838 that the silk industry was established at South Manchester, and it has been maintained ever since, with probably a larger measure of success than has attended like efforts in Connecticut and elsewhere in America. As the business grew, and houses for the operatives were needed, the mill owners put them up in the park, and when there were a sufficient number near them, they went to the lands beyond, buying what they could get, until now their holdings are very large. The older and better class of houses do not stand very close together. They are comfortable cottages, much better than the ordinary factory tenement. The tenements are all painted the same color, and even the houses that are owned by their occupants, and are colored to the tastes of their proprietors, are not very dissimilar; so that there is an air of common proprietorship about the place, which is one of its few points of resemblance to the ordinary mill village.

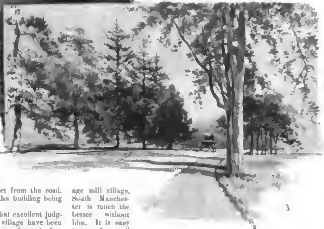
In carrying out their purpose to make South Manchester a place in which they could spend their days, its builders have recognized that they must have a community of friendly neighbors and good citizens. Friendly neighbors may be made by kind offices and by good-fellowship. Kindness is of different qualities. There are persons whose friendly offices are most offensive. There are others who gain the good-will of those with whom they come in contact by doing justice and by a kind consideration. There are, of course, poor and unhappy people in Manchester, but the sum of contentment is relatively very great. There are undoubtedly calls upon the employers for charity, but they are met unostentatiously. What must be understood is that here is not such a model village as a family would erect as a monument to its own benevolence. There are no buildings inscribed with the names of the "donors," nor is there a course of lectures, nor an old clothes or hot soup club, nor a temperance association, nor any device intended to remind the community in its daily goings out and comings in of the splendor of the employer's generosity. I fancy that there is no charity offered at South Manchester that is not needed. What is done in the way of keeping up the appearance of the village, and of increasing the efficiency of the school, is by way of benefit to the whole community, of which the Cheneys themselves constitute an important part.

The private affairs of a tenant and his family are not intruded upon in keeping up the appearance of the village. The houses, which are kept in good condition, are alone rented to the occupants, and there being no fences in the village, there is no enclosure. The lawns about the tenant's house are part of the verdure of the park, in which his cottage is situated; the proprietors look after that park, cut the grass, trim the trees, and do whatever is necessary to preserve its beauty. Each tenant has the advantage of the whole. South Manchester has certainly become, without any violent and sudden effort, one of the most delightful villages in New England. The main street, if there be a main street, skirts one side. As for the rest, the idea of streets is not suggested. The ways are like the winding roads of a park, on one or two of which the houses approach to within about a hundred feet, while the others run through the shady groves. Even the office of the company cannot be approached at the front with a wagon. It is several hundred feet from the road. There is a road in the rear, however, part of the building being used for a storehouse.





2



3

These details are essential to indicate with what excellent judgment and taste the landscape features of the village have been preserved and improved, the dwellings hidden away from the factory, the homes separated from the business. The same intelligence that has made of South Manchester a most delightful place of residence has had a good deal of opportunity to look after the welfare of the people in other directions. Most of the operatives in a silk-mill are girls. They are obliged to board, and experience has shown the employers that it is best for the girls to board in small families. Two large boarding-houses have been maintained; but one of these is about to be closed, and the other will be devoted as much to transient business as possible. As a matter of course, the increased value of a man who owns land and a home is recognized, and the mill owners are anxious to help their operatives who are desirous of building. They loan the money on houses built on property bought of themselves, which is naturally sold on restrictions calculated to protect the rest of the community from the intrusion of obnoxious trades and occupations.

It is unnecessary to go further into the detail of management of a place which, of all similar places, is managed so little. There is very little to describe where there is so slight, and at the same time so eminently sensible, a policy. The secret of the success of South Manchester as a village lies in the fact that the proprietors of the principal industry pursued there constitute a very large family directly interested in the mills, fellow-workmen with their operatives, who take an active and intelligent interest in public affairs, who are good neighbors themselves, determined to do all in their power, and to use their influence to the utmost, without intruding upon them or patronizing them, to make those with whom they live contented and happy. They do not want a brawling, unhappy community about them, and are averse to being surrounded by the unsavory abodes of uncared-for poverty. Therefore South Manchester is what this family has helped to make it, and the result is very gratifying.

Labor is contented in this village—as contented as it can be, for all sorts of human nature find their way there precisely as they do to Fall River. The poor and the unhappy are there as elsewhere. There are people who will not take care of their homes, and who cannot be prevailed upon to follow the general example; but they are exceptions compared with operatives and operatives' families in many other New England towns. There was a time when most of the girls who worked in the silk-mills were the daughters of neighboring farmers. This was the first experience of the cotton mills of New England. But this came to an end, and the American girl found occupations that were more suited to her tastes. She is coming back, however, although not in great numbers. When I asked if the return of the native was not due to the agreeable and attractive surroundings of the silk-mill, I was modestly informed that American girls were finding their way back to other mill towns. Nevertheless, it is permissible to believe that a well-brought-up New England farmer's daughter, educated in the local traditions of cleanliness and well-kept front yards, would rather go to a village like South Manchester, where the mill, with its dirt and discomforts, is not ground into her soul when she is at home, than to the ordinary mill town. The kind of labor that is employed in a silk-mill is, above all others, perhaps, the kind that would most thoroughly appreciate the charms of such a home life as can be had in the village which the Cheneys have built up.

The best evidence of the commercial value of the relations between employer and employed that exist at South Manchester is, of course, the absence of labor troubles. The testimony of those who are most familiar with the place is what is to be expected. There is very much less discontent among the working people than is ordinarily found in mill towns. There is a very much better and healthier feeling for the employés. There are no strikes or lock-outs, although there have been requests for an increase of wages, and occasionally a few men have knocked off. The hands are paid well and regularly. Their homes are pleasant. Their sick are cared for by good neighbors. They reap the profits of mill-hands, and are surrounded by the pleasures of rural life. And the working-man who cannot enjoy these advantages is hardly worthy of them. If he prefers the dirt and vice of an average mill village, South Manchester is much the better without him. It is easy to see from all this that the average character of the hand in these silk-mills must be higher than is to be found in less-favored places.

The silk-mills of Connecticut—the State ranks third in the Union in this industry—are not subject to strikes, so that it would be somewhat difficult to make a comparison by statistics which would fairly indicate the advantages of such a place as South Manchester to both the mill and the operatives. Wages in the silk-mills are high and occupation is constant. According to the report of the Connecticut Bureau of Labor Statistics, the rate of increase of wages in this industry has exceeded that of any other in the State with the exception of the carpet industry. In the latter, from 1860 to 1887, it was 58 per cent. for men and 63 for women; while in the former it was 53 for men and 62 for women. In other industries the rate of increase during the same period was very much less. In brass it was 39 per cent.; in clocks, 36; in woollens, men's wages increased 28 per cent. and women's 46 per cent. The average weekly wages of a foreman dyer in the silk-mills in 1887 was $23 92. Foremen in brass shops received $24, engineers in carpet-mills, $15; finishers in clock factories, $15, men burlers in woollen-mills, $13 29. These were the highest wages paid to men in each trade examined. How much better off the silk makers are may be seen by the number of people receiving more than the highest wages paid in cotton and woollen mills and clock factories. The foremen of spinners received $17 87; of winders, $19 23; of warpers, $13 04. The highest wages paid to women in the silk-mills were $6 44; in the woollen-mills, $5 68. The strikes reported in the silk-mills of Connecticut by the National Labor Bureau are very few, inconsiderable in extent, and, with one exception, unsuccessful. Not a single strike is reported as occurring at South Manchester.

The rare physical beauty of this village is largely owing to the fact that it is the growth of two generations. For more than fifty years art has been helping nature, so that the product has felt the gentle and beautifying touch of time. Such a village cannot be built in a day, nor can every manufacturer accomplish what the Cheneys have done. Notwithstanding their own assertion that in laying out and building up their mill village they have simply followed a business principle, and have consulted their own pleasure and convenience in making their neighborhood seemly, and the people who must be their neighbors contented, it is the fact that a very large wisdom has been brought to bear upon the problem of the relations of capital and labor, and very excellent taste has been manifested in the creation of the park-like village. The selfishness which professes to be looking out for its own interests in improving the community about it, very closely resembles good citizenship. There are other proprietors of mills who live near their works, who like pleasant surroundings, but who never dream of beautifying the dwellings of their operatives. There are some who will tell you that their operatives prefer to live in dirt and squalor. They take care of themselves by building their houses outside of the village, and shutting out the sight of it by fences and plantations. The village is only an unpleasant incident of the family's afternoon drive. There was a good deal of wisdom and humanity in the conception that the life of the employed would be pleasanter and more comfortable if the neighborhood were well cared for and happier. There is something good implied by a pained recognition of the wretchedness about one. Before another South Manchester can be made, some one with the patience and taste of the Cheneys must own a mill. It is not every mill owner who knows how to deal effectively with a landscape, who appreciates the true value of trees and the real beauty of lawns. In judging as to the probabilities of other similar villages, it must be recollected that the makers of South Manchester were pioneers in removing unsightly fences, and that the people of many a New England village have to thank them for taking the initiative in this admirable reform. In this park also there are no ploughed lands. The earth and what it produces are made to serve the sense of beauty. How many persons are there in New England who would agree to sacrifice so much space to trees and grass? Who would refrain from having their vegetables grown within sight of their piazzas and parlor windows? The men and women who work in the mill at South Manchester are very fortunate in having for employers men who have not only the desire to make a pleasant and charming village, but who have the means and the knowledge to do it, who realize the fact that in such a community as theirs their hands are their neighbors, and that a mutual good-feeling is essential if the community is to be agreeable.

In all that I have said it will be easily seen that the Cheneys have not undertaken to do anything that they wish talked about. They have especially refrained from taking the position of philanthropic builders of a model working-people's village. They have not done a charity to labor; they have simply, good citizens as they are, done their utmost for the village in which they live. The founder of the Village Improvement Society in Stockbridge, Massachusetts, worked in precisely the same direction, and would have accomplished as much if he had owned nearly all the land in the village, and most of the inhabitants were his working-people.

The bearing that all this has upon the labor problem is not difficult to determine. The people who made and maintain South Manchester are, like sensible men, getting along with their wage-earners as comfortably as possible. The discontent of people who work for wages will not be ended suddenly, nor by any efforts from the outside. Philanthropists and agitators may do their best and their utmost, but the existing relations will not be changed by anything which they may say or do. There will be no revolution, but there is even now going on a potential evolution which will eventually, though probably not in our time, put an end to many troubles that now cause much unhappiness and wretchedness, abolish much of the discord that now interferes with industrial progress, and raise the average of humanity by enormously improving the man at the bottom. Such conditions of life as obtain at South Manchester are helping the world forward to the better state of things, for they show how valuable to all concerned are trustful relations between those who are interested in the same enterprise. Peace will come with the recognition by employers and employed of their mutual dependence upon one another, and with the close community of interest which is felt by those who know that the prosperity of each depends upon united earnestness and endeavor. And in this view South Manchester would hardly be worth talking about if it had been built by the manufacturers for their operators—a model village. It is interesting and important because it is the outgrowth of the desire of the employers to live on good terms with the employed.

HENRY LOOMIS NELSON.

multiplied, and the subjects will become so trivial, as greatly to impair the authority and the dignity of reports on exhibits of importance."

The "American system," with proper restrictions and greater care in preparing application blanks, gives the practical solution of this very difficult problem.

(2). While there are many minor motives that prompt exhibitors to make displays at an exposition, the one great incentive is that of commercial gain, which can be met in some cases only by direct sale. Here the management must proceed cautiously. To draw the lines too closely would be to deprive many exhibitors of all benefits derived from the expense of their displays, and prevent the visitors from taking away with them purchases that would prove interesting souvenirs, and in some cases the introduction or development of new industries in the country, yet to be too liberal would result in lowering the standard of the exhibition to that of a trinket-vender's shop. The rivalry of salesmen would soon become so disgusting to visitors that the great educational features in other departments would be lost sight of, and the public criticism would bring about a practical closing of the gates. The rules and regulations of past expositions bearing upon this point have been not so much in error as the enforcement of them. Very great injustice was complained of at Paris during the past summer by many exhibitors, but especially by those in the United States section, who, at first, found much difficulty in getting even the most just concessions, while other departments seemed to find no restraint whatever.

(3). Another vital and perplexing problem always presents itself. How can all departments of the exhibition be opened at the appointed time? This question must be early taken in hand, and must receive the daily personal attention of the manager. He must be kept informed of the progress of exhibits in each group, and by just but strict rules urge, if not compel, the delivery of goods in time to be placed for the opening.

The financial failure of the Vienna Exposition of 1873 was due as largely to the incomplete state of exhibits at the time advertised for its opening as to any other cause. There has never been an exposition held that has not suffered more or less from this difficulty.

(4). Any one who has ever taken up the work of visiting an exposition must soon have found that a few hours of uninterrupted study of exhibits is not only wearisome, but that anything beyond this defeats the very purpose of the study. How often, after studying a nation's art collection in some great exposition, has the student, wearied by that study, passed into the adjoining gallery—to that of some other national collection—and turned away in disgust, or at least disappointment, at the unfavorable comparison, only to find his judgment reversed on a subsequent visit!

This same difficulty may be more clearly illustrated by calling attention to similar experiences in the great galleries of Europe, where, after the enthusiastic admiration and study of a certain school of painters, one passes to that of a different school. The latter may be of just as high standard; the critics may have long since sealed it with their stamp of approval; but the mind of the visitor has been turned for the time in a different channel, and in its exhausted condition positively refuses to take in the equally great but widely different beauties of the other school.

A rest is needed before doing justice to the second problem. Realizing this fact, a wise management will not only provide that means of rest, but will fill the time with entertaining concerts, piano and organ recitals, or even lighter amusements, where both the physical and mental man may be rested for a new beginning.

(5). "Tariff for revenue only" is the principle on which all exposition charges should be made. The manager is compelled to look squarely at two great facts in his work. First, he must receive revenue from every legitimate source, or meet an unfortunate balance-sheet, which means the worst of failures. Revenue is a grievous tax, every levy of which tends not only to defeat the important features of the work, but to reduce the amount of the revenue itself. A manager's guide in this [illegible] must be his experience, often bought at a [illegible]ice. The revenue is derived from three sources—admissions, privileges or concessions, and charges made aga[illegible]t exhibitors. The first is usually set by the nation's custom. The second, while it is a most legitimate source of revenue, yet, if overtaxed, forces those purchasing the concessions to extortion, which soon cuts the revenue from all sources, and brings down the worst of criticism upon the management. Experience alone can insure a proper adjustment of these prices. What will be just in one nation will be extortion in another. A percentage that would be just in one line will prove excessive in another. The last source of revenue is the most delicate to handle. The exhibitors and managers are emphatically of "one house," and if the house be divided against itself it will surely fall.

In the international expositions of the past but few charges have been levied upon the exhibitors. Their space has been granted to them free. Their passes come easily, and with little or no cost. Their goods upon arrival were handled at the lowest possible price, or, as in the case of Philadelphia, all terminal charges were found impracticable, and the original order charging one dollar for each package of 500 pounds or less was rescinded, and charges already collected were returned. This was not because the tax was unjust, but simply because the difficulty of collecting the tax made it both unprofitable and unpleasant. The expositions of the future, however, must take hold of this question with vigor. It will no longer do to turn the space over to the exhibitors, and say: "Here, we charge you nothing for the building. Now fit it up in a proper manner at your own expense." The result of such regulations in the past has given us a class of exhibits. One exhibitor spends time and means in designing an artistic arrangement of cases and drapery. He may have paid much attention to graceful lines and color effects, only to find placed in adjoining spaces exhibits of no artistic pretension, or whose "studied niceness," when placed in juxtaposition to his own, may ruin the effect of both.

The standard of exposition arrangement has been materially elevated by the recent Parisian example. The contrast between the artistic arrangement of exhibits in the French sections and the sad conglomeration of American exhibits was not a subject for patriotic contemplation. In the future the management must assume a larger dictation as to all placing of exhibits and design of cases. This will incur a tremendous additional expense, all of which is a proper tax against the exhibitor, and its adjustment should be made with great care. Exhibitors will stand a considerable tax, if presented to them in proper form.

In the past the giving of medals has been a serious tax upon the exposition, where it should more properly remain than, for instance, the terminal charges. But experience has taught that the terminal charges, which properly belong to the exhibitor, are best assumed by the exposition management, while the exhibitors seem to be quite delighted to stand the cost of issuing their medals. Paris, even after agreeing to deliver medals free, changed her mind, and decided to issue only certificates of medals above the bronze value. I have yet to hear of any one who objected to paying the price.

(6). The question of admission prices is best determined by the manner in which the people of the nation giving the exposition have been educated. In Paris last year the admissions were as follows: Students' hours (8 to 10 A.M.), 2 francs; during the day, 1 franc; during the evening, 1 franc; Sundays, 1 franc; during the Exhibition, 100 francs; fête nights, special prices.

Once upon the inside, however, there were endless numbers of special exhibits and conveniences, for which one had to pay to enjoy. The outer edges of the grounds were dotted here and there by "side shows" of nearly every nature, for which an admission of one franc was usually charged. An extra charge was made to see the pastel exhibit, and the same for the water-color collection. If the weary visitor innocently sat in one of the thousand chairs placed around the grounds, he was immediately presented with a bill. If at the fountain illumination in the evening he mounted a seat for a moment to get a little better view of the display, he was sure to be interrupted by a female attendant, who insisted upon payment for use of same. This matter of extra charges was carried even farther than this, apparently with little protest. The American people will stand nothing of this kind. They are willing to pay a good round sum for admission; but once in, they emphatically protest against extra charges.

(7). Placing before the world a large number of well-selected exhibits properly housed, and all details of management wisely looked after, should be the primary object of exposition management, but the introduction of a high standard of novelties, if such they may be called, should also come in for its share of attention. International scientific congresses, held in some suitable hall erected on the exposition grounds, give dignity and character to the occasion. Some striking features, like the Eiffel Tower, arouse the curiosity of the world. The illuminated fountains of the Glasgow and Paris expositions played no small part in the success of those undertakings. Special days should be selected, in commemoration of great events or ideas, where the expressions of patriotism and kindred sentiments can be appealed to, to break the monotony of a six months' exhibition.

(8). While, for the sake of comparative examination on the part of the judges and visitors, a wise installation system demands that all the exhibits in any one group be placed together, yet the conflicting interests of exhibitors must not be lost sight of. Any one who has had to deal with a considerable number of exhibits in a musical department of a large exposition realizes that there are problems of this kind that must be settled before the exhibits are placed.

(9). To say that there were six thousand four hundred and sixty-three patients treated by the Medical Department of the Philadelphia Centennial, suggests another problem that the management must look well to.

(10). It is argued by some persons that there is not time in which to prepare for a great World's Fair to be held in 1892. That the exhibition will suffer in some particulars may be true, but the very nature of the situation gives the American people an opportunity to show one of their strongest characteristics—the power of bringing great results to pass in an incredibly short time.

There was no exhibit at the recent Paris Exhibition that spoke louder praise for French manufacturers than the fact that the seventeen acres of corrugated glass used in the construction of buildings were all made by one house in two hundred and forty days, and of the eighty workmen employed, not one was of foreign extraction.

SNOW-BOUND IN THE SIERRAS.

The Rocky and the Sierra Nevada mountains, which so greatly tax the forethought and constructive ability of the civil engineer in the building of railways through their rocky barriers, also cause the railway companies much difficulty in the operation of the roads after their completion. When the line has been located through the narrow winding passes which divide the mountain ranges, and the immense work of blasting tunnels and deep cuts through the rocky location, with the frequent turning or bridging of the channels of foaming streams, has been effected, there remain constantly to be combated the devastating floods of summer and the snow blockades of winter. Even in the most arid and parched regions of the elevated plains, the high mountain ranges that separate them constantly gather clouds which condense and fall in rain or snow. The loftier peaks, which until midsummer have retained their snowy mantles of the winter before, begin in early autumn to don their white caps, and they whiten from the tops downward as the season advances; by November the peaks of the main range are a procession of snowy pyramids. The snow-storms of the Western mountains and of the high plains at their feet arise almost without warning, and the dry snow caught by the gale is rent into an impalpable powder, which is blown horizontally like a mist along the ground. Along a smooth surface this fine snow whirls without lodging, but wherever it encounters an obstacle it instantly forms a drift, and it curls into and masses deeply in the hollows. This snow mist is drawn together, as if into a funnel, by the strong winds that suck down through the cañons, and as it sifts rapidly into the channel cut through the snows on the line of the railroad track, it is beaten down hard by the wind, which packs it so solidly that sometimes a team and wagon can be driven across a snow-filled hollow without hoof or wheel sinking deeply enough to obstruct their progress.

Early in winter the liability of trains to encounter a blockade is comparatively slight. The snow-plough then can usually be forced through the snow, scattering it to left and right. The drifts thus created remain by the track without melting, and every storm adds to the walls of a narrow channel, which serves to catch and retain the snow whenever it is blowing. But from mid-winter to mid-spring the thick clouds that hang about the mountain peaks break in earnest with driving winds, then the trains of the transcontinental lines that are so unfortunate as to be caught in a storm are usually brought to a stand-still, and the passengers and train-men have a weary siege of it. Without warning, a dense cloud swirls down the mountain pass, borne on a suddenly risen and shrieking gale. The eye can scarcely penetrate, even for a few feet, the air thick with driving snow. Even when the day is mild and fair upon the plains below the foot-hills, a storm may be raging fiercely in the mountains, and at times when the sky is clear about the peaks a gusty wind may lift and bear onward the snow that fell at a former time, and cause serious drifting in the railroad cuts.

When it is found that the train is snow-bound and cannot proceed, the first effort of the train-men is to back it to a siding; if this manœuvre is successful, it is fortunate for the passengers, who can wait in comparative comfort while the snow-plough is being brought up and placed before the locomotive. Whether they are to remain for one day or ten is in such cases a matter of profound uncertainty. If the blockade occurs late in the winter, often several snow-ploughs, backed by powerful locomotives, are unable to penetrate the drifts upon the track. Then there is nothing to be done but for the train-men and all railroad laborers that can be summoned to fall to shovelling. The passengers, weary of sitting in the cars and anxious to proceed, often turn out and assist them. Within the coaches of the train there is usually a sufficiency of fuel, and the passengers seldom suffer from cold; but when the train is caught between stations, those travellers who have not provided themselves with well-stocked lunch baskets sometimes realize keenly the pangs of hunger before food can be got to them.

The peculiar difficulties developed in the way of snow blockades in the railways crossing the great mountain ranges have led to the invention of the rotary snow-plough. This machine is vastly more effective for its purpose than the "beater"-shaped plough formerly in general use, which depended for its usefulness upon the capacity of the locomotive to drive it like a wedge through the drifts. When the snow is of considerable depth or solidly packed, the old-style plough cannot penetrate it. The rotary plough, with its revolving cylinder, which works somewhat on the principle of the cylindrical knives of a hay-cutter, easily carves its way through snow, even when the drifts are of considerable depth and hardness. With snows so deep as those which sometimes fall in the Rocky and Sierra Nevada mountains, even so powerful a machine as the rotary plough cannot supplement the need of extensive shovelling, but the saving in labor and time effected by their introduction has been important.

The change caused in the appearance of a prairie or mountain landscape by a heavy, drifting snow is remarkable; the entire scene assumes so strange a look that even a person familiar with the locality often finds it difficult to identify the landmarks. The filling of hollows, and the formation of great drifts, the total disappearance of many objects, and the different appearance of others partially buried—make the whole aspect of the scenery seem strange. The illustration by Mr. Charles Graham depicts a scene of the recent protracted snow blockade in the Sierra Nevadas, when many miles of the Central Pacific Railroad disappeared beneath a solidly packed field of snow, the locality of the railway being indicated only by the telegraph poles, which for long distances barely peeped from the great drifts formed beyond the track.

On such an occasion snow-ploughs and shovellers work indefatigably night and day at both ends of the blockaded part of the road, and the busy wires, if haply they are not down and useless, announce their progress as a few miles at one or the other end are opened, or some half-buried train is rescued. Happy are the laborers if they effect their task without serious frost-bites or worse accidents, and before another storm arises to efface the result of their labors. When at last the two forces of workers have met, and the welcome news is telegraphed to head-quarters that the road is clear for through travel, the vestiges of the storm remain in the wrecked locomotives and snow-ploughs that have rolled down the embankments, and in the great walls of piled-up snow upon either side of the track.

SEEING THE METROPOLIS GROW.

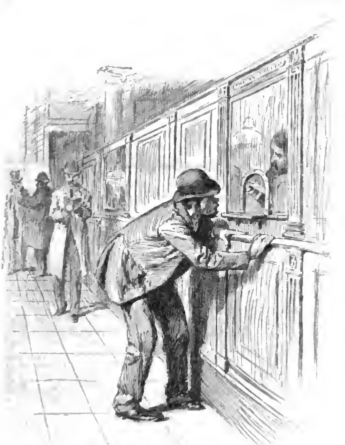
Henry Adams, in the lately published instalment of his *History of the United States*, reminds us that the population of New York city in 1790 was 33,000. In a hundred years this comparatively small community has grown into a metropolitan aggregate of 3,000,000 people, second only to that of London in numbers and importance. It matters not that the political boundaries of the city have not been advanced *pari passu* with its widening limits; the region within a radius of ten miles of the City Hall is none the less an organic and economic whole. Its life-blood circulation pulsates from the common heart as strongly in Brooklyn as in Harlem. The currents of humanity which are daily flowing back and forth across the East River and the Hudson are as permanent and regular as those which course north and south on Manhattan Island. The metropolis grows in the line of the least resistance, with more or less reference, perhaps, to nearness to the Post-office, but certainly with none to the factitious and hide-bound conditions of the municipal government. The vast aggregation of humanity which is collected about the harbor of New York, transacting the business at the main gateway and the financial and commercial capital of the nation, is practically one body, in virtue of local relation and community of interest, and must be so considered. Though there be several sets of public officers, as there were in London before its recent governmental consolidation, there is really but one city.

From 33,000 to 3,000,000 people in a hundred years represents a wonderful growth. But in contemplating it and the advances of shorter and late periods, the impression is apt to prevail that the observation is taken from a stationary standpoint; that a comparative, fixed condition of things has been reached, and that the chapter of marked progress is in a sense closed. Nothing can be farther from the truth. Never did the metropolis go spinning "down the ringing grooves of change" at a greater rate than it is going at present. Never were the evidences of growth and improvement more numerous and significant. There is activity in the old portions as well as in the new, due to the necessary adaptations to the movements of trade. A notable shifting of residence districts is taking place in consequence. Boarding-houses are supplanting private houses in many localities, and, in turn, many of the former are lapsing into tenements, or their neighborhoods become otherwise undesirable, and remain so until they are absorbed in the wholesale business region.

Retail establishments are pushing their way up Fifth Avenue and through Forty-second and other streets, so as to visibly affect large sections of the brown-stone districts. Brown-stone itself, once the exponent of wealth and uppertendom, has fallen from its high estate and descended to tenements. The gloomy and uniform architecture, too, that accompanied it has been succeeded by the fruits of better taste and by cheerful variety. The long and sombre corridors that constituted the old "uptown" streets are being gradually exchanged for brighter thoroughfares and houses built of less depressing material farther north. Between Central Park and the Hudson River the buildings are thickening with great rapidity, and a new residence district is already firmly established there. Flats continue to multiply ubiquitously.

Down-town a signal transformation is also going on. Wall Street would scarcely be recognized, save for a few old landmarks in the shape of public buildings, by one who had been away from it for a few years. At frequent intervals on Broadway and adjacent streets roofs may be seen mounting skyward in a way that amazes the returned wanderer. The hotel capacity of the city is being enlarged in prominent instances. The Metropolitan and Natural History museums are assuming dimensions and a character that make them a source of local pride, and among the new possessions is a picture-gallery which, though yet in its infancy, has suddenly risen to deserved fame. Fine and spacious club-houses have lately made their appearance in marked numbers, and others are in process of erection. One specially large and comprehensive place of amusement is rising on the site of the old Madison Square Garden. A large music hall has just been opened near Central Park, and a new opera-house is projected not far distant. Looming up in the mind's eye is the Protestant Cathedral, which, it is promised, will be the crowning architectural glory of the city—until something finer appears.

But the clearest indication of the onward and irresistible march of the metropolis is the degree to which it has outgrown its transportation facilities. The theory that the operators of public conveyance systems must supply their fares with seats, as is the practice in transatlantic cities, has become in New York a vague and distant memory. The elevated and surface railroads are taxed morning and evening to their full limits. Movements for relieving the pressure and meeting the growing demand have been agitated for several years, and the State Legislature is this winter imperatively called upon to give serious and prompt consideration to measures whereby the desired end may be attained. The inadequacy of means of transit on Manhattan Island has aided materially to an increase of population in Brooklyn, which, without such help, would have proceeded



FERTILE IN EXPEDIENTS.

PAYING TELLER. "I tell you I can't help it if your name is Malone: you can't get the money on that check unless you are identified."

MALONE. "Hould a bit, wud ye! Oi'll bring Jim Maginnis in an' inthroduce ye to him, an' begorra he kin aidentifoy us both. Phat name, sir?"

with sufficient rapidity. The East River Bridge also testifies with its overcrowded traffic to the steady enlargement of the general metropolitan community. An improvement in the terminal facilities of the bridge is about to be made, and soon its full possible capacity will be reached. Already it performs a much greater service than it was intended to accommodate. Meanwhile the ferries push their business with unabated industry. Projects for other bridges are on foot, and a bill providing for one at Grand Street is now before the Legislature. Still another, with piers resting on Blackwell's Island, is foreshadowed. A tunnel under the East River is likewise contemplated. Not long since a new ferry was established between the Battery and South Brooklyn. This part of the city is persistently pressing its way toward the Narrows. The time is not far distant when it will be facing Staten Island at short range, which, in its turn, will soon furnish dock terminals to the railroads from the South and West. A bridge has already been thrown across one of the kills to the main-land, and the transportation connection with the water front will result in an important development of the resources of our matchless harbor, as well as multiply the warehouses, factories, dwellings, and general business of the island.

Elevated railways have been inaugurated in Brooklyn on as extensive a scale as in New York. Already three lines radiate, fan-like, from the end of the bridge, and as the room for growth is unlimited and unobstructed on all sides save that of the river, the process that is going on is readily comprehensible. It can be seen how the interdependence of the different parts of the metropolitan centre is linking them together with new bands; and more and more means of intercourse will be established across the dividing rivers as the consolidating process and the need grow stronger. The tunnel which is being carried under the Hudson is another sign of the times, as well as the new aqueduct, which will much more than double the water supply. A better system of pavements is also about to be inaugurated, and the noise and roughness of our present stony streets will gradually give place to comparative quiet and ease.

So much for some of the physical evidences that New York is moving along on a swift current of increase and improvement. The census is not needed to tell the story to the observing. And especially of late years, with this outward growth there has been an inward strengthening of the metropolitan character of the city. More than ever the mental equipment of men of the first rank, wherever born and reared in the country, sends them to New York. It is the same tendency that has been revealed in Great Britain. The literary activity of Edinburgh found its way to London. Has not that of Boston similarly drifted to New York? That the metropolitan bar attracts lawyers of the highest ability from elsewhere, as the loadstone does the needle, cannot be questioned. More and more, too, does the city confirm its financial supremacy. Banking, railroad, commercial, and manufacturing chiefs, as a rule, have their head-quarters here. The contest for the location of the World's Fair of 1892 has done something toward awakening in the minds of many people a proper appreciation of what this metropolitan centre really is. And yet it is but in a state of rapid transition into something greater.

There is a time in the far future when New York will cease to grow, but it is not within a calculable distance. Mr. Gladstone has warned his countrymen that the commercial supremacy of the world may be transferred to these shores before many years, and no authority has yet appeared to place a limit to the population of the United States. Mr. John Fiske, who is not given to extravagances, in his paper on "Manifest Destiny," mentions 600,000,000 as the not improbable population of the United States a century hence. The stream which is carrying the nation thus forward is not leaving its metropolis behind. This much at least is evident to any citizen noting the activities around him, the changes already going on, and those about to be inaugurated. It is all important that there should be a realization of the steady growth and expansion of the city on the part of those who are wrestling with the problem of its outgrown clothes.

AMOS W. WRIGHT.

MONEY AND SECURITIES.

FOR the first time in many weary weeks the Stock Exchange markets have begun to give signs of life. During the last quarter of 1889 these markets were held continuously in check by the high rates for money, and the activity in the money market continued well into the present month. As long as it was evident that an effort to stimulate trading on the Stock Exchange would be promptly reflected in greater stringency in the loan market, it was useless for any of the large interests centring in Wall Street to attempt to attract the public to that locality. While money worked closely, a speculative element that is ever present in Wall Street, and ever ready to emphasize the misfortunes that now and then overtake the schemes of their fellow-men, was enabled to make a good deal of an impression upon prices, especially as one untoward incident followed another with an appearance of fatality. Of course developments favorable to better prices for various securities were passed unnoticed during that period, and continuing influences that affect values generally, like large and increasing railroad earnings, were perforce ignored. It is almost needless to add that Wall Street, which is a very impatient community, became gloomy and pessimistic during this period; and when the market failed to start up, as many people expected or hoped it would, immediately after the first of the year, expressions of despair were wellnigh universal in the environs of the Stock Exchange.

The week now closing has witnessed something of a change at the financial centre of the country. In the first place, the supply of loanable funds at New York has been materially increased since the beginning of the year. The surplus of the reserves of the Associated City Banks, which was down to almost nothing a month ago, has now reached figures that show that the banks can increase their accommodations without inconvenience. Borrowers of all classes can now obtain the funds required in their business without paying rates that make serious inroads into profits. The average rate for call loans on pledge of acceptable Stock Exchange collateral was 4 per cent. yesterday, and to-day 3 per cent. fairly represented the market. Time money is offered in large amounts at 4 per cent. for four months on pledge of dividend-paying securities. A little higher rate is exacted on mixed collateral. First-class borrowers having Stock Exchange connections are being pressed to take time money at these figures. The relaxation has also extended to the market for commercial paper, so that mercantile houses in good credit can dispose of their bills receivable at 5 per cent. as against 6½ to 7 per cent. thirty days ago, and prime single name paper can be disposed of at 5½ per cent. A description of the money market would not be complete that did not note that lenders or their agents are now seeking employment for their funds, whereas during the last three months of 1889 borrowers, as a rule, had to importune them for accommodations, and submit to whatever rate might be made.

The change that has taken place in the money market is noted in detail because of its important relation to the market for securities, and it now looks as if that change would be turned to account by people who can make or unmake that market. A steady advance in the prices for a number of the leading stocks, that has been accomplished without any demonstration of a flippant character, has inspired a good deal of confidence in a class of people who are always ready to take an interest in the stock market, or increase an existing one, when they think they detect a definite tendency of prices, especially if the tendency is toward improvement. The result has been a gradual increase in the volume of transactions, and a perceptible broadening of the market. This is true not only of the stock-market, which the superficial observer is liable to accept as the only index of the course of events in Wall Street, but also of the bond market. When there is an active demand for good railroad bonds and other investment securities, it is quite safe to assume that an increase in speculation is not far distant. It reflects legitimate business in the security market, and there can be no better basis for dealings in less substantial issues. With time money down to 4 per cent., large corporations, like insurance companies, which must get every cent possible out of their resources, will turn their cash into safe bonds that will yield 5 to 6 per cent. Capitalists pursue the same policy, and both endeavor to buy such bonds as they want before a new equilibrium is established between a relaxing money market and that for securities.

While the stock-market seems to reflect something approaching unanimity of action on the part of the principal manufacturers of and dealers in railway and kindred securities, they must be conscious of the influences that are likely to retard a return of the public to Wall Street, or at least lead it to exercise unusual caution in doing so. The memory of the average habitué of Wall Street is proverbially short, and, judging from the many distressing experiences of those who invest their money in railway stocks and bonds, the mind of the public is not more retentive than that of the broker it employs. It remains to be seen if both will forget or assume to ignore the blows that have been struck at confidence in the Reading episode, and by the persistent efforts of the creditors of the Atchison Company to secure control of that corporation after the stockholders have made every concession that they have been asked to make in the interests of the bondholders. An enumeration of other conditions affecting the stock-market would exceed the space already devoted to the monetary situation. At the moment, it seems necessary simply to note that the money market at this centre has reached the condition that it usually does at this time of the year, and that the opportunity to stimulate business in Wall Street that is thus afforded seems likely to be improved.

COLLIN ARMSTRONG.

NEW YORK, Saturday, January 25, 1890.

HATEFUL BLOOD RELATIONS.

HATEFUL kindred are those sprung from the parent stem—malaria. They are chills and fever, bilious remittent fever, dumb ague, and ague cake. These foes to bodily peace are all blood relations, as there is no doubt that these endemic complaints are produced by contamination of the blood by the miasmata existent in both air and water in malarious regions. Hostetter's Stomach Bitters expels from the blood the virus with which miasma infects, but it does more than this, it neutralizes the atmospheric and aqueous poison and its germs before they have permanently fructified in the system, and thus effectually protects against it the fierce inroads of this diabolic brotherhood of diseases. Thus it is not only a remedy, but also a preventive, prompt in relieving, lasting in effect, perfectly efficient. Nervousness, biliousness, dyspepsia, and kidney trouble also succumb to it.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

CHORAL MUSIC.

NOVELLO, EWER & CO. (London and New York), the largest publishing house of Choral Music in the world.

Our Catalogue contains a list of the works published by us of the representative composers of all nations who have written *Choral Music*, from the smallest Part-Song and Anthem to the largest Cantata and Oratorio. It comprises works of all degrees of difficulty, and of the many different schools of writing, from the works of Bach, Handel, Haydn, Mozart, Mendelssohn, and Schumann to those of the most modern writers, such as Barnby, Brahms, Cowen, Dvorak, Gounod, Liszt, Mackenzie, Saint-Saëns, Stainer, Stanford, Sullivan, and others.

The rising *American School* of Composers, a few of whom are Dudley Buck, A. W. Foote, Henry Holden Huss, F. L. Ritter, Richard Henry Warren, etc., etc., is also largely represented in our Catalogue.

Our editions are acknowledged to be the best printed, the most carefully edited, and, therefore, the most correct editions of all, besides being at the same time the cheapest.

Price Lists and *Catalogues* mailed free.

Sample Copies sent on selection to Choral Societies and Conductors.

NOVELLO, EWER & CO.,
21 East Seventeenth St., New York.—[*Adv.*]

"THE TRAVELERS."

A PROSPEROUS YEAR IN 1889.

THE TRAVELERS has earned prosperity by the quality of its wares; not alone by the security of its guarantees on such contracts as it puts forth, but by the variety and excellence of those contracts themselves. Its new Annuity plan and its admirable Ten Premium Accident Policies—among the best novelties developed in insurance within the decade—have deserved and attained high popularity, and have aided in making 1889 a highly prosperous year for the company. It has added over a million dollars to its assets and a quarter of a million to its surplus; has written a million more new life insurance than in 1888; and has returned to its policy-holders within the year over a million and a half—more than a million of it under Accident policies. "Moral: Insure in the Travelers," relates as well to the solidity of the company as to the uncertainty of life. Assets, $11,528,649.30. Surplus, $2,365,534.06. —[*Adv.*]

A GOOD REPUTATION.

"BROWN'S BRONCHIAL TROCHES" have been before the public many years, and are everywhere acknowledged to be the best remedy for all throat troubles. They quickly relieve Coughs, Sore Throat, and Bronchial Affections. Price, 25 cents. For sale everywhere, and only in boxes.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

PEOPLE of sedentary habits undergo more or less strain on the nervous system. Nicholson's Liquid Bread overcomes this, and adds new life and vigor. Give it a trial. Druggists and grocers keep it.—[*Adv.*]

CORNELL'S BENZOIN COSMETIC SOAP
Whitens the hands, softens the skin. 25 cts.—[*Adv.*]

BLAIR'S PILLS.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists. —[*Adv.*]

MOUTH ORGAN Chart, 10c., teaches a tune in 10 minutes. Agents wanted. Music Novelty Co., Detroit, Mich. —[*Adv.*]

AFTER a sleepless night, use ANGOSTURA BITTERS to tone up your system. All Druggists.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c. —[*Adv.*]

A SPRING medicine is needed by every one. Winter food, largely consisting of salt meat and animal fats, causes the liver to become disordered and the blood impure, hence the necessity of a cleansing medicine. The best is Ayer's Sarsaparilla.—[*Adv.*]

HARPER & BROTHERS, NEW YORK.

AMERICAN CHORAL SOCIETIES AND CONDUCTORS.

BY H. E. KREHBIEL.

NO one who has not been, or is not, a member of a singing society can appreciate the significance which amateur choral culture has attained in this country as the promoter of musical love, taste, and understanding. Distantly it may be apprehended by such a one; fully understood and justly measured it cannot be. These singing societies which are springing up and flourishing throughout the sections of our country where the influences of New York and New England are felt, even in the sparsely settled States and Territories of the distant Northwest (Yankton, Dakota, heard *The Messiah* last April), are the characteristic feature of latter-day musical culture; and they tell more of the spread of that gentleness and refinement of feeling which is the best fruit of music than any other artistic activity that our present civilization discloses. Under other circumstances I might say that the love and practice of chamber music are the truest touchstone of musical culture; but chamber music, in its best estate, is your aristocrat among musical forms, and its blessings are for the specially gifted few. The spirit of genuine artistic democracy is the inspiration of choral culture, however, and marvellously puissant is the influence which it exerts. It makes little difference whether the singing society be a proud metropolitan organization which piles up its hundreds of singers in terraces for the annual Christmas-tide production of *The Messiah*, or a country choir that looks up to "Sound the Loud Timbrel" as the pinnacle of its wildest ambition, the influence which it sends through its community, like currents from so many galvanic batteries, is the most potent and helpful medium which the art of music has. It is thus potent and helpful because it is the best of all schools for teaching the things which the people most need. If every city, town, village, and hamlet in America were suddenly to become possessed of an earnest determination to be musical (in fact, not merely in affectation) there would be no need of swelling the number of music teachers already in the country by even one. Not one finger more would need be taught to walk "with gentle gait" o'er "dancing chips," not one poor head more would need to be bewildered by confusing talk of "registers" and "pharynx" and "larynx" and "vocal chords." The things truly needful might and should unconsciously be taught in the meetings of singing societies—love of music and the art of listening to it. To sing in a choir is the quickest, surest, and best way to become intimate with music, to get close to the seat of its emotional life, where its heart-throbs can be felt and heard; to "experience" it, as your good Methodist class-leader would say; to hold communion with its gentle saints and glorious heroes; and meanwhile to lay up a store of artistic treasures which neither moth nor rust can corrupt, and with which memory can delight itself even after the voice of the singer,

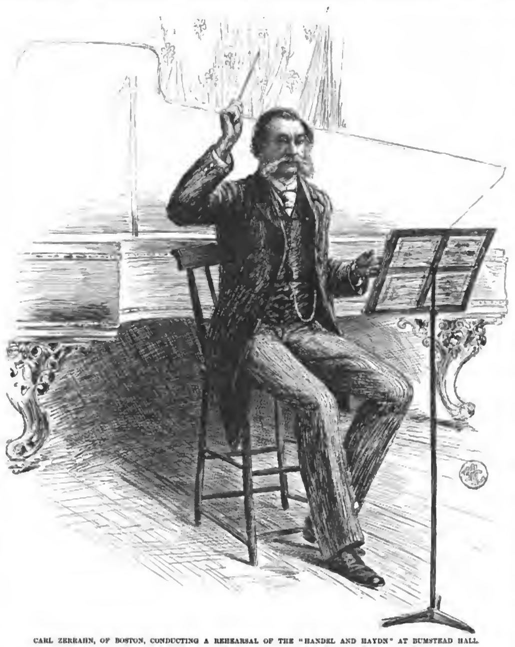
> "Turning again toward childish treble, pipes
> And whistles in his sound."

Such are the gracious ministrations of singing societies; and those who have been under them for any length of time will forever after cherish that sentiment toward music which "passeth understanding," and does a world more good than those kinds of practical knowledge that are commonly looked upon as essential to good social form. I read in my newspaper to-day of thousands of Welsh miners gathering in various towns and villages in Pennsylvania for their annual competition in choir singing; I remember the enthusiasm with which a New York conductor, who had acted as adjudicator at one of these festivals, spoke of the singing of choir after choir composed of miners and factory "hands," and recall the tales I have heard of girls in Pennsylvania mills and factories refreshing themselves while at work by singing the soprano and contralto parts of choruses by Handel and Haydn, hour after hour, without book, and I feel the needlessness of asking whether such facts are or are not a truer evidence of musical culture than the possession of a box at the opera or the ability to twiddle the fingers amazingly over the keyboard of a piano-forte.

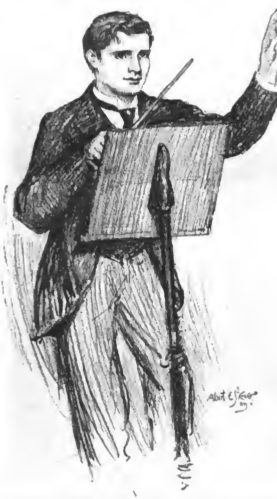
Practically, amateur singing societies are the products of the nineteenth century, and they have flourished as luxuriantly on American soil as any other. Had it not been that the dominant religious spirit of New England and New York in the early colonial days was severely antagonistic to all ornate music, I am inclined to think that the honor of giving them birth would have belonged to this country instead of Germany.

It is said that Handel's *Messiah* was sung in Trinity Church, New York, with organ accompaniment in the year 1770. If the statement be true it is in the highest degree significant and interesting. The oratorio was then less than twenty-eight years old, and I greatly doubt whether it had ever before been sung by choristers who were amateurs in the same sense that the singers of Trinity were amateurs. The choir, I am inclined to believe, was then a volunteer organization chiefly recruited from the boys of the charity school. The statement has also been made, but not substantiated by proofs, that New York possessed choral societies as far back as the middle of the eighteenth century. It would be a feather in the cap of the city if this could be demonstrated, for choral societies, in the sense that we understand the term, were unknown at that time in Europe. Neither Handel nor Bach ever heard his choral works sung by a choir as large as is commanded by any one of five hundred choir-masters in the United States to-day. This is a reflection calculated to illustrate one phase of the tremendous change that has been wrought in musical culture by the introduction of volunteer choruses. In the operas of Handel, his predecessors and contemporaries, a chorus seldom, if ever, meant more than a union of all the solo singers. Bach produced his *Passions* in Leipsic with a dozen choristers, and I doubt whether Handel ever heard fifty voices unite in a performance of his *Messiah*. Even at the great Commemoration of 1784 in Westminster Abbey, which was commemorated by Dr. Burney by the publication of a book, and was the most stupendous choral affair heard of up to that time, the choir numbered only 275 voices. It is therefore scarcely surprising that though there were singing societies in Boston before the Handel and Haydn Society, they left but a slight impression upon the sands of time, and served for little else than to show how strong was the amateur desire to supply the place of the professional organizations which did the choral work for Europe, and to prove the rule of the restrictive force of religious prejudice. Nearly two centuries of musical waste lie between the landing of the Pilgrims and the organization of the Handel and Haydn Society in 1815. Seventy-five years before this date the contest as to the righteousness or wickedness of singing psalm tunes by note was still raging in Boston, and there was no lack of pious persons who believed that the limit of musical enjoyment in divine service was that set by the Puritan Confession of Faith, adopted in 1672, which allowed unisonal, but not concerted, antiphonal, or accompanied singing, this style being described as "tossing the psalms from one side to the other, with the intermingling of organs." Billings, the "American Cyclops," as he was called because of his one eye, a fellow of amazing impudence and energy, but the crudest knowledge and taste in music, from whom descended the tribe of "convention leaders," not yet extinct, did little to improve popular taste, but much to create a liking for choir singing, and must be credited with yeoman service in clearing the way for societies like the notable Handel and Haydn, which threw off the crude old singing-book yoke and found their inspiration and reward in the classics.

In New York the situation was no better so long as the Dutch influence was dominant, and it must be remembered that the social régime of the Dutch outlived the political many years. Between the Puritanism of the New England colonists and the Calvinism of the Dutch and French Huguenot settlers of New York, music had little choice. But when Trinity Church became a social power, an amendment in the popular attitude followed, and, it would appear, very quickly — a fact due, probably, in a measure, to the more mixed character of New York's population, as well as to the artistic trend of the Episcopal service. The spread of choral societies through the sections of country which drew their inspiration from New York and New England was amazingly rapid; how rapid can be illustrated in no better manner than by appeal to the annals of Cincinnati as a representative city of the West. The first white settlement in the territory northwest of the Ohio River was made where Marietta now stands, in 1788, less than one hundred and two years ago. In December of the same year, Cincinnati, or Losantiville, as it was called for a time, was laid out by a party of men from New Jersey. When the nineteenth century opened, the town consisted of a few frame and log houses near a fort, to which a population of about seven hundred and fifty souls looked for protection from the Indians. In 1815 a John McCormick in Cincinnati was already advertising for subscriptions to a book of choral music to be called *The Western Harmonist*, which the author had had in "contemplation for many years," and hoped would "furnish *the different societies* with the most useful tunes and anthems." In the year which saw the birth of the Handel and Haydn Society in Boston, therefore, there were already several singing societies in the brisk little town on the Ohio River. I confess the record staggers me; but everything is surprising in connection with the spread of choral music after the propriety of artistic singing in church had once been established. Four years later, in 1819, the Haydn Society, composed of the best singers of "the different societies" (church choirs, doubtless) to which Mr. McCormick had made appeal, gave a concert, and, besides a number of popular anthems of English composers, sang "The Marvellous Work," from Haydn's *Creation*, an oratorio that had been sung in its entirety for the first time in America only two years before by the Handel and Haydn Society of Boston. All this happened, be it remembered, within a generation of the first settlement in the territory northwest of the Ohio River, and scarcely more



CARL ZERRAHN, OF BOSTON, CONDUCTING A REHEARSAL OF THE "HANDEL AND HAYDN" AT BUMSTEAD HALL.



WALTER DAMROSCH, OF NEW YORK.—"Ladies, B Flat is not B Natural!"

than twenty years after the time when the members of the First Presbyterian Church in Cincinnati (who, however, were not active in the musical movement) were subject to fine, under a rule of the church, if they came to meeting without their rifles ready to resist an Indian attack.

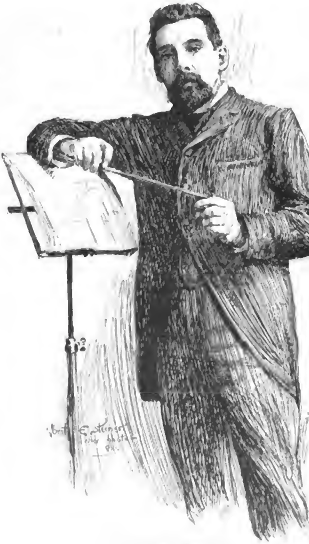
Nearly three generations of Bostonians have been trained to love the choral classics by the venerable Handel and Haydn Society, which came into being in the hall of Gottlieb Graupner, early in 1815. Graupner was a German musician who had played in some of Haydn's concerts in London. He then came to America, living for a time on Prince Edward Island, and in Charleston, S. C., before taking up his abode in Boston. Mr. Laurence Hutton, writing a few months ago in HARPER'S MONTHLY MAGAZINE, discovered him to be the original American negro minstrel, quoting a mention in an old book to the effect that "a Mr. Graupner" had sung "The Gay Negro Boy" in character, accompanying himself on the banjo, at the end of the second act of *Oroonoko*, on December 30, 1799, at the Federal Street Theatre. This record suggests a bit of curious inquiry, and illustrates the pervasiveness of this German musical pioneer's influence. He was the leading piano-forte teacher in Boston eighty years ago, was a professional hautboyist, played the double-bass in the orchestra which took part in the early concerts of the Handel and Haydn Society, was one of the founders of this society, and kept a music shop. Now, as if this were not enough, Mr. Hutton is seeking also to present him in the character of "the father of negro song." It must be confessed that he is not uninteresting even in the light of these honors. He married a musical lady of Charleston, and it was doubtless in that city that he became acquainted with the banjo. He had been a resident of Boston only a year when he is represented as singing "The Gay Negro Boy," and was at the time not only fresh from his observations of slave music, but perhaps also sufficiently in need of money to be willing to try to mend his fortunes by singing negro songs and playing the banjo in public. Mr. Dwight, and all the historians of musical Boston, agree in doing him honor as an influence of great potency in the betterment of the crude taste which came over from the last century.

Two circumstances can be quoted from the early history of the Handel and Haydn Society to accentuate the great change that has been wrought in artistic and social methods within three-quarters of a century. In the first years of the society women played an exceedingly small rôle in its activities. The admission of half a dozen of them in 1817 caused considerable controversy in the councils of the society, and, strange as it may sound to the ears of the choristers and choir-masters of to-day, even after they had been admitted in large numbers, they did not help the artistic effect of the singing. This was not because they had poor voices, but because the custom of distributing the voices as nature designed them to be distributed had not yet gained foothold. In the first oratorio performances in Boston the treble part was sung by boys and men, and the tenor part was given to the women. The use of boys to carry the treble was not novel, but borrowed from European practice (as near as I can make it out from the old records, there were only thirteen women in the 275 choristers of the Handel Commemoration in 1784); but I fancy that tenor women were a New England invention. They survived in the smaller towns and villages until not many decades back. I myself was startled a few years ago by hearing the strange effect in a home in the Naugatuck Valley, where a family party was singing a hymn. The employment of tenor voices to carry the soprano seems to me also a New England phenomenon. The second circumstance will not appear quite so startling to those who remember how universal was the custom of drinking spirits two generations ago. It was part of the duty of the superintendent at the rehearsals of the Handel and Haydn Society, in its early years, to provide liquor for the men in an anteroom. Thither the male members repaired in the intervals of rest to "tune up," as the slang of that day had it.

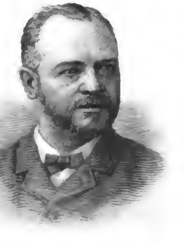
So rapid was the progress of the Handel and Haydn Society, so wise its early administration, that within eight years of its foundation its friends felt it to be strong enough and dignified enough to justify an invitation to Beethoven to compose an original oratorio for it. The evidence is exceedingly meagre in the premises, but there is no doubt that Beethoven seriously considered the proposition for a while (though, I fear, more in the light of a pot-boiler than otherwise), but eventually permitted other work to drive it out of his head. It chanced to come to him at the time when the idea of composing music for Goethe's *Faust*, suggested by Rochlitz, was filling his brain. This project, however, like that of the Boston oratorio, was sacrificed to the Ninth Symphony and the last quartettes. There can be no doubt that much of the progress of the society from the crude ideals and mistaken methods of the early days to the lofty ideals and achievements which it attained within two or three decades after its foundation was due to the influence of German musicians, beginning with Graupner, just as it reached the high-water mark of its efficiency and influence for good under the artistic direction of the German who is still at the post which he accepted in September, 1854. For more than a generation Carl Zerrahn has, by virtue of his position as conductor of the venerable Boston Society, been the most conspicuous chorus leader in America. He came here as flautist of the Germania Orchestra, which, under Carl Bergmann, made a tour of the country in the early thirties. When the orchestra disbanded, Bergmann recommended him as conductor to the Handel and Haydn Society, and that office he has filled ever since. At its concerts, and the festivals given annually in Worcester and other New England towns, as well as in Petersburg, Virginia (where the enthusiasm and energy of a German merchant and musical amateur are developing a beautiful activity in choral culture), his tall and martial figure, firm beat, and inspiriting word of command have often stimulated his forces to an enthusiastic charge up the choral hill to a sonorous climax, or indicated a gentle descent down to the plain where lie the tents of a restful and refreshing closing cadence. Mr. Zerrahn was born in Malchow, grand duchy of Mecklenburg-Schwerin, on July 28, 1826.

In the West, some of the finest achievements in choral song have been due directly to the influence of the Germans, but this is not true of New York, except so far as that influence has come from professional musicians. The Oratorio Society, which must be ranked high among organizations of its kind the world over, was called into existence by Dr. Damrosch, a German (or, to be exact, a Germanized Hebrew), who, moreover, had been brought to America by the Männergesangverein Arion, a distinctively German organization; but it is only a manifestation of a spirit that has existed in the city ever since the early years of the century, and that has had more incarnations than Vishnu. Its immediate predecessors were the Church Music Association (which died of too much aristocracy, and a tendency imported from England, through one of its conductors, Charles E. Horsley, to give the lie to its name by singing scenes from operas), the Mendelssohn Union, and the Harmonic Society. I mention only these three as being all within the recollection of the present generation. From the Harmonic Society the Oratorio Society accepted the beautiful mission of giving a performance of *The Messiah* every year, in Christmas week. But though the Oratorio Society now embraces the elements (or their natural successors) of the societies which preceded it, it is almost unique in its genesis. It was not created by a schism, as such choirs usually are, but was developed originally from a small party of Dr. Damrosch's friends who met in his house in the spring of 1873. Only fifteen or eighteen persons took part in its first study meeting, but they were earnest music lovers, and an influence which has lived in this department of musical culture for over a century—the influence of Trinity Church or its parishes—soon enlisted elements which brought it to public notice. Dr. Damrosch's beautiful zeal and intelligent administration of the artistic affairs of the society cared for the rest, and when he died, in February, 1885, the society was perhaps more firmly grounded than any of its predecessors had ever been. In its twelve years of existence it had produced Bach's mighty *Passion*, according to St. Matthew; Berlioz's *Messe des Morts*, Brahms's *German Requiem*, Handel's *Messiah, Judas Maccabæus, Alexander's Feast, L'Allegro*, etc., and *Israel in Egypt;* Haydn's *Creation* and *Seasons;* Mendelssohn's *St. Paul* and *Elijah;* Rubinstein's *Tower of Babel*, and Schumann's *Paradise and the Peri*, besides two cantatas composed by Dr. Damrosch, and a large number of smaller works and parts of works. No feature of a conductor's work exacts so many qualities as the training of a choral society. The work of the singers is voluntary and wearisome; upon the conductor devolves the duty of keeping up their interest while putting them through weeks and months of drudgery. This is impossible unless the leader be a man of complete devotion to his art, of broad human sympathies, liberal tastes, and one with the ability to enforce discipline and sway the minds as well as the emotions of the singers. All these qualities Dr. Damrosch possessed in a marked degree. He knew well how to impart the love he felt for the masterpieces of musical art to those whom he was training. It was his habit to interlard technical instruction with expositions of the contents of the work under study. When the music was of a kind which appealed powerfully to his musical sensibilities, it was not at all infrequent that he worked himself into a state of great emotional exaltation, which communicated itself to the singers and made them forget all about the physical weariness produced by study and practice. There was an affectionate feeling between him and his singers, to which, unquestionably, the rapid growth of the Oratorio Society in numbers and efficiency was greatly due. His mantle fell upon the shoulders of his son Walter, who had associated himself with his father in the artistic work of the Oratorio Society in 1877, when he became accompanist. There has been much that is factitious, and adventitious also, in the rapid advance which young Mr. Damrosch has made to one of the most influential and significant positions in the country; and careful observation of his work, from its beginning down to the present moment, has compelled me to believe that in his case what might be is better, truer, more beautiful, and more pregnant with honor than what is; but it is a pleasure to bear witness to so brilliant a demonstration of capacity as a chorus leader as he gave last season, when the Oratorio Society performed Eduard Grell's unaccompanied mass in sixteen parts; and, further, to record the fact that the society has lost nothing in strength of organization or popularity during the five years that he has been at its head.

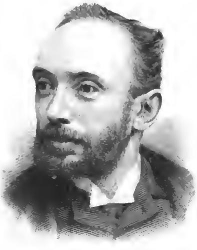
In New York the German influence, which I



W. L. TOMLINS, OF CHICAGO.



JOSEPH MOSENTHAL, OF NEW YORK.



WILLIAM R. CHAPMAN, OF NEW YORK.

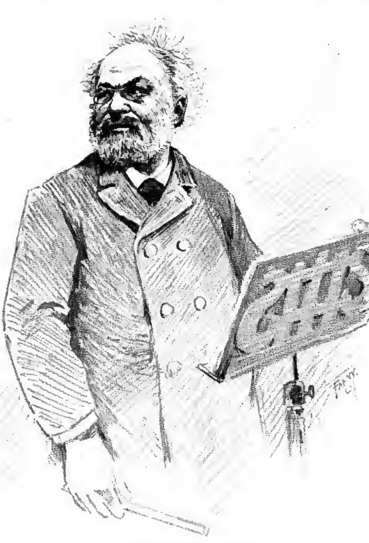
have mentioned as being peculiarly potent in some of the phases of choral culture in the West, has borne fruit of a pleasant kind by encouraging the cultivation of part-songs for men's voices. Organizations like the Mendelssohn Club exist in nearly all the large cities of the country, but I know none that compares in performance with the Mendelssohn Club. Except in the matter of virility and dramatic forcefulness, when those qualities are demanded by the music, the club's singing is as perfect as any one can ever expect to hear. For this much credit is due to Mr. Joseph Mosenthal, who has been its leader for many years. Considerations of health have taken him abroad, but he is still nominally the conductor of the club, and his methods of training are perpetuated by Mr. Arthur Woodruff, who is leading the club this year. Mr. Mosenthal, for a full generation, was a highly influential organist of the Episcopal Church in New York, but resigned from Calvary Church rather than yield to the fashionable craze for boy choirs, a craze which, I may be permitted to say in passing, is working great injury to the artistic quality of the musical services in the American metropolis and, I doubt not, elsewhere. He is also a violinist, and came to New York from Cassel, where he was a pupil of Spohr, and his name will always be associated with the names of Theodore Thomas, William Mason, and Frederick Bergner in the history of chamber music in America. The existence of such clubs as the Mendelssohn, and its most formidable rival, the Apollo of Brooklyn, is due directly to the love for male chorus music introduced into America by the Germans. The attachment of the German to the institutions of his father-land is exemplified more forcibly in the Männerchöre and Liedertafel, to be found wherever there is a considerable community of citizens of German birth, than in anything else. In New York the sentiment has given two of the most prosperous social clubs of which the city boasts (the Liederkranz and the Männergesangverein Arion); but these clubs differ from the ordinary social club of America in that their purpose is not only to promote the congeniality and good-fellowship which the German loves, in a manner which does not preclude the participation of his wife and children, but also to cultivate the art to which as a people the Germans are most devoted. Both of the clubs mentioned support choruses—the Liederkranz one of mixed voices, conducted by Mr. Reinhold L. Herman; the Arion one of men's voices, conducted by Mr. Frank Van der Stucken. Since 1849, when the first festival of German singers was held in Cincinnati, a Sängerfest has been held in some city of the Union nearly every year.

The North American Sängerbund aims to hold a festival biennially. Popular interest has died out in these great gatherings to some extent, but festivals have been held in which as many as 3000 singers participated. Candor compels the confession that at most of these festivals the worship of Gambrinus was more industriously cultivated than the worship of Apollo, but they have, nevertheless, done great service in spreading musical culture throughout the country. Indirectly Cincinnati, where the German festivals started, and which now enjoys the reputation of being pre-eminently the festival city of America, through the merit of her great biennial music festivals, established by Theodore Thomas in 1873, owes her Music Hall, Festival Association, Exposition Buildings, College of Music, and Art Museum to the influence of the German Sängerfests. A hall built for one of the Sangerfests proved to be so useful a structure that it was preserved. The Expositions were called into being to occupy the hall. Then Mr. Thomas developed the festival idea, and after two festivals had been given, with great success, the public spirit of Cincinnati's citizens brought forth the fine fruit of the permanent buildings which are now one of the chief ornaments of the city. And so the good work went on. Originally the festivals (of which the ninth will be held next May) relied for their chorus on the co-operation of the various singing societies of the city and adjacent country, but very soon a permanent choral organization was formed, and ever since, this organization, which numbers about 500 voices, has been the festival choir. It was the May festival that brought Mr. Otto Singer to Cincinnati. He had come to New York in 1869 on the recommendation of Liszt, to take a position in the Conservatory of Music projected by Theodore Thomas and William Mason, and when that educational enterprise was abandoned in 1873, Mr. Thomas sent him to Cincinnati to train the festival chorus. In New York he was the accompanist and assistant of Mr. Thomas in the conduct of the Mendelssohn Union, which is no longer in existence. His activities in the choral line since 1880 have been devoted chiefly to some of the German societies of Cincinnati. Mr. Singer is a native of Saxony, was born in 1833, and was a pupil at the Leipsic Conservatory from 1851 to 1854. He is a radical of radicals in his musical creed, and has labored hard to advance the Liszt cult in America. The choral successes of the Cincinnati festivals of 1882, 1884, and 1886 were largely due to the zeal and capacity of Mr. Arthur Mees, who has, since the year last mentioned, found a congenial and profitable field for his labors in New York. Mr. Louis Ehrgott, a young musician native to Cincinnati, is now the trainer of the chorus.

The Cincinnati festivals have been productive of much good in encouraging the giving of festivals and elevating the standard of choral work throughout the country. In some notable instances the influence of the festivals was transmitted directly through persons concerned in the affairs. Thus the most ambitious of Philadelphia's choral efforts for many years have been due to Cincinnati's example and the practical encouragement extended by the Cincinnati Association to one of Philadelphia's musicians. In 1881 the Cincinnati Festival Association offered a prize of $1000 for the best choral work by an American composer. The prize was awarded to Mr. W. W. Gilchrist, teacher, organist, conductor, and composer, of Philadelphia, for his "Forty-sixth Psalm." In May, 1882, Mr. Gilchrist heard his music performed, and, as may be imagined, returned to his Eastern home full of enthusiastic purposes. He was at the time conductor of the West Philadelphia Choral Society, Amphion Society of Germantown, and a small society called The Arcadian. At his suggestion these three societies organized the Philadelphia Music Festival Association, which gave two festivals in the Academy of Music in 1883 and 1884, under the leadership of Mr. Gilchrist and Mr. Charles M. Schmitz, with a chorus of 550 voices. In organizing this chorus, a Cincinnati experience was repeated. It cost the life of the societies that had called it into existence; but though financial failure compelled the abandonment of festival-giving, the choir survives in the Philadelphia Chorus, whose concerts are highly creditable to the city, as well as to the society. At the performance of *The Messiah*, under the direction of Mr. Gilchrist, on December 20th, the choir, reinforced for the occasion, numbered 600 voices, and its performance was described as the best ever heard in Philadelphia. Mr. Gilchrist was born in Jersey City, in January, 1846; he is wholly American in education, and has devoted himself exclusively to music since he was twenty years old. He conducts, in addition to the Philadelphia Chorus, the Mendelssohn Club, the Germantown Choral Society, and the Tuesday Club of Wilmington, whose singers united with the Philadelphia Chorus in this year's Christmas-tide performance of *The Messiah*. The musical life of Philadelphia contains one feature which is very suggestive of food for reflection. This is the choir of children in the Gethsemane Baptist Church. This unique organization furnishes a solution of the question which confronts choir masters in some communities: "How shall the choir be recruited?" It was organized fifteen or twenty years ago under the pastorate of the Rev. L. P. Hornberger, now dead, at whose request it was called "The Pastor's Choir." As many as two hundred children are taught the rudiments of singing and music in this choir by Mr. Henry J. Keely, and from it not only the choir proper of the church, but many other musical organizations have been recruited. It occupies a gallery of its own in the church during service, and contributes greatly to its artistic beauty and devotional impressiveness. It is a profound pity that the sound principle underlying this organization has not more general recognition in the churches. If it had, much greater praise would be challenged by the worship music of New York than can be given it under existing circumstances.

As a matter of fact, the instances in which music sung in the churches can be called worship music even by courtesy are few. The Episcopal churches are eaten up by the rage for surpliced choirs, which are increasing in number and decreasing in efficiency with every year. The fact that they please the eye is supposed to make amends for their frequent assaults on the ear. There are quite a number of the churches of other denominations which employ choruses, but the rule is still the solo quartette, and really efficient chorus choirs of mixed voices (which stand for the highest and best things in this department of art) are comparatively few, and are maintained with great difficulty. How to keep up the interest of volunteer singers in work which does not hold out even the little reward to be found in the exciting incidents of a public concert is the great problem confronting choir masters. Wealthy churches do fairly well by hiring the singers, but I fancy that if it were generally known how much interest might be aroused by the arrangement of choir lofts so as to admit of effective antiphonal services (as in the case of the Gethsemane Church), and the cultivation of such services, the result might be very considerably to stimulate interest in worship music.

Social considerations play a great rôle in choral culture, and cannot be overlooked even by the most zealous devotee of pure art. Among the most notable examples of what can be done by appeal to the feeling of exclusiveness and the promise of social brilliancy in connection with choir singing which the history of music in America can boast, stand two of the societies in New York which are directed by Mr. William R. Chapman. These are the Rubinstein Club, devoted exclusively to part-songs for women's voices, and the Metropolitan Musical Society, a mixed choir. The concerts of these two organizations, which are yet new, excite predominantly a social interest. Full-dress in the concert-room, admission



OTTO SINGER, OF CINCINNATI.

only to subscribers, and the disposition of the singers on a stage transformed into a bower of beauty by the florist's skill are in the mind of their patrons the distinguished characteristics of the concerts of these societies. They ought not to be so, in view of the loveliness and significance which the performances have in a great degree, and might have in a greater; but if the social prop were pulled away, the artistic edifice would probably fall, for the simple reason that the members of the choirs are largely professional concert and church singers. Of course they must be treated with the greatest delicacy, and the patrons having other than artistic objects in view, programmes must be arranged to meet their tastes instead of to promote high ideals. There is only one choir that I have ever listened to that produces a body of tone equal in quality to that of the Metropolitan Musical Society, and that is the Apollo Club of Chicago, directed by William L. Tomlins.

The artistic aims of Mr. Tomlins and his singers, however, are loftier than those of the New York organization, and their work must be accounted of greater significance by the student of musical progress. Such a statement is in the nature of a confession, from a New York point of view, and its grievousness is intensified by a knowledge of the fact that the literature of choral music, from the old Netherland contrapuntists to the composers of to-day, sets no task which the Metropolitan Musical Society might not perform with much credit to itself and great good to the art.

It is manifestly impossible to refer to all the societies in the country that are laboring intelligently and earnestly to promote love for choral music, but I should be sorry to end even a fragmentary record without mention of the Boylston Club of Boston, conducted by George L. Osgood; the Apollo Club and Cecilia of the same city, under the bâton of B. J. Lang; the Oratorio Society of Baltimore (conductor, Fritz Finke), the Amphion and Choral Society of Brooklyn (C. Mortimer Wiske), the Apollo Club and College Choir of Cincinnati (B. W. Foley), the Cleveland (Ohio) Vocal Society (Alfred Arthur), the Philharmonic Society of Montreal (G. Couture), the Mendelssohn Union of Orange (Arthur Mees), the Mozart Club of Pittsburgh (J. P. McCollum), the Arion Club of Providence (Jules Jordan), the Loring Club of San Francisco (D. W. Loring), the St. Louis Choral Society (Joseph Otten), and the Toronto Philharmonic Society (F. H. Torrington, who likewise conducts the efficient chorus choir of the Metropolitan Methodist Church of Toronto).

AN ADMIRABLE TREATY.

THE new treaty with Great Britain, extending the provisions of the treaty of 1842 to include many other offences, is an act of international comity which will receive universal approval. It has long been discreditable to both countries that Canada, separated from us at many points only by an invisible line, should be a retreat for rogues and thieves, who quietly stepped over the line, and laughed at our impotence to reclaim and punish them. As Mr. BLAINE says, in the letter accompanying the treaty, "crimes among the most dangerous to social order have been committed with impunity," owing to the complete security of an easy retreat to Canada. The treaty remedies this situation, which ought not to exist as between two friendly civilized states, and which, in fact, does not exist in our relations with other powers than Great Britain. The principle of the treaty is extradition for common crimes which are punishable by the laws of civilized states, "and not such as are made penal in any particular country by reason of peculiar conditions there existing."

The treaty carefully excludes from its provisions extradition for political offences, or when it is shown that whatever the pretence of the requisition, it really seeks a political offender; and the treaty provides that if a question should arise under this article, it shall be decided without appeal by the power within whose jurisdiction the fugitive shall be. This is an excellent, simple, and conclusive provision. It authorizes each power to judge for itself what constitutes a political offence, and it secures the right of asylum, by which free countries properly check the excesses of arbitrary power in countries beyond their jurisdiction. The good sense and justice of the treaty are illustrative of the character of the two powers by whose representatives it has been concluded. Ratification by the Senate may be assumed, although a good foreign convention is so great an advantage for the party of the administration which effects it that some ingenious party sparring may be perhaps fairly expected. The point upon which, if possible, some political gain would be sought is, of course, the article referring to the surrender of political offenders. But this is so well guarded by an old party hand that no successful assault can be made upon it. The article is an admirable statement of the American doctrine upon the subject. In making a treaty with Great Britain every American statesman has in mind the Irish vote, and no Democratic Senator is likely to be more mindful of it than the Republican Secretary of State.

There is always satisfaction in contemplating international acts which are, what they ought to be, frank and simple, and without ulterior aims. The two great powers in the world which for the highest reasons ought to be in friendly accord are the United States and Great Britain. This is a truth which is as evident as the other, that the traditional distrust of the mother country has played a great part in our politics, and to this distrust has been added of late years the American desire to propitiate the Irish vote, a purpose which has produced some pitiable results. There is really, as every well-informed observer knows, the heartiest sympathy between the best intelligence of both countries, and he is not a friend of either who does not seek in every honorable way to strengthen and extend that sympathy, and who does not scorn to make a foreign jealousy affect purely domestic polities.

DOM PEDRO AS A PATRIOT.

THERE was never a more remarkable spectacle of the kind than the relation of DOM PEDRO of Brazil to the revolution in that country. One of our poets addresses one of his friends as "the civil time's sole patriot," and the old Emperor's feeling for Brazil is not surpassed in fidelity and tenderness by that of any of the revolutionary leaders. He is reported to have said at Cannes to an Associated Press reporter that the revolution would be probably permanent unless there should be an attempted dictatorship. But even an unpopular sovereign, said the old monarch, ruefully, is preferable to a dictator. He added that he had tried to give the Brazilians a good government. Attributing without hesitation the revolutionary movement to emancipation, DOM PEDRO said that his support of the emancipation act undoubtedly made enemies for the crown and divided his cabinet. The slavery members resigned when he signed the bill, and many of their friends joined the Republicans merely as an opposition and as a means of exciting discontent. To avert trouble, he proposed to grant the larger part of the Republican demands, and even to form a Republican cabinet, in which he offered a seat to General DE FONSECA. When the Republicans declined co-operation, he offered to submit the question of a change of government to the people, promising to yield to the popular wish. The reply was that which always comes to such a royal proposition at such a moment—"Too late."

The ex-Emperor said that he had no thought of abdicating, but that if he should be elected President, he would gladly return. Indeed, he would return eagerly, whether as Emperor, President, or private citizen. It is all very touching, and it is certainly unprecedented. It explains also the universal kindly feeling for DOM PEDRO in Brazil. At no time has there been any sign of personal hostility. Yet the monarch against whose rule a revolution rises is generally regarded as the representation and embodiment of the wrongs which the revolution seeks to right. It is probably true that the curious situation in Brazil is symbolical of that in a greater or less degree in every civilized monarchy. The French Revolution destroyed the regal tradition, and really established in the public mind of monarchical countries the doctrine of the revolution of 1688 in England—of a contract between King and People. The kind of fight which CHARLES I. made for his crown will hardly be made again in enlightened countries, because the revolution will take place in public opinion before it proceeds to action.

It is probably the general conviction that if the British form of government should be changed, it would be accomplished virtually by consent rather than by armed force. Public opinion governs in England as much as in the United States, and the crown or monarchy, as such, cannot infringe upon popular liberties. DOM PEDRO in Brazil evidently regarded himself as a royal tenant at will, and that is becoming the conviction of monarchs in general. In Prussia the regal tradition is imposing and strong. But its strength lies in no glamour or fiction of monarchy, but in the deep conviction that monarchy is most expedient in the actual situation. In Italy the real sentiment of the country undoubtedly prevails in the government, and the King would retire in an actual exigency as LOUIS PHILIPPE retired from France in 1848. There could be nothing more characteristically modern than DOM PEDRO'S pathetic remark that he would gladly return to Brazil as Emperor or President or private citizen.

A GOOD WORD FROM NEW JERSEY.

THE old phrase "the United States and the Jerseys" was a sarcastic fling at our excellent neighbor beyond the Hudson. Still later the sobriquet "the State of Camden and Amboy" was not suggestive of a high conception of our neighbor; and even Mr. EMERSON, in one of his essays, unconsciously testifies to a familiar sentiment in saying that "the Jerseys were good enough for the feet of WASHINGTON." It is not to New Jersey that the country has always looked for progressive leadership, and it was therefore with unusual surprise and pleasure that Governor ABBETT'S strong plea for ballot reform was received, and that we hear of a bill preparing to introduce civil service reform into the municipal government of the State. Governor ABBETT'S argument is the more significant because he is a Democrat who is supposed to cherish certain ambitions or hopes, and his strong advocacy of the reform must be regarded as proof of his conviction that it is not a whim, but a settled and growing purpose of the people. It is also another interesting sign of the contest in the Democratic party between progressive and reactionary tendencies.

This is a contest which every good citizen should hail with pleasure and watch with great interest. If some day we should find ourselves in that millennial condition in which we should have to decide not which party is, upon the whole, least venal and mischievous, but which is more truly honest and progressive, there would be general bewilderment. If he may decide by the representations of the ever faithful press, the perplexed citizen is now asked at an election to express by his vote his preference between a government of rebel brigadiers and one of floaters in blocks of five. On the one hand he is assured that the word Democrat signifies treason and ruin, and on the other that the word Republican means corruption and destruction. His mental confusion is not relieved by seeing in one State a Democratic Governor denouncing a reform as fatal to the rights of the people, and in the next State a Democratic Governor extolling it as the hope of a free republic. The worthy citizen regains his mental equilibrium only by perceiving that he must look beyond a party name, and govern his action partywise by evident party tendencies. For it is plain that party names do not describe the views of party adherents upon some of the most pressing public questions of the time. Mr. BUTTERWORTH declares that he is rather a Republican *enragé*, but he advocates free-trade or reciprocity with Canada. Civil Service Commissioner THOMPSON is an unquestionable Democrat, but he is an uncompromising friend of civil service reform.

Such facts show that certain measures are so good in themselves, or are believed to be so popularly approved, that they command the support of men in all parties, while the opposition of other men, in whatever party, is a distinct advantage. It was a very wise as well as worthy remark, "We love him for the enemies he has made." It is perhaps as severe a thing as could be said of General BUTLER that his hostility to a measure commends it strongly to intelligent and patriotic men as wise and desirable. The sneers of Corporal TANNER at any project of reform are tributes to its excellence. But Governor ABBETT'S support of ballot reform shows its stronger hold both upon the country and his party. His approval, and that of the other newly elected Democratic Governor, CAMPBELL, of Ohio, make it impossible longer to say that the position of Governor HILL proves the party to be hostile to ballot reform. This is a matter of congratulation for the country, because it shows that the patriotic desire for honest government is not confined to any party.

THE QUESTION OF SAMOA.

THE treaty for the adjustment of the Samoan question has been published, and it confirms the statement made last summer, when it was negotiated, that, however excellent in certain ways, it provides for an entangling alliance of the United States with foreign powers. That our interest in the Samoan Islands is slight and unimportant is shown by the fact that although by a grant from the natives in 1878 we acquired a right to a harbor and a coaling station, we have never thought it worth while to avail ourselves of the grant and establish ourselves there, and when some months ago we were said to be in a dispute about our rights in Samoa, there was a general inquiry where is Samoa, and what rights have we there which can endanger our relations with Germany? Nevertheless, a case was admitted by our government and a settlement attempted under the late administration, which failed, and the first success of the HARRISON administration was the Berlin treaty, by which we agree with Germany and England to govern the Samoan Islands—apparently to prevent Germany from governing them alone. The treaty is well drawn for its purpose. It settles certain disputes about land. It saves, probably, an immense diplomatic correspondence over quarrels that were sure to arise between the three powers that have been claiming rights upon the islands. Perhaps it saves actual trouble with Germany; and the real Samoan question for us may be considered to be an alternative—an alliance with Germany, or a war about a very unimportant interest. But why have we put ourselves in such a position?

The treaty effects an alliance by which England, Germany, and the United States practically take possession of the government of Samoa, as Russia, Germany, and Austria took actual possession of Poland. In case of difference of opinion, we agree to acquiesce in the decision of the majority of the three powers. The German press admits that the treaty prevents German dominance, and complains of it because two-thirds of the foreigners in Samoa are Germans, and four-fifths of the trade, both foreign and domestic, are in German hands. The pretence of a native King and of Samoan independence is transparent and futile. The very first words of the treaty are a declaration of the neutrality of the islands, and of the equal rights on them of the citizens or subjects of the three powers in residence, trade, and protection. These are declarations in regard to a country which can be made only by its government, which in Samoa is described as independent. But this independence is secured by a Chief Justice to be named by the three powers, and removed by a majority of them. The situation is simple and intelligible, and, we repeat, the treaty may be the wisest practicable solution of the situation. But it has not been shown why, under the grant of a harbor and a coaling station, we did not proceed to take the necessary steps, and hold any power responsible that interfered, nor has it been shown why we could not protect American citizens in Samoa precisely as we protect them elsewhere, without an abandonment of our ancient policy of avoiding just such a foreign alliance as is made by the treaty.

By what right have Germany, England, and the United States practically taken possession of the Samoan Islands? Nobody supposes or says that the people of the islands, or their King, or his government, will be permitted to do anything that the three powers do not approve, or that any other power can enter into important relations with the islands without the consent of the three. The question recurs, therefore, whether any advantage gained by us compensates for a course so unprecedented in our diplomacy. The treaty probably will be ratified as an administration measure. Should it be rejected, the rejection would be an abandonment of further negotiation. Germany would resume its predominance in Samoa. The alleged German treatment of American citizens would lead to sharp questions. Sharp questions are the beginning of international trouble. Is not the treaty preferable? This is the argument. But it does not answer the questions how much more foreign alliance must we make to protect American trade and citizens elsewhere, and does the advantage of joining Germany and England in governing Samoa compensate for abandoning our traditional and wise policy of avoiding entangling foreign alliances?

AROUND THE WORLD IN SEVENTY-THREE DAYS.

PERHAPS it is the friendly desire of all esteemed contemporaries not to poach upon the manors of their neighbors which has confined the story of Miss Nelly Bly's trip around the world mainly to the columns of the *World*. The immediate contemporaries of that journal have not encroached upon its prerogative of an exclusive bulletin of a really interesting incident. On the 14th of November she left New York to go alone around the world in seventy-five days, and on the 25th of January she arrived in New York, having accomplished the feat in less than seventy-three days. The journey was made by the usual means, and all connections were made, and only ten days in all lost at three ports for steamer conveyance, the traveller arriving usually ahead of time.

The journey was planned with great intelligence, for the itinerary was made with such skill that every point was reached in time. The traveller has been well throughout her trip, and a woman has gone alone around the world without insult and with universal good-will. *Cui bono?* Well, the *World* has again illustrated its liberal enterprise, which is a good investment for it; the rapidity with which the journey can be made has been demonstrated, showing how well organized the means of communication in every part of the world now are, and, *pace* EDWARD FITZGERALD, a woman has made the fastest trip around the world.

It is, above all, a signal illustration of an art wholly modern—the art of advertisement. The motive of the expedition was none of the apparent motives. It was that of the expedition for the discovery of LIVINGSTONE, and of various other noted enterprises. It was to publish and benefit other and wholly unrelated enterprises. This result of the immense competition and individual resources in modern society has been treated by Mr. HOWELLS in his recent *Hazard of New Fortunes* in a character which is a creation, who carries into advertising the fervor of the artist—"into paint will I grind thee, my bride!" Advertising is a modern art which has had no more striking illustration than the trip of Miss Nelly Bly.

A RECENT DROLL INCIDENT.

WHEN the old Council of Revision was abolished in New York, if the Convention could have had a glimpse in the future of a bill involving an enormous expenditure and constitutional doubts, privately completed at the last moment, and without public knowledge or discussion of any kind sent up by railroad speed to Albany in the evening, introduced into the Legislature the next morning, and its immediate passage demanded without reference or deliberation, under penalty of denunciation of the Legislature as hostile to the honor and interests of the State—the Convention would doubtless have said, "Perhaps the Council of Revision had better wait a little."

There was something comical in the evident effort to blow such a measure through the Legislature by a kind of whirlwind. The World's Fair doubtless should be held in New York, and the law was probably a good one. But in order to have the Fair, it is not necessary to trample under foot every safeguard with which the traditions and practices of liberty have surrounded legislation. There is no time to spare if the Fair is to be held in 1892. But might it not better be postponed to 1893 than to pass laws of the highest importance without knowing what they are? Sundry excellent gentlemen, who are especially interested in the Fair provided it be held in New York, were said to think the bill all right. That was good; but they were not members of the Legislature, and they had no responsibility.

No ill was meant, of course, and no improper legislation, but certainly there was never a droller performance for fully grown and intelligent citizens of a republican state than the attempted "rushing" of the bill. Suppose the scheme had succeeded, and the Governor had signed the bill on the day on which it was introduced. A bill of the highest importance would have become law, and neither the Legislature nor the public would have known what it was. New York might have got her whistle, but upon such terms she would have paid pretty dearly for it.

A NEW BROOM.

IT is often true metaphorically that a man achieves great distinction by shovelling away a great deal of dirt. Great reforms, for instance, consist in the removal of heaps of the rubbish of abuse. But it is not often that the opportunity of a most desirable reputation is opened to a man by simply cleaning the streets; doing, in fact, upon a great scale what little boys with brooms do for a penny at muddy street crossings. This, however, is the opportunity offered to Mr. LOOMIS, who has just been appointed Street Commissioner in New York. Should he clean the streets and keep them clean, he will be covered with the hearty benedictions of a long-suffering people.

He has been already reminded by the vigilant press that lasting reforms, that is to say, streets permanently clean, depend very much upon the character of the persons whom he calls in to assist him, and if he will insist upon appointing only fit agents his fame will be justly great. The vigilant press doubtless remembers the exhortation of the bystanders to the small boy in the fight, to "go in and win." The real question is not of the Commissioner's desire or purpose. It is universally agreed that he has the necessary qualities for the efficient discharge of his duties. But is he a free agent? Can any officer in his position be a free agent?

If he resolutely devotes himself to his work, solely intent upon doing it as it ought to be done and as he can do it, he must, first of all, refuse to appoint assistants because politicians want them appointed, and select them solely because they are the best men. How far does a vigilant press think that a Street Commissioner appointed by Tammany Hall would advance upon that road without challenge and arrest? If Mr. LOOMIS should justify the high praise and expectation with which he enters upon his duties, it will very probably be done by demonstrating that the conditions imposed upon a Commissioner, and which he cannot help, make clean streets economically impossible.

WOMEN PHYSICIANS FOR INSANE WOMEN.

THE proposition which is pressed with great vigor by the Woman's Educational and Industrial Union of Buffalo, that in every hospital and asylum under State control in this State there should be at least one educated woman physician, is so essentially reasonable and so justified by experience that it is impossible to see upon what ground it could be opposed. Legislative action upon the subject has been taken in Massachusetts, Pennsylvania, and Ohio. In ten other States—Maine, Michigan, Minnesota, Indiana, Illinois, Iowa, Nebraska, New York, California, and West Virginia—women physicians have been voluntarily appointed by superintendents or trustees. There are now more than twenty such physicians serving in State institutions.

New York legally sanctions the education and practice of women physicians. Is there any good reason why she should not provide by law that every unfortunate insane woman under the care of the State shall have the services of an expert of her own sex if she desires it? Surely the question carries its own answer. It would be thought a very hard dispensation that insane men should not be attended by men physicians if they so desired. The reasons in the case of both sexes are obvious and familiar. The only regret and wonder are that a provision so humane and natural and consoling for these unfortunate wards of the State has not yet been made law.

AN OBVIOUS QUESTION.

UNTIL recently it was the universal practice, upon a change of party administration, to change all postmasters and other public employés, substituting partisans of the new administration for partisans of the old. For reasons which we have often stated this seems to us an extravagant, demoralizing, and dangerous practice, and public opinion is unquestionably rapidly reaching the same conclusion. But public officers who honestly think otherwise, and hold that under a Republican administration postmasters who are Democrats ought to be replaced by those who are Republicans, should certainly have the courage of their opinions. This is the truth which the President, when he was a Senator, frankly urged upon the Democratic administration. He said to President CLEVELAND in effect, "If you wish to remove a postmaster because he is a Republican, do so frankly; but don't say it is because he is a poor postmaster."

Yet what has the President's own Post-office Department been doing? Instead of saying to Mr. BAILEY, the postmaster at Utica, "You are a good postmaster but a Democrat, and therefore you must go," as, very possibly, the case being reversed, Mr. BAILEY might say to the Postmaster-General, it has sent an inspector, a man who was dismissed from the department by the Republican Postmaster-General HOWE, on the demand of the Republican Attorney-General BREWSTER, in connection with the Star Route cases, and upon his report, Mr. BAILEY, who knew nothing of the investigation aiming at his removal, was summoned to Washington, confronted with the kind of scandal which can be always collected from designing vagabonds in and around every public office, and was told that upon such grounds, although he was not allowed to see any of the papers, nor to know the names of the signers of affidavits, this inspector recommended him for removal for gross neglect of duty.

We understand that by common consent the postal service in Utica was never more satisfactory or in higher esteem than it is now. But Mr. BAILEY, although a Democrat and an editor, has fought resolutely "the ring" that in Utica controls both parties. He opposed the Democratic candidate for Mayor last spring because he thought him unfit, and in the autumn he aided in the defeat of the Republican candidate for District Attorney, who was sustained by the ring, and was the only Republican candidate who was defeated. This defeated candidate was the close comrade of the inspector during the investigation in Utica, and the pretence that the postmaster's removal is sought because of inefficiency and neglect is refuted by public feeling in regard to the office. Why does not the department recall the substance of Senator HARRISON's remark to President CLEVELAND, and holding that the postmaster at Utica ought to be a Republican, remove Mr. BAILEY openly because he is a Democrat? That is what Mr. PHILIP HONE did when he became Naval Officer in New York fifty years ago. He was a Whig gentleman of the old school, who regretted the painful duty of discharging Democrats, but did not pretend that it was for any other reason, although he deeply sympathized with the victims, like the walrus with the oyster.

PERSONAL.

THE oldest flag-officer on the active list of the British navy is Admiral Sir PROVO WILLIAM PARRY WALLIS, whose age is nearly ninety-nine. He is also probably the oldest naval officer now in the service of any country. Although he did not actually go to sea till 1804, according to the custom of those times his name was borne upon the books of various war ships while he was still in the nursery, and he has therefore belonged to the navy for ninety-four years. Young WALLIS was a second lieutenant on the *Shannon* when she fought and captured the *Chesapeake*, off Boston, in 1813, and as the captain was wounded, and the first lieutenant killed, he took charge of both ships, and carried them into Halifax.

—HENRY M. STANLEY established a reputation as a disciplinarian when a school-boy at St. Asaph, England. He was then known as JOHN ROWLANDS—the name he kept till he was adopted by a gentleman and brought to this country. The master of the Union school of St. Asaph sometimes put young ROWLANDS in charge of the other boys when he wished to be absent, and the youthful pedagogue always preserved the best of order, soundly thrashing any lad who dared to dispute his authority. As a scholar, ROWLANDS ranked high in arithmetic and geography, his fondness for the latter study being especially marked.

—Rev. Dr. ROBERT PHELPS, Master of Sidney Sussex College, of Cambridge, England, since 1843, and senior of the heads of houses in the university, has just died, at the age of eighty-one.

—Sir WILLIAM GULL, M.D., to whose medical skill the recovery of the Prince of Wales from typhoid fever in 1871 was largely attributed, has recently died in London. He was made a Baronet by the grateful Queen in 1872, and became the best-known physician in England. Many medical and other learned societies counted him a member, and he was a leading authority on brain troubles.

—Over fifty-five years ago PRUDENCE CRANDALL was violently persecuted for starting a boarding-school for colored girls at Canterbury, Connecticut, but not till the State Legislature had prohibited her school, and she had been tried, convicted, and imprisoned for breaking the law, did she give up her project. Having married Rev. CALVIN PHILLEO, a Baptist clergyman, she moved to Kansas, where she has just died of influenza, at the ripe age of eighty-seven years.

—Sir JOHN MACDONALD, the Canadian Premier, is seventy-five years old, and yet possesses the energy and capacity for work of a much younger man. At the age of five years he was brought to Canada from his native Glasgow, and half a century ago had won an enviable reputation as a lawyer. In personal appearance the Premier is rather tall and slender, and the resemblance of his face to that of DISRAELI has been observed by many. His astuteness as a politician has kept him from bigotry in religion, and it is said that he attends services at the churches of the different denominations in Ottawa with delightful impartiality.

—A "Lucy Webb Hayes Temple Association" has been formed at Washington, by SUSAN B. ANTHONY, CLARA BARTON, and other prominent women, to erect a building in memory of Mrs. HAYES, which will be known as the Lucy Webb Hayes Temple. A drinking fountain and a statue of Mrs. HAYES will adorn the front of the structure, while busts and portraits of other well-known women will be placed inside. Five thousand charter members, each with a subscription of five dollars, are wanted to give the project a good start.

—The richest man in Alabama is H. F. DE BARDELEBEN, a Birmingham iron manufacturer, who is supposed to be worth about $8,000,000.

—More than three thousand congratulatory letters and telegrams poured in upon Mr. GLADSTONE on his eightieth birthday, which recently occurred.

—Striking testimony to the power for good exerted by *Ben-Hur* is the proposal to make use of the story in the evangelistic work of foreign missions. General LEW WALLACE has been strongly urged of late to assist in the missionary enterprise of publishing an Arabic translation of the story in Syria.

—SIDNEY DICKINSON, a graduate of Amherst College and of several newspaper sanctums in New England, and more recently an entertaining lecturer on art, has fallen from grace, and become an insurance agent in Australia.

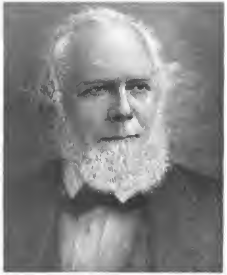
—The remains of Millionaire FLOOD and his family are to rest in a magnificent mausoleum in Lake View Cemetery, at San Francisco. It is to cost at least $100,000.

—Since the giving way of his health and mental powers about a year ago, JOHN RUSKIN has been confined to Brentwood, his residence in Cumberland, England. Here he is surrounded by the treasures of art and other valuables which he has gathered during the past twelve years at an expense of over $500,000. The collection includes many gems from English and foreign artists, thirteen hundred missals, and a number of precious stones.

—Professor E. J. PHELPS, ex-Minister to England, is again lecturing before the Yale law students. He seems to have grown older in appearance, but has lost none of his rare ability as a teacher.

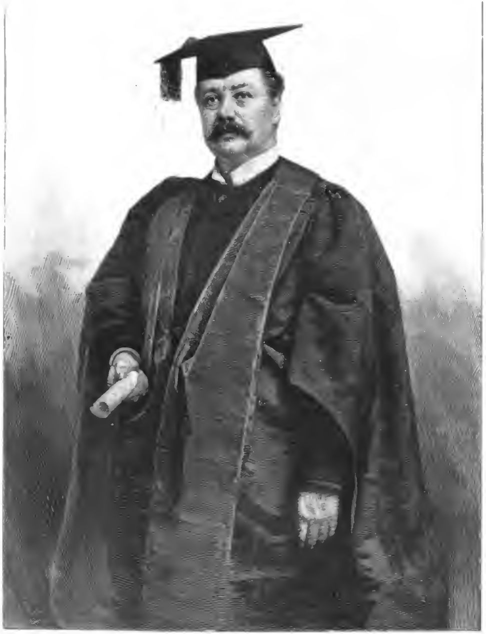
—The youngest man in the House, at Washington, is CHARLES H. TURNER, the "ice-man," recently elected from the Sixth District in this city. He is twenty-eight years old, and has already made a speech on New York's claims to the World's Fair.

—WILLIAM TAYLOR ADAMS (Oliver Optic) served an apprenticeship as a hotel-keeper when a young man, but soon left this for the more congenial work of teaching and writing. Up to 1865 he was master of one of the Boston schools, and since then has given up his time to writing. Mr. ADAMS is a practical yachtsman and a skilful worker in wood and iron, a well-arranged workshop in his delightful home at Dorchester, Massachusetts, enabling him, as the spirit moves, to indulge in his taste for mechanical pursuits.



HENRY DRISLER, JAY PROFESSOR OF GREEK, AND LATE ACTING PRESIDENT.

THE RT. REV. HENRY C. POTTER, D.D., BISHOP OF NEW YORK.



SETH LOW, PRESIDENT

HON HAMILTON FISH, CHAIRMAN OF THE BOARD OF TRUSTEES.

CHARLES F. CHANDLER, PROFESSOR OF CHEMISTRY.

THE NEW PRESIDENT OF COLUMBIA COLLEGE AND SOME OF HIS ASSOCIATES.—From Photographs.—[See Page 111.]

We approached the strange barrier cautiously, and our wonder at it was increased as we found that it was made of the bright metal of which we had found so many specimens; and still more we wondered as we found that the bars were fastened on the side from which we approached—so that we could remove them easily, while from the side of the valley they presented an impassable barrier. In strong excitement we drew out the metal pins which dropped into slots cut in the rock and so held the bars fast; and in a few minutes we had cleared the way for our advance. Just as we were making ready to pass through the opening we heard the sound of voices; and as we quickly drew back into the shadows two men sprang up before the opening, and cried in wonder as they saw that the lower bars across the opening were gone. Yet the expression upon their faces was not that of anger; rather did they seem to be stirred by a strong feeling of joy, with which was also awe. Both men were accoutred in the fashion which the pictured records show was usual with the Aztec warriors, and one of them—as was indicated by his head-dress and by the metal corselet that he wore—was a chief; and they challenged us sharply, yet with gladness in their tones, in the Aztec tongue.

So sudden and so ringing was this challenge, and so startling was the uprising of the men before us, that as we sprang back into the shadow we instinctively stood ready with our arms. But Fray Antonio, not having any intent to join in the fight, was cooler than the rest of us, and instantly perceived that fighting was not necessary. Therefore he it was who first spoke to these strangers; and his first word to them was, "Friends!"

Then the watchmen, for such they seemed to be, spoke eagerly together for a moment, and pressed to the opening to look upon us, yet seeing us but dimly because of the dark shadows which surrounded us. Pablo was closest to them, and I marvelled to see how like them he was in look and in air. Him they first caught sight of, and as they saw him they both turned from the opening, and, as though calling to some one at a distance, gave both together a great glad shout. Instantly, at some little distance, the cry was repeated; and so again farther on and yet further, with ever more voices joining in it; so that it swelled and strengthened into a great roar of rejoicing that seemed to sweep over the whole of the valley before us, and fill it everywhere with tumultuous sounds of joy.

As though the duty that they were charged with had been thus accomplished, the men turned again to us, and he of the higher rank, speaking the Aztec language, yet with turns and changes in that tongue which were strange to me, eagerly called to us:

"Come forth to us! Come forth to us!" he cried. "Now is the prophecy of old fulfilled, and the watch rewarded that our people have maintained from generation to generation through twenty cycles here at the grated way! Come forth to us, our brothers—who bring the promised message from our Lord and King!"

I turned to Fray Antonio as these words were spoken, and I saw in his face that which made me confident in my own glad conviction that here at last was the secret place for which so long, and through such perils, we had sought. Here indeed had we found the hidden people of whom the dying Cackpin had spoken and of whom the monk's letter had told; the strong contingent of the ancient Aztec tribe that ages since the wise King Chaltzantzin had saved apart, that when their strength was needed they might come forth to ward their weaker brethren against conquest by a foreign foe. And the great happiness begotten of this glad discovery filled all my body with a throbbing joy.

Yet as we went out through the opening that we had made between the bars, and the watchers saw us fairly in the sunlight, they sprang back as though in alarm. Rayburn met this demonstration promptly by making the peace sign—raising aloft the right arm—that is common to all North American Indians; and after a moment of hesitation the chief answered to this in kind. So there was peace between us as we advanced; but it seemed to me that their regard of us now had in it more of wonder and less of awe.

[TO BE CONTINUED.]

CROWDING THE ELEVATED TRAINS.

The verity of our first-page illustration this week will be appreciated by every one familiar with New York city. The uncomfortable crowding of the elevated trains morning and evening has become a permanent condition, and will so continue until the demand for rapid transit in the metropolis is very much more satisfactorily met than it is at present. The picture portrays what may be seen at almost any station during the busy hours.

The situation is at its worst at the City Hall terminus of the Third Avenue line. There the crush at times becomes almost painful, and for weak and aged persons is even not without the element of danger. A veritable jam forms at each car entrance, and when the last out-coming passenger finds a precarious foothold on the station platform, the turbulent in-pouring, attended with bumps and collisions, which are not recked of in the general excitement, begins. It is interesting to note on the countenances of many of the waiting throng the different phases of the struggle going on between dignity and the desire for a seat. The individual who is in the habit of stating with pride to his acquaintances that he "never gets left" is on hand in force. There is none of the struggle in question in his case, however, since he pays no tribute whatever to dignity. Seats are not numerous enough to go round, and he makes it his business to have one. He pushes his way through the crowd, edges in ahead of others, irrespective of sex, and rarely fails to win. His contempt for a man who will let a woman beat him, or who will yield to her a seat he has secured, is unspeakable. From this individual the degrees of hoggishness are shaded down, gradually giving way to good manners, of which representatives are not lacking. Be it said to the credit of human nature that there are many evidences of its better as well as its worse side at an elevated railroad-station.

There is no more than sufficient space on the platforms, as a rule, to conveniently accommodate, when the traffic is at its height, the regular gathering of passengers, and the consequence is that when trains are delayed there is a speedy congestion, all of which, unpleasant as it is, goes to show what a valuable and indispensable service the elevated railroads render the city. The primal cause of the prevailing difficulty is the placing of an extensive steam transportation system in streets that were not intended for or laid out for such a purpose. Necessarily, the facilities for trains and room for stations, so long as they are constructed wholly on the ordinary public highways, are limited. The effort has been to put new wine in old bottles, and it has not proved entirely successful. The time may or may not come when there will be means of transit in New York fully adequate to comfortably provide for passengers; but it is certain that improvement in that direction is retarded by the marvellous meekness with which the people of the city submit to being stood up on aisles and platforms, hung on straps, and to being packed in cars like sardines, if the transportation corporations elect to do business on that basis. Our picture represents one feature of the packing process.

GENERAL SHERMAN.

Of the famous Union army commanders of a quarter of a century ago, only by a rare exception has one here and there lived to complete his seventieth year. Grant, Sheridan, Thomas, Meade, Halleck, McClellan, McDowell, Hooker, Burnside, and others, died before the Scriptural allotment of threescore and ten, and the same has been true of Hancock, Warren, and many other illustrious corps commanders. But General William Tecumseh Sherman, alert in mind and soldierly in bearing, still remains among us, sought out and honored everywhere in these piping times of peace as in the strenuous days of old. If in his countenance the grim look of five-and-twenty years ago has softened, if the tall form tells something of the ravages of time and of the tumultuous experience which has shortened the lives of so many veterans of the war, yet he is happily still vigorous, and a noble type of the American veteran soldier. In history he will hold unchallenged the second place for achievement and fame among Union generals, surpassed only in renown by that great captain whose trusted lieutenant he was throughout the war.

It is remarkable that Grant and Sherman were both natives of Ohio, where also a third renowned soldier, Sheridan, had his home from childhood, supposing himself, indeed, until researches made within two years of his death, to be an Ohioan also by birth. Like Grant, too, Sherman had long left the army for civil life when the guns of Fort Sumter called him back. His experience in that interval is curious to recall. Born February 8, 1820, at Lancaster, being the sixth of eleven children, on the death of his father—a lawyer by profession, and Judge of the Supreme Court of Ohio—he had been adopted at the age of nine by Thomas Ewing, of Lancaster, who afterward became Senator from Ohio and Secretary of the Interior. Sent as a cadet to West Point when sixteen years old, he was graduated, in 1840, sixth in a class of forty-two, which included that masterly soldier George H. Thomas. As a Second and then as a First Lieutenant in the Third Artillery, he served in Florida and other Southern States, but when the Mexican war broke out was, to his great discontent, detailed for recruiting duty. However, assigned at length to a battery which had been ordered to California, he made the voyage around the Horn, and his descriptions of subsequent life on the Pacific coast form interesting chapters of his admirable memoirs. Returning to Washington in 1850, he married Miss Ellen Boyle Ewing, daughter of the Secretary, and soon after was made a Captain in the Commissary Department. Three years later he resigned from the army, which then had so little to promise, and became manager of the San Francisco branch of the bank of Lucas, Turner, & Co., of St. Louis. On the closing of this branch, in 1857, he became for a time an agent in New York of the same banking house. Next, with his brother-in-law, he formed at Leavenworth the law partnership of Sherman & Ewing. His succeeding venture, which followed rapidly, was as Superintendent of the Louisiana State Military Academy at Alexandria, an occupation broken up by the secession of that State. One more experiment remained in a record which recalls the various changes Grant was simultaneously undergoing in civil life. Sherman became, early in 1861, President of the Fifth Street Railroad in St. Louis. Then at last war opened to him his great career.

Appointed Colonel of the Thirteenth Infantry, a regiment to be raised for the regular army, Sherman commanded at Bull Run the Third Brigade of Tyler's division, comprising the Thirteenth, Sixty-ninth, and Seventy-ninth New York, and Second Wisconsin, and there, as he has said, "for the first time saw cannon-balls strike men and crash through the trees." Soon after this battle he was made a Brigadier-General of Volunteers, and assigned to the Department of the Cumberland, under General Robert Anderson, whom he soon succeeded in command. There he astounded the Washington optimists, who were going to put down the revolt in sixty days, by declaring that to simply retake the Mississippi Valley would require 200,000 men. The newspapers said he had gone crazy, and he found his own officers and soldiers looking askance at him. This odium, hard to bear at the time, vanished a few months later, when, in April, 1862, in command of a division of Grant's army, he bore the brunt of the tremendous Confederate attack at Shiloh, the bloodiest battle ever fought till then on this continent. "I feel it a duty," said Grant, in his report of that fearfully "close call" for the Union forces, "to mention a gallant and able officer, Brigadier-General W. T. Sherman," who "displayed great judgment and skill in the management of his men." Still more emphatically Grant afterward wrote, "To his individual efforts I am indebted for the success of that battle"; while General Halleck, then in command at the West, sent word to Washington, "It is the unanimous opinion here that Brigadier-General W. T. Sherman saved the fortunes of the day on the 6th, and contributed largely to the glorious victory of the 7th." On the first day of the battle Sherman had been wounded in the hand, but continued at his task. Assuming command in the field, Halleck slowly spaded his way to Corinth, which Beauregard called "the strategic point of the campaign," as, indeed, its capture showed, since with its fall followed that of Memphis. To the command of Memphis, accordingly, Sherman was assigned, and there he displayed vigorous administrative qualities. He was made a Major-General of Volunteers, to date from May 1, 1862.

A splendid aspiration had taken possession of the West—that of reconquering the Mississippi from Cairo to the Gulf—and this alike defined and stimulated its efforts. On that line Vicksburg was the next stronghold to attack, and Sherman was called upon by Grant to lead an expedition thither. This he promptly did; but his assault was repulsed, owing partly to the unexpected strength of the works, and partly to Van Dorn's capture of Holly Springs, Grant's own base of supplies, which destroyed his power to give the prearranged co-operation. Sherman, however, under McClernand, promptly utilized his force by attacking Fort Hindman, on the Arkansas, which was captured, with a garrison 5000 strong. Then Sherman took part with his corps, the Fifteenth, in Grant's campaign against Vicksburg, which, after the victories of Champion's Hill and the Big Black, was crowned with the surrender of the city and its works, containing more than 230 cannon and 30,000 men, all that was then left of Pemberton's army. That same day, the 4th of July, 1863, Sherman was hurried off against the co-operating force of Johnston. "When the place surrendered on the 4th," Grant reported, "two days earlier than I had fixed for the attack, Sherman was found ready, and moved at once."

But his reputation for celerity was soon to have other tests. Rosecrans, having encountered Bragg in the tremendous battle of Chickamauga, had fallen back into Chattanooga, and was virtually under siege. Grant, summoned thither from Vicksburg to take command, hurried Sherman, who had succeeded to the command of the Army of the Tennessee, to the rescue. Arriving at Chattanooga from the long march, Sherman took post on Grant's left at Tunnel Hill, and when all was ready engaged the enemy hotly; while Thomas, with the Army of the Cumberland, "forming on the plain below with the precision of parade," swept magnificently across Mission Ridge, and drove Bragg back into Georgia. Meanwhile Burnside had been besieged by Longstreet at Knoxville, and was in great stress. Without a pause for rest, Sherman was sent to his relief; but Bragg's disaster had broken up the siege, and Sherman marched back to Chattanooga. Returning to Vicksburg, he organized a strong expedition and raided the country to Meridian, destroying Confederate communications. Congress voted thanks to him and his men "for their gallant and arduous services in marching to the relief of the Army of the Cumberland, and for their gallantry and heroism in the battle of Chattanooga, which contributed in a great degree to the success of our arms in that glorious victory."

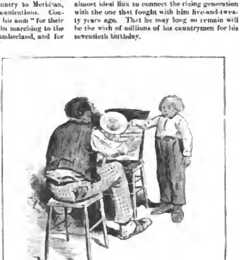
The spring of 1864 opened with Grant in Virginia, commanding all the armies as Lieutenant-General Sherman, and in charge of the campaign at the West, succeeding Grant as commander of the Military Division of the Mississippi. Starting from Ringgold, in front of Chattanooga, with nearly 100,000 men, including Thomas's Army of the Cumberland, over 60,000 strong, McPherson's Army of the Tennessee, and Schofield's Army of the Ohio, Sherman drove back his opponent, the wary and skilful General J. E. Johnston, in a series of remarkable movements, now fighting and now flanking him. He forced him from his stronghold at Rocky Face Ridge by turning his left, and when he fell back to Resaca, Sherman fought him there; then, threatening his flank again, threw him back to Cassville and across the line of the Etowah. He fought him at New Hope Church and at Dallas, and assaulted him on the impregnable heights of Kenesaw. Then returning to his old manœuvre of a flank march to the right, he executed it with a superb skill that placed him firmly on the Chattahoochee, with all North Georgia in his power. Alarmed at the progress of the Union arms, Jefferson Davis displaced Johnston by Hood, the dashing Texan, who tried the offensive, only to be severely defeated at Peachtree Creek, Atlanta, Ezra Church, and Jonesborough. Then Sherman entered Atlanta in triumph. The whole North rang with applause, and President Lincoln sent him the thanks of the nation "for the distinguished ability and perseverance displayed in the campaign in Georgia, which, under divine favor, has resulted in the capture of Atlanta. The marches, battles, sieges, and other military operations that have signalized the campaign must render it famous in the annals of war."

Hood, bent on retrieving his fortunes, struck out northward for a campaign in Tennessee, hoping to force Sherman's retreat. But the Union strategist sent Thomas to confront that danger, and in due time Hood was checked with severe loss by Schofield at Franklin, and then overwhelmingly defeated by Thomas at Nashville, in one of the few pivotal battles of the war. Meanwhile Sherman, cutting loose from his base, marched from Atlanta seaward, foraging on the country, and furnishing one of the most memorable examples in history of the great movable column. Approaching Savannah, he carried Fort McAllister by assault, and the country was thrilled with this message from him to President Lincoln, "I beg to present you as a Christmas gift the city of Savannah, with 150 heavy guns and plenty of ammunition; also about 25,000 bales of cotton."

Refitting without delay, Sherman set out, when February opened, upon another great march, this time for the conquest of the Carolinas and an approach to Richmond. His right wing was under Howard, and his left under Slocum, with Kilpatrick commanding the cavalry, as in the march to the sea. Wading swamps, fording rivers, and scattering opposition before it, his triumphant army pressed northward. Charleston was evacuated by Hardee, when Sherman, passing in its rear, cut its communications; Columbia fell into his hands; the line of North Carolina was crossed; and the enemy was fought at Averasborough and Bentonville. Then Sherman joined hands at Goldsborough with Schofield, who had marched up from the coast and taken Wilmington.

And now the end was at hand. Lee, trying to escape from Richmond, was pursued by Grant, overwhelmed, and forced to surrender at Appomattox. Then Johnston capitulated to Sherman at Greenville. It only remained for the two great conquering armies to march in triumphal review through Washington—Grant's on the 23d of May, and Sherman's the day following. Then the conquering forces melted back into the current of simple citizenship, and peace came with a restored Union. The country testified its admiration by creating for Grant the grade of General, and raising Sherman to that of Lieutenant-General. When Grant became President, Sherman in turn took his place as General, and by special exception retained the full pay of this grade on his retirement from the active list at the age of sixty-four.

Such is an outline of the achievements of a soldier the originality and breadth of whose generalship have made his campaigns alike in strategy and tactics the admiration of his countrymen and a professional study the world over. A most picturesque writer and one of the most eloquent speakers among American professional soldiers of our time, he has also a personality so marked with its soldierly directness, its frankness pushed to a fault, its prompt, invariable renunciation of political honors and temptations, and its sympathy with the hundreds of thousands of veterans, who still talk of "Uncle Billy," that he becomes an almost ideal link to connect the rising generation with the one that fought with him five-and-twenty years ago. That he may long so remain will be the wish of millions of his countrymen for his seventieth birthday.



WAITING FOR A SIGN.

"Peder, vwen I squeeze mein left eye, you turn de leaf, so dere vwon't pe no break in de moosic;" and so poor Peter stands for an hour at a time gazing into his ancestor's left eye.

see, they can't make 'way with so much [illegible]. Don't ye know it? Then a farm always runs down under sich circumstances. It's the best thing to sell it; for if ye hire a manager, he manages to put everything into his own pocket."

"Oh yes, I expect that, Cousin Curtis; but I do get a tolerable livin' here, after all, 'n' if I go to live with Mary Frances, I shall be beholden to her 'n' her husband, 'n' 'tain't a comfortable feelin' to be eatin' other folks's bread. I don't see how I can part with the old place, either. I've lived here goin' on thirty-five years, ever since I was married. Mary Frances thinks I'd never be perfectly satisfied with all the lace, buildin's, and everything there is in 'em. She says there's nothin' in the house she cares about, 'n' she don't see why I should care about sich a lot of old-fashioned rubbish. There's just the words she used. 'Rubbish!' Why, there ain't a house in the place that's furnished better, exceptin' the Winslow's, maybe; and she was so proud 'n' pleased herself when we had that new ingrain carpet for the parlor, 'n' them stuffed chairs, 'n' the centre table. 'N' when her father—poor David that's gone—bought her that flowered chamber set for her own room, she was so tickled that she did nothin' but set 'n' look at it for days 'n' days. 'n' still, the last time she was here, she'd like the hall clock, sich clocks were in fashion now, only 'twasn't nice enough. She'd rather buy a copy of the antique than to have folks think we'd inherited sich a common old thing."

"Sho!" remarked Cousin Curtis, as Mis' David paused a moment with quivering lip.

"She did condescend to take my best brass andirons, and grandmama's spinning-wheel," she went on. "She was a-goin' ter her gilt or somethin' put on ter the wheel, 'n' her it for a parlor ornament. She didn't say what she was a-goin' ter do with the andirons; put 'em up on the mantel-piece for a show, very likely. She has just such useless things on at her home. But it does hurt me unaccountable ter hear her so unfeelin' about the place, though p'r'aps she's right about sellin' it. She was a real happy girl, too, 'n' liked her home, 'n' set out rose-bushes in the front yard, 'n' fixed up comfortable with her own hands." Mis' David's voice grew very husky, and tears began to roll over her wrinkled cheeks. "But Mary Frances's ways ain't my ways now; I lost her before ever she married Walter Riggs. 'Twas when I sent her over ter Dean Academy she got made over, 'n' I haven't had much comfort with [illegible]. She don't seem half as much like a

found, after I sent her home, that two whole jars of my strawberry preserves had been eat up, as well as a whole loaf of my thickest plum-cake, with brandy in it, that I calculated would last me for company for a year at least, 'n' she didn't stay but a little over three weeks."

"Sakes alive! I don't wonder she had nightmare!" ejaculated Cousin Curtis.

"Then one o' them Smiths that live up 'Town Pond way came, and wanted me to take his girl Almira. He said she'd been away to work in the factory, and it had kind o' wore on her; 'n' as she couldn't afford to lay still—they was real poor folks—they was dreadful anxious to get her a place to help in a family. I inquired about the girl, 'n' folks said that knew her they calkilated she'd be just the one for me—real quiet 'n' lady-like, 'n' neat 'n' industrious about the house, handy with her needle, too; 'n' belonged to meetin', decent folks. I thought my troubles was over when she come, for I liked her first-rate. She was beautiful company, 'n' understood my ways; didn't turn the nose o' the tea-kittle toward the wall, nor put scented bedroom soap into the dish-water. But, goodness gracious! if she didn't have nightmare! 'Twas the strangest happ'nin'. She didn't have it reg'lar every night, like t'other one, but 'twas just as bad, as I couldn't sleep for listenin', 'n' expectin' every minute she'd fetch a screech. Such screeches as she giv' would freeze the blood in yer veins. The first time she did it I thought the house was afire, 'n' jumped out of bed 'n' went to pumpin' water as hard's I could pump; hurried me so I couldn't set up the next day. She didn't look well, but 'twasn't nothin' that ailed her, so I doctored her up with thoroughwort tea 'n' [illegible] for her blood, to see if she wouldn't quit it. But she didn't. She kep' it up just the same, 'n' I found I was gettin' all run down with loss o' sleep 'n' anxiety, so I had to send her away. But I giv' her father a good coat that b'longed to poor David that's gone, 'n' her a new dress—one that Mary Frances sent up 'n' it didn't suit me. They was so poor, I hated to turn her off."

"Well, Mis' David, you've always been a-lookin' for the finger o' Providence, 'n' now you've got it plain. If sich a curse happenin' as that—them two nightmare-hired girls, one after t'other—don't mean somethin', I'll be beat. 'N' what can it mean, but that you'd better sell the place, 'n' go where you can be taken care of as you'd orter be."

"It does 'pear like a curi'us dispensation," sigh-

There was a boy over in the poor [illegible] wanted to get a place for to work for his board and clothes. They said he was as good as a man about the house, knew how to milk, and was real strong and lovely. She was going to send for him, and if he proved satisfactory, she should go on living in the same way.

But alas for poor Mis' David! The new boy was anything but satisfactory. He made his debut by stealing nearly all the pots and kettles in the house, which he sold for old iron, investing the modest sum which they brought in pea-nuts at the variety store; and one night, the sixteenth of the month, she found herself alone once more. In the morning, when one of her neighbors came over in the midst of the sleet and wind to look after her, he found her unable to move hand or foot, having been seized with one of her sudden attacks of the "rheumatics." There was no fire in the house; the barn door had blown down; the cows hadn't been milked since the morning before, and were nearly perished with the cold. Mis' David wrote to Cousin Curtis as soon as she was able to do so, and told him she had made up her mind. She shouldn't sell the farm, oh no! she was worse than ever she couldn't do that; but she should let it to John Perkins, Luke's cousin. He had agreed to let her reserve two small rooms, where she could store away enough furniture to keep house with, if she should be able to come back in the spring, and she would like to have the other things sold as soon as possible, as she didn't like to have the sale before her to dread for long.

Cousin Curtis came over to Portsport at once to make arrangements for the auction. Notices were printed and displayed in the stores, the post office, along the fences, and on the guide-posts. Nothing else was talked of in the town, for never in its whole history had a sale of this sort been known before. Once a farm had been disposed of under the hammer, a piggery, and the mill over at Dark Cove, but never any household furniture. Then Mis' David's furniture, her table linen, crockery, and blankets, her curtains and carpets, had long been the envy of her neighbors, and the fame of their elegance had reached the surrounding towns and hamlets; and now that there was going to be an opportunity to inspect these articles at one's leisure, and it might be, fortune favoring, to possess one or more of them for paying half of the original cost at least, there was great agitation of mind on the part of the entire feminine community. Heart-burnings, impatience,

ed by the sunshine; the lone tree in the [illegible] each old, old friends; the pump in its tower of evergreen, the frost melting like steam from its weather-beaten sides as she so often had seen it before, even the chairs and tables within; the monthly-rose bushes and sage-geraniums in the kitchen window; the gossiping old clock; the tiggers in the homespun rugs; and the cherished carpet. There was nothing that was not endeared to her heart by some tender association, with the exception of a few stylish modern articles which Mary Frances had sent to her from the city.

Cousin Curtis and Caroline his wife appeared at an early hour. Cousin Curtis very solemn and important, Mis' Caroline eager to see if there was not something among the things which she especially wanted.

"It's a funeral that's goin' to be, ain't it? You look just like it, Cousin Curtis, 'n' I can't git it out o' my mind that it's so," said Mis' David, as they entered the house. "I find myself a-talkin' about real soft, 'n' kinder holdin' my breath, 'n' there's the same dretful dread weighin' me down."

"Sho! you take things too hard. You're just like your mother before ye. Everybody says she wore herself out a-frettin' about nothin'. The Batchelders are all master-hands for takin' on."

By this time more relatives and particular friends were arriving, and Mis' David donned her best bonnet, with the widow's cap and long crape veil, as if it were an affair of great ceremony at least, and sat down in the midst of them, white and trembling.

"Cousin Curtis, you know you said you'd bid in whatever I didn't feel as if I could part with, 'n' I think 's likely I shall feel 't the last minute as if I couldn't let some things go, though now I've been 'n' brought such trouble on myself, I mean ter be firm, 'n' go through it as far forth 's I can. So you just stay by me 'mongst the mourners, so's 't I can git hold of ye when I want ye."

"Poor dear soul, I'm 'fraid she's a-gettin' kinder light-headed," whispered one of her old friends to another; "'n' that Cousin Curtis, as she calls him, I really believe is at the bottom of it all. My husband says he's determined ter git holt o' the farm somehow, 'n' he thinks if he can once get her away from it and her furniture sold, he can manage ter get it into his hands by hook or by crook. 'N' she's just as unsuspectin' as a babe."

"Oh yes; lots o' folks say that. But 'tain't winder curtains. I'm told they've been used for some little time; but you can see they're good as new, magnificent in color, 'n' durable as well as handsome—pure silk 'n' wool. What am I to have for these splendid articles?"

Mis' David listened with calmness. She had more than once been anxious to get rid of those curtains. They shut out the air in the summer, made the room dark and gloomy, and did not coincide at all with her idea of the fitness of things. David that was gone did not approve of them either. But Mary Frances brought them from her own house, and had them put up there, so she had let them be. She wondered a little that the auctioneer should think them so splendid, that was all.

The bidding was very lively on these curtains, as Mrs. Deacon White and Mrs. Hiram Pratt were both determined to have them. Each knew the other's determination beforehand, and Mrs. White, whose purse was much longer, was prepared to pay any price for them, for the sake of outdoing her neighbor, who had no right to aspire to such fine things. Both ladies had very flushed and excited faces, and to get them from Mrs. Pratt, Mrs. White was obliged to pay more than their original cost. When they were finally knocked down to her, she marched in triumph across the room, stationing herself before one of them to keep off intrusive fingers, and her two daughters before the others.

"I declare that was doin' well," chuckled Cousin Curtis in Mis' David's ear.

"Now the carpet's a-goin'," some one said, eagerly.

"No, no, no, Cousin Curtis, not the carpet. I don't know what I was a-thinkin' of to calc'late I *could* part with that," said Mis' David, seizing her relative by the arm. "Poor David that's gone 'n' me 'n' Mary Frances picked it out, 'n' David he alwus liked the pattern, 'n' we used to sit in the parlor hot summer Sundays—'tis always cool there—'n' enjoy it. Oh, don't let anybody git that! Bid higher'n anybody *could* pay for it."

Cousin Curtis looked somewhat contemptuous, but followed her directions, to the hot indignation of several ladies who had long coveted this possession of Mis' David's.

An arm-chair that Mis' David never liked, and no one could sit back in comfortably, she allowed to be sold, also a large black-walnut-framed mirror, with some compunctions, to be sure, because they were gifts from Mary Frances.

"But not the lounge—not the lounge, Cousin Curtis. Why, he set more by that 'n anything we ever had, though he didn't use it much; 'twas only to look at it thet pleased him so, it bein' all flowered over in sich harnsum colors."

"What d'you have an auction for, if you don't want ter sell nothin'?" snapped Cousin Curtis. "Joe'll think you ain't satisfied with what your stuff brings, 'n' goodness knows you've got full what its wuth, so far."

"The Lord only knows what I hed the auction for," said the poor woman, devoutly. "But never mind what Joe thinks, he'll git his pay just the same."

The auctioneer, with the crowd pressing after him, was in the sitting room now, and standing beside David's old mahogany secretary, demanded a bid for that ancient but well-kept piece of furniture.

Mis' David started. Why, it seemed to her as if she could see David sitting before it now, laboriously intent on writing a letter, with Mary Frances looking over his shoulder and the cat asleep in the window beside him, the glow of the fire-light filling the room. She could hear the click of her own knitting needles, and the snapping of the logs in the still, peaceful atmosphere. She rose from her seat: "No, no, no! not that," she cried. "You mustn't be affronted with me, folks, nor think I meant to git ye here fur nothin'. I didn't think this business was a-goin' ter ketch hold o' me so, but I can't part with any more o' my things. They're jest like live things speakin' to me o' days past 'n' gone. I'm a poor old woman, 'n'—" Here her voice faltered, and she fell back against Cousin Curtis's shoulder in a dead faint.

A general panic ensued, for it was supposed by all, with the exception of the little circle around her, that the old lady was dead. "Poor soul! it broke her heart to think o' breaking up her home," they said. And with the greediest and most disappointed of them pity was uppermost, as, after blocking up every door and passageway until they were peremptorily ordered away by the doctor, who was present, they reluctantly took their departure.

Mis' David was conveyed into her bedroom, where, the needful restoratives being applied, she soon recovered consciousness.

"I shall hev to write a word ter Mary Frances as soon's I'm able," she said, after swallowing a great deal of hot beef tea, which is the panacea for every woe at Pennport. "I shall never leave this house as long's I live 'n' hev my senses, 'n' I must let her know, ez she was a-goin' ter meet me at the depot in Springvale to-morrer night. I know I can manage some way not ter be beholden ter my neighbors. I can hev that left-handed boy back agin anyway; 'n' even he, with all his outlandish actions, is better'n sellin' away yer house 'n' home. He'll only wear me out a little sooner, 'n' when folks hev ter live alone, the sooner they go the better."

"I sh'd like to know what yer goin' ter do with the man you let the farm to. 'Tain't nothing ter go back on your word, I s'pose," said Cousin Curtis, wrathfully.

"I can very well pay him for his disappointment. I jest got the pay for some wood I sold last winter, 'n' he's welcome to it," said Mis' David, cheerfully. "I'll pay him enough to pay for another farm for a year, if he says so."

And Cousin Curtis left, muttering something about "ingratitude, 'n' imbecile old women."

[illegible] entered by the door which he opened to go out—a young lady, very daintily dressed, followed by a tall, smiling young man.

"Why, Aunt Emmeline, what *does* all this mean?" the young lady inquired, looking with amazement at the empty closets and crockery-piled tables.

"Why, it means, Flory, that I tried ter do what you advised me ter do so strongly—let the place, 'n' sell out my furniture. But the spirit was weak, 'n' I couldn't do it. How happens it you're here with Frank?" And Mis' David, sitting up on the lounge, looked ten years younger.

"Why, aunt"—hesitating a little—"Frank and I were married this morning. I had to marry him, you see"—with a roguish glance at her husband—"I got so worried about leaving you alone. Why, you poor dear old soul, you look as if you had been very ill."

"I'm well enough now. But what about the Adam's apple? You said you couldn't hev him on account o' that, nohow."

Flora burst into laughter. "Oh, aunt, you didn't think I meant that really. Why, he hasn't any to speak of. We had a misunderstanding, you see, and I felt almost desperate. I urged you to sell everything, and go and live with Mary Frances, because I felt that was the only thing to do. I thought I should always be obliged to teach school, for I knew I could never marry any one else, and—"

"Only a foolish young folks' quarrel, I s'pose," interrupted Mis' David; "'n' I took it for the finger o' Providence a-p'intin' the way to Mary Frances's. But, ye see," she added, seriously, "Providence p'inted straight enough, but I was too impatient, 'n' didn't wait till I got composed in mind, 'n' see it clear. It's jest like that kinder blurred guidepost round the corner out there by the four roads; if ye git in a hurry 'n' don't wait till ye git so's ter read it plain, you're more'n likely to turn off the wrong way."

SUSAN HARTLEY SWETT.

"LA CHAMPAGNE" AMONG ICEBERGS.

THE latter half of the month of January, 1890, will long be memorable in the annals of marine disaster, for rarely has there been such tempestuous weather on the Atlantic, accompanied with such wide-spread destruction of life and property. Furious hurricanes and tremendous seas tested the staunchness of the most powerful transatlantic steam-ships, and tried the skill and endurance of both officers and men to the utmost; men were washed overboard, while others were seriously hurt by falling top-hamper, or had their hands and feet frost-bitten by the piercing cold, which covered the rigging and decks with thick ice; and in some places the sea was covered for miles with dead cattle, smashed life-boats, and wreckage of every description.

During the past week, while the rigor of the weather had somewhat abated, most of the captains of storm-tossed vessels had stories to tell of vast fields of ice floating down from the north in the direct path of transatlantic steam-ships, and several icebergs of monster size had been sighted by incoming steamers. One steam-ship, the *Nessmore*, from Baltimore to Liverpool, actually ran into one, but fortunately escaped with no other injury than some damage to her bows. The Inman liner *City of Chicago*, which had an exceptionally hard time of it, entered an immense ice-floe at 10 P.M., January 23d, and did not pass through all of it until three o'clock the next morning. The *Adriatic*, of the White Star Line, and one or two others, had a similar experience; they were for hours thumping their way through ice packs, and had their decks swept of everything movable by the heavy seas which were running outside and west of the floes.

But the steamer *La Champagne*, Captain Boyer, of the French Transatlantic Line, seems to have had the most unique, if not the most unpleasant, voyage of all. Leaving Havre on January 18th, just in time to catch the heavy northwest storm which had damaged many vessels before it reached her, for the first few days *La Champagne* was buffeted about in merciless style; her decks were continually being swept, her rigging was heavily ice-coated, and her deck railings damaged, but, with the exception of the loss of her life-boats, she sustained no great injury. The storm somewhat abated by the 23d, after which she made her way through a series of alternating calms and violent squalls, accompanied by chopped seas, that sadly tried the patience of passengers and crew, until the 25th, when her people were treated to a display of nature's handiwork which they are not likely to forget as long as they live. On that day the weather had greatly moderated, and the passengers were beginning to resume their long-suspended cheerfulness, when, at 3.15 P.M., in latitude 45° 45', and in longitude 49° 50' (west of Paris), a genuine iceberg of the much written about but seldom seen sort was sighted, and within two hours two others, surrounded by ice-fields several miles in extent, made their appearance. The captain, who made observations, estimated the largest of the icebergs to be about 200 feet in height above the water-line, with a breadth of much greater extent. Happy for him and his good ship that he did not have to repeat the memorable feat of the *Arizona*, when she ran full tilt against just such an antagonist in the spring of 1879, or, more recently, of the *Nemours*.

The French steamer passed slowly through the heaving ice pack to the right of the icebergs, one of which presented the appearance of a moderate-sized island, with a gently sloping surface; and the other, the tallest of the three, looking like a pinnacled church steeple from one of its fronts.

The passengers of *La Champagne* had every opportunity of studying the rapidly changing effects of light and shade on the summit and precipitous sides of the icebergs, and were, one and all, entranced by the magnificence of the spectacle. After ploughing her way through the ice packs, *La Champagne* had fine weather during the remainder of her voyage, arriving off Sandy Hook at 6.32 P.M. of the 27th, two days behind time, but with all on board safe and sound, after their varied and exciting experience of old ocean's humors.

THE SEVENTH REGIMENT'S CUP.

THE "Edward Kemp Trophy," presented last spring to the Seventh Regiment as a standing annual prize to be awarded to the company of that organization exhibiting the best marksmanship, was won for the first time by Company H in the match which closed January 24th. The victor's score was 1053 out of a possible 1250. Company F came second, with a score of 1011. A picture of the beautiful prize is printed in this issue of HARPER'S WEEKLY. The arrangement is that it shall be shot for in the armory during a contest extended through two weeks of every January by teams of twenty-five men selected from the companies respectively. The winning company is to enjoy the honor of possession of the prize until the next tournament. The general and enthusiastic interest taken by the regiment in the late match indicates that the gift will prove a valuable stimulus to increased skill on the part of all the members.

The trophy is a silver and gold horn of rare and peculiar workmanship. Only three cups of the same design are in existence. One is in the possession of the Duke of Oldenburg, by whose name all three are known; another is in Rosenberg Castle; while the third has found its way hither from Copenhagen, having probably been purchased, according to the statement of the United States Consul at that city, just in time to prevent its passing into the hands of the Czar of Russia. The price paid for it was 4400 Danish crowns—about $1100. The donor, Mr. Edward Kemp, of the firm of Lanman & Kemp, of this city, is an old member of the Seventh Regiment, having joined it thirty-five years ago, and served in it long and faithfully. Though no longer an active militia man, he is one of the trustees of the armory fund, and retains a warm interest in the organization—a fact well testified to by his gift.

The horn stands in a glass case on an ebony pedestal. It is about fourteen inches high, has a silver body overlaid with gold ornamentation, which is judiciously relieved by colored enamel. The work is very elaborate, and is said to have occupied the goldsmith who executed it nearly five years. The general design is that of a mediæval stronghold. It abounds in battlements and turrets, gold figures of knights in armor—some of whom are on horseback—ladies with musical instruments, attendants, etc.; spaces otherwise unoccupied are filled in with representations of dragons and other fabulous beasts, coats of arms, and inscriptions in German text, one of which is an invitation to empty the horn. The multiplicity of its details suggests the Milan Cathedral. The whole is thoroughly expressive of the age of chivalry. The Seventh Regiment has a capacious and finely equipped armory, befitting the high character of the organization, but the most attractive object now in it is this German drinking-horn.

THE TORPEDO-BOAT "CUSHING."

IT was a happy thought which gave the name of *Cushing* to the first sea-going torpedo-boat of our new navy. The brilliant achievements of that young officer in the war of the rebellion asserted practically, and for the first time, the value of the weapon, and to this day Cushing's deeds are quoted as the last word by those enthusiasts who declare with Gabriel Charmes and Admiral Aube that "a squadron attacked by a torpedo-boat is a squadron lost," and that for evermore "the microbe will destroy the giant." But fortunately for amiable sailors who prefer square up-and-down fighting (yard-arm to yard-arm or turret to turret) to being hoisted with petards engineered by scientists from a safe distance, these boats were found to have issued in an idleness begot of inexperience; and at present the type—like the ram, the automobile torpedo, the submarine boat, the rapid-fire and machine gun—falls into its class as an auxiliary and not the essential of sea-fighting.

This classification did not result from any jump at conclusions, for the enthusiasm of individuals spurred admiralties into such a gallop of experiment that the type was afforded more than an average chance. In the end, however, the torpedoists had to abandon the idea that any boat, even as an auxiliary, could be made a perfect instrument, and so they were grouped into two classes, which were differentiated by demands of speed, offensive power, coal endurance, and habitability. The first list embraced such as could keep the sea independently; the second, those that could be carried on shipboard and be launched when occasion demanded. In the earlier boats of the first class, to which broadly the *Cushing* belongs, dimensions and strength were so much sacrificed to speed that their history is a record of failure and repairs. The second-class boats could not carry coal enough to operate at any distance from their base, and were forced, like spinsters' cats, to scurry homeward whenever anything but the smoothest weather was experienced. But, with all their faults, the idea was too good to be scouted, and experts agree that boats capable of keeping the sea in all weathers with reasonable safety and comfort will be invaluable aids to sea warfare. As a minimum, the length is to be 130 feet, and the displacement 100 tons.

Notwithstanding this expert uncertainty, the last administration submitted the plans of a first-class boat to home competition. The Herreshoff Company received the contract, and on January 23d the *Cushing* was launched. The new boat is of the twin-screw, deep-sea type, and has the following dimensions: length, 138 feet; depth, 10 feet; breadth, 14 feet 6 inches; mean draught, 3 feet 7 inches; displacement, 90 tons. The boilers are semi-tubular; the engines are five-cylindered, quadruple-expansioned, and the estimated horse-power is 1600. The trial will be a run for three consecutive hours with a weight on board of 15 tons. A bonus of $1500 is added to the contract price of $82,750 if the mean speed exceeds 22 knots, but should this fall below that rate, a penalty of $1000 is exacted; if 20 knots are not attained, the boat may be rejected. But as an incentive, upon which we may congratulate Mr. Herreshoff at once, $2000 is to be paid for each quarter of a knot above 23 knots. The armament is not as yet definitely settled, but it will probably consist of three torpedo-tubes and three rapid-fire guns. There are 11 water-tight compartments, the sides are coal-protected, the interior is electrically lighted, and the two conning towers carry search lights.

The vessel was built under the supervision of Commander Converse, United States navy, and the command has been given to Lieutenant Cameron Winslow. Her performances will be watched with the greatest interest, because, as emphasized in these columns last July, there is, in the great problem of coast defence, no other country to which, from geographical opportunities, torpedo boats can be of such paramount importance.

J. D. J. K.

STRUCK GAS.

NOT only have the two gentlemen shown in the illustration on page 108 as trying to remove their drilling tools from the well that has suddenly proved itself a "roarer" struck gas, but the whole world has struck it. That is to say, the rapid and successful utilization of natural gas within the past few years has convinced the world of the vast superiority of gaseous over solid fuel for both manufacturing and domestic purposes.

That the supply of gas stored beneath the earth's surface is limited, and will ultimately be exhausted, does not admit of question. How long will the supply last is the only subject for argument. Still, whether it comes to an end soon or later, natural gas has already performed an invaluable service for mankind, and taught the world a lesson it will not forget.

That those who have used a gaseous fuel would not willingly return to a solid is established beyond doubt; and that, with the failure of natural gas, they will demand an artificial substitute, is equally certain. In view of this, experiments directed toward the artificial production of cheap gas are now being conducted in many directions. They are backed by generous capital, and have already attained such a degree of success as to enable consumers to anticipate the exhaustion of their natural supplies without anxiety. The artificial gas men are even beginning to advance the claim of those who manufacture ice, that they can do the work more economically than nature herself.

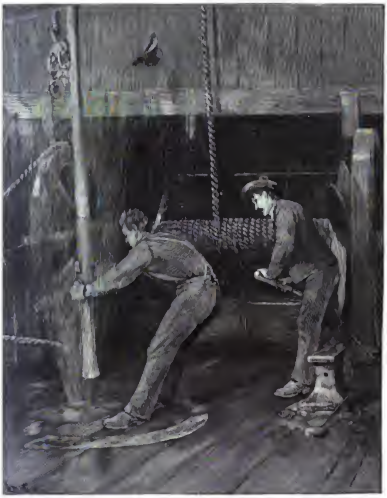
Natural gas is no new thing. For untold ages its burning springs have attracted the fear, the adoration, or the curiosity of all countries. In our own, it periodically accumulates in certain localities just beneath the surface of the ground in such quantities as to cause eruptions similar to those of volcanoes. In fact these outbursts receive the name of "gas volcanoes."

As early as 1821 natural gas was used to illuminate the village of Fredonia, in western New York, and in a small light-house on Lake Erie. In 1841 gas was struck in boring for a salt well in the Kanawha Valley, West Virginia, and when salt-water was also found, the gas was utilized as a fuel under the evaporating pans. Although this is the first recorded use of the new fuel in this country, it had been discovered and allowed to go to waste in a well bored within the present limits of Charleston, West Virginia, as early as 1815.

Gas is almost always found in connection with petroleum, and since 1859, when the first oil well was bored in Pennsylvania, it has been used to light and heat the towns and villages of the oil region. It is the fuel that heats the boilers of the drilling engines at the oil wells, and its pressure is often sufficient to enable it even to supplant steam in the cylinders of these engines. Until recently, however, the great volume of this invaluable product has been allowed to burn or flow to waste, in some cases at the rate of millions of cubic feet per day from a single well.

The first use of gas as a fuel in iron-making was at the Leechburg (Pennsylvania) works of Messrs. Rogers & Burchfield, in 1874, while the glass-makers did not adopt it until 1883. In 1875 it was piped to Spang, Chalfant, & Co.'s iron-works near Pittsburgh; but it was not until 1883, with the introduction of gas from the great Murrysville district, that its use as a fuel in Pittsburgh assumed any importance. To-day it is almost the only fuel used there. The pall of smoke that so dominated the city for nearly a century that it had become a by-word and a reproach has disappeared forever; and the blessed sunlight now finds its way into nooks and corners where its very existence was once unknown. The only smoke now to be seen over the city comes from the tall chimneys of its river steamers and from its locomotives. Even these latter are in many instances being converted into gas burners, the fuel being carried in storage tanks that take the place of tenders.

The comfort and economy of time and labor in the use of a gaseous fuel, as compared with coal, are incalculable and almost beyond belief. There is no hauling and storing of coal; no feeding the furnace, [illegible] out and disposing of the



"STRUCK GAS"—Drawn by J. W. Beatty.—[See Page 107.]

Louisiana, Missouri, Iowa, Colorado, Dakota, Utah, Wyoming, and California.

The process of boring for gas and sinking a well is precisely the same as that for oil, and the cost is equally great. It takes from two to six thousand dollars to put down a gas well, according to the depth required and the material gone through. The depth varies from a few hundred to two thousand feet; and in most cases the deeper the well, the stronger and more permanent will be the flow of gas.

When a location has been decided upon and cleared, a derrick forty to sixty feet high is erected, and a wrought-iron eight-inch pipe is driven down through the earth until it reaches the rock, at any depth from thirty to a hundred feet. Then the great drills, weighing about three thousand pounds, are set to work. These are lifted and allowed to drop four or five feet with each stroke, and are constantly turned, so that the hole may be perfectly round and true. A diameter of eight inches is maintained to a depth of about five hundred feet, and to this depth an iron casing of that size is put down, so as to shut off the water. From this point to the required depth of the well a six-inch hole is bored, and into it a four-inch pipe is inserted.

The gas usually manifests its presence and gives warning of the vicinity of a reservoir by escaping in small quantities and finding its way up through the well long before the drilling is finished. Sometimes, though, no such warning is given. The drill is quietly thumping away; one man is sleepily turning the "temper screw," while the other sharpens the tools, works the "bull-wheel" lever, or makes himself generally useful. They have been thus monotonously employed for fifty or sixty days, perhaps, and are beginning to wonder when their "tower" (tour) of work on this well will be completed. Suddenly the drill rope slackens, the heavy tools no longer strike bottom, but begin to come up out of the well, as though they were of wood buoyantly rising on top of a column of water. The slack of the rope is reeled in on the bull-wheel shaft as rapidly as possible; but before the tools reach the surface the gas rushes forth in a blue cloud, with a deafening roar that can be heard for miles. The drillers hasten to remove their tools, and with that their work is ended. They have struck gas.

umph of the American experiment in government.

The centennial of the organization of the court was observed with appropriate ceremonies at the place of its birth, on Tuesday, the 4th of February, 1890. The Association of the Bar of the City of New York, the New York State Bar Association, and the American Bar Association united in the celebration. The Chief-Justice and the Associate Justices of the court, the President and his cabinet, and the Judiciary Committees of both Houses of Congress, were present, as well as some of the Judges of the highest appellate courts of the various States.

The occasion was one calling for the attention of the entire people. Every American citizen should be reminded by it of the debt which we owe to the judicial department of our national government. This is not merely a debt of sentimental gratitude and admiration, but an obligation calling for present payment, in effective legislation to relieve the court from the overwhelming pressure of duties beyond the power of man to accomplish.

The constitutional provisions relating to the Supreme Court would give a reader not familiar with the history of their application and development but little idea of the extent and importance of the court's power and duties. The Constitution provides that "the judicial power of the United States shall be vested in one supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish," and that "the judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States; between a State and citizens of another State; between citizens of different States; between citizens of the same State claiming lands under grants of different States; and between a State, or the citizens thereof, and foreign states, citizens or subjects."

That is all. They are to try lawsuits between litigants; to pass upon contracts; to determine property rights and claims to damages for private wrongs. There is no hint of political power, no suggestion that the Federal courts are to exercise any different functions than those exercised from time immemorial in Great Britain. Professor

tempted usurpation of power by national or State legislatures has become ineffective, and each has been confined within its proper limits. Hamilton said of the old Confederation, "The treaties of the United States under the present Constitution are liable to the infractions of thirteen different legislatures, and as many different courts of final jurisdiction acting under the authority of those legislatures. The faith, the reputation, the peace, of the whole Union are thus continually at the mercy of the prejudices, the passions, and the interests of every member of which it is composed. Is it possible that foreign nations either respect or confide in such a government? Is it possible that the people of America will longer consent to trust their honor, their happiness, their safety, on so precarious a foundation?" Our avoidance of these evils, and the discord and disruption which would follow them, are due to the existence of the Supreme Court, constantly and consistently declaring and enforcing the limitations of constitutional authority.

It seems marvellous—or it would seem so were it not that daily use robs it of strangeness—that two separate governments, each sovereign within its own sphere, each having a separate and independent legislative, executive, and judicial establishment, should at the same time rule in the same territory without clashing, discord, or conflict. It indicates a wonderful perfection and adjustment of governmental machinery. We have forty-two different States, comprising over sixty millions of people. They present a great variety of climate, productions, occupations, interests, origin, and traditions. Everywhere the right of local self-government is firmly established and vigorously maintained. In each State are separate laws, separate legislatures, judges, and executives. In each State the laws and the machinery of administration differ from the laws and machinery of administration in all the other forty-one States. Yet in all there is found one Federal law, one Federal judiciary, one Federal executive, governing and coexisting with the State government effectively and harmoniously. To the accomplishment of this miracle we owe the perpetuity of our republic, and for its accomplishment we may chiefly thank the Supreme Court of the United States.

Fortunately for the American people, a worthy finisher of the work of Washington and Hamilton and Madison was found during the early days of the republic in Chief Justice Marshall. He presided over the Supreme Court from 1801

may be attributed to the unlimited authority of the majority, which may at some future time urge the minorities to desperation, and oblige them to have recourse to physical force. Anarchy will then be the result, but it will have been brought about by despotism."

The American people, in the constitutional provisions above quoted, have established a safeguard against the possibility of their own injustice, by declaring certain great principles of justice as a law to themselves, and by incapacitating themselves from breaking this law, except through so long and general a course of constitutional amendment as to make it certain that in the mean time passion will have cooled and principle will have reasserted itself. It is the expedient of Ulysses, who had himself bound to the mast until he should be beyond the sound of the sirens' song. But a declaration of principles is ineffective except as it is interpreted, applied, and enforced by the courts. And it is the glory of the Supreme Court that it has given to this part of the Constitution, which otherwise might have been but a rhetorical flourish, the living force and power of an accepted and respected rule of action. It is chiefly due to the commanding authority and leadership of that court that to-day every bill introduced into Congress, or into any Legislature of any State, is before its passage submitted to the most rigorous test of conformity to the great principles of natural justice declared in the Constitution and essential to the preservation of free government; and that American majorities have learned to see with composure and submission their own wishes frustrated when declared to be in conflict with those principles, no matter what may be the prejudices and the passions of the hour.

This method of restraining the dangerous tendencies of democracy by the declaration of great principles, under the form of constitutional limitations, enforced by an independent judiciary, is the chief contribution which America has made to political science. It is the feature which more than any other—more than all others, in our system, claims the admiration of political thinkers. It is the chief occasion of the gratitude which we owe to the Supreme Court of the United States, and its maintenance and protection at the hands of that Court should be the subject of especial solicitude in our future. Not the tumultuous expression of prejudice and passion to-day or to-morrow, as to particular measures or particular

of an intermediate Court of Appeal in each circuit, to review the judgments of the present Circuit and District courts and would limit the right of appeal to the Supreme Court from this new tribunal substantially to cases of large amounts or special importance, and to those of purely Federal cognizance, such as cases arising under the Constitution and laws of the United States, and under its admiralty jurisdiction. This plan was embodied in a bill introduced in the Senate by David Davis, and in the House by Mr Payson, of Illinois, and also in a somewhat similar bill introduced in the House by Mr M'Cook, of New York, and said to have been prepared by Judge Blatchford and Judge Benedict. Lawyers and legislators are divided as to the merits of these plans and of the various modifications which have been suggested. As a natural result nothing has been done. Nothing probably will be done until aroused public opinion supplies Congress with the force to overcome the obstacle of simple indecision.

I have thus dwelt at considerable length upon the vital importance of the Supreme Court decisions upon constitutional questions, because it gives point to another and paramount reason for prompt and effective action by Congress. There are several branches of the court's jurisdiction which are of very little public importance. In most cases between citizens of different States the controversy might as well be determined by the courts of the States themselves. The Philadelphia Law Association in 1883 examined, and tabulated with reference to the grounds of jurisdiction, 729 cases, comprised in the Supreme Court reports from volume 99 to 105 inclusive, and they estimated that in 266 cases—over thirty-four per cent. of the whole number—the Federal courts took jurisdiction upon the ground of citizenship only—that is to say, the Supreme Court was required to hear the case solely because the plaintiff lived in one State or country, and the defendant in another. It is probable that in not more than an insignificant fraction of these 266 cases would there have been the slightest prejudice or failure of justice if the suits had been tried in the State courts. Most of the cases were from New York, Pennsylvania, and Illinois. There is not the least ground for the supposition that the citizens of all those States do not stand upon an equal footing in the courts of each. With rare exceptions, it is of no public importance whatever that such cases should be heard in the Federal courts.

from the unfair pressure of more work than can be done, and we must prevent them from being engrossed, perforce, by the mass of common litigation. We must see to it that they are not kept discussing tithes of mint, anise, and cummin to the exclusion of the weightier matters of the law.

ELIHU ROOT.

A FANCY.

Once, wandering o'er untrodden fields,
Far from the bustle of the town,
Bound by the spell which fancy wields,
I climbed a hill, and looking down,
Saw, in the valley far beneath,
A darksome wood, where oak-trees tall
Swayed in the south wind's gentle breath,
As throbbing bosoms rise and fall.

But when I reached the vale, alas!
And on the very border stood,
A mighty hedge I could not pass
Grew all about the tempting wood.
I caught within the golden ray
Of buttercups. The rippling trill
Of brooks and fountains in their play
With bird-songs seemed the wood to fill.

And, as I listened, on the wind
There came a voice, as one who sings:
"Oh, mortal, leave the world behind,
And scale the hedge on fancy's wings.
Be bold; thou standest on the edge
Of that enchanted fairy-land.
Thy doubts have raised the mighty hedge.
'Twill vanish now at thy command."

I sighed, as one who doubts his dream.
I saw the thorny hedge grow less;
And fainter grew the mystic gleam;
The hedge passed into nothingness.
The mist of eventide arose,
Within a barren vale I stood.
The day was sinking to its close—
There was no dim enchanted wood.

FLAVEL SCOTT MINES.

COLUMBIA COLLEGE.

The installation of the Hon. Seth Low as President of Columbia College took place on the morning of Monday, February 3d, at the Metropolitan Opera-house. The audience which filled this great theatre was one of the most distinguished companies ever brought together in New York. Presidents and professors of the leading colleges and universities, representatives of the National and State governments, and men and women eminent in the professions and society of the country, beheld with the greatest interest an event so liberal in its pledges of future benefits to the public through the cause of education.

The exercises were opened with prayer by the Rev. Dr. Cornelius R. Duffie, the chaplain of the college, after which the Rev. Morgan Dix, S.T.D., D.C.L., addressed the President-elect on behalf of the trustees. The installation address was made by the Hon. Hamilton Fish, the venerable chairman of the Board of Trustees. On behalf of the faculties, Professor Henry Drisler, who, since the death of the late President, Dr. Barnard, has been the acting President, welcomed Mr. Low to his work as the President of the college; and Frederick Coudert, LL.D., presented the felicitations of the alumni. To these distinguished men the new President made in turn brief but appropriate replies; and having received the keys of office, he then delivered his formal inaugural address. The benediction was pronounced by the Rt. Rev. Henry C. Potter, D.D., LL.D., Bishop of New York.

The friends of the higher education in this city will unite with the immediate constituency of Columbia College in believing that the ceremonies of this day, while marking no revolution in the policy of the institution, do signalize the beginning of an era of far greater prosperity and larger usefulness than the college has ever yet attained. The omens attending Mr. Low's induction—the universal respect for the man, the high esteem which his business life and his eminent public service have won from the community, the cordial loyalty of the college to him, as well as his own vigor and enthusiasm, and the open-mindedness with which he assumes the office—are all of the happiest character. His addresses at the installation were eagerly awaited by many who hoped that he would outline a "policy" with regard to the future development of the college. In a noteworthy passage of his reply to Dr. Drisler, the representative of the faculties, he declared his intention to be the President of all the departments of the college, and his opposition to any plan of reorganization which should do away, as has been proposed, with the academic department—the School of Arts:

"The faculties will appreciate that as to the technical side of their work I must be for a long time a learner. I do, indeed, bring to your counsels two new and different points of view, both of which may be valuable in the work we shall have to do together. I shall bring into your meetings the experience of a man of affairs, and the point of view of the trustees. I appreciate thoroughly the importance of the questions that are awaiting the new order of things for determination. You will not expect me to-day to outline a policy. Were I to have a policy, under existing conditions, it would seem an evidence of unfitness for my post. Two points appear to me essential to the securing of the best results. We must conceive of the college as a single institution. In my view, its various schools are as much integral parts of the college as the undergraduate department itself. This suggestion is entirely consistent, in my mind, with a belief that the School of Arts, the historic side of the college, is the foundation of the whole. I believe in doing better than ever, if we can, the work that the college has been doing from the beginning. But I see no reason why this should not be so done as to co-operate with the different schools in the work which they propose to do. Whatever can be made to grow out of the old root I should expect to be strong and sound. But I do not believe in destroying the old foundation in order to rest a new structure upon an uncertain base. While I say this, I am in entire sympathy with the desire to see the college continue its development into a complete university, adapted to the largest possible service to American needs. I hold myself open to conviction as to all details."

In his inaugural address Mr. Low discussed broadly and at length the relations between the college and the city. Starting with the proposition that "there is no such thing as the world of letters apart from the world of men," he claimed for the city a unique and indispensable part in the best university education. It was fitting that Mr. Low, who has given so large a portion of his life to the study of the social and political questions of city life, should say: "An education in New York is likely to be of special value to any man who wishes to be of especial service in meeting the great problems with which our cities confront the country. To him the atmosphere of the city will be a familiar thing, and he will know, if he is a wise man, that though the powers of evil in a city are great, the powers of good are greater. Some men, as they recognize how far short the city falls in a thousand ways of what it ought to be, and see the difficulties attending all efforts at improvement, are apt to say: 'It is no use. Let us eat and drink, and after us come the deluge.' But let it not be so with you. No more spirit-stirring call ever sounded in the ears of a generation of young men than comes to the youth of New York and America in connection with the problems of this mighty city. Splendid beyond imagination in what it may be made to be, it grieves our pride and shocks our love so frequently in what it is. Columbia may bring to you all the learning of the ages, she may surround you with all the opportunities and privileges which the times will supply, but she will fail of her truest and best work if she does not send you forth into the community earnest and patriotic men.... All this, I think, the city means to the college. Let me consider now what the college means to the city. The value of the college to New York is not to be measured by the services of her conspicuous sons. Her chief and permanent value to the city lies in the constant witness she bears to the usefulness and nobility of the intellectual life, and in the work she is always doing to develop and uplift that life. Columbia College, college and university both, as she really is, holds aloft this ideal in the great city where finance and commerce show alike their good and their bad sides. In her financial management she exhibits a business trust faithfully administered without a breach for 130 years. On her educational side, she displays the splendid usefulness of money, which is received not to be hoarded, but to be well spent. She is profoundly conscious that what she is doing is but the earnest of what she may do, if New York will but make common cause with her, and enlarge and broaden and deepen her work on every side."

WHEN EVEN COMETH ON.

The mother-heart doth yearn at eventide,
And wheresoe'er the straying ones may roam,
When even cometh on they all fare home.
'Neath feathered sheltering the brood doth hide;
In eager flight the birds wing to their nest,
While happy lambs and children miss the sun,
And to the folds do hurtle one by one.
As night doth gather slowly in the West,
All ye who hurry through life's busy day
Hark to the greeting which the ages tell,
"The sun doth rise and set. Hail, and farewell!"
But comfort ye your hearts where'er ye stray,
For those who through this little day do roam,
When even cometh on shall all fare home.

LUCY E. TILLEY.

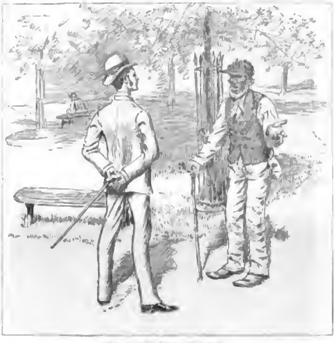
THE WATER-COLOR EXHIBITION.

Twenty-three years have passed since the formation of what is known as the American Water-color Society. The organization then was a feeble one. Its first exhibition took place in the following year, and the progress which painting in water-colors has made since that time is well illustrated by the 645 works that are now shown at the Academy of Design, and that constitute the twenty-third annual exhibition of the Society. To those who remember the early displays made by the organization, the high average excellence, as well as the wide variety of the works now on view, is very significant, as measuring the advance that has taken place in the aims and the methods of American workers in this medium. Indeed, as compared with the work that found favor even a few years ago, that which is to be seen at the Academy to-day shows an average degree of improvement that is not realized without recalling the past. The progress has been so gradual that it is not easily estimated, but it nevertheless exists.

There are 297 names of contributors in the catalogue this season, and it is interesting to notice in how wide a range of country their habitations are to be found. The usual variety of landscapes, figure pieces, portraits, and marines is offered to suit the taste of expected purchasers. Of the welcome visitors, the people who come to admire and remain to purchase, a greater number are usually found among the frequenters of water-color exhibitions than at the regular displays of painters in oils. There are several reasons for this. The attractive character both of the subjects and the methods of treatment, and the comparatively moderate prices at which water-colors are sold, commend them to the average picture buyer. Besides this, the aspect of the exhibition is decidedly a cheerful one, and is perhaps stimulating to the purchaser.

The absence of the Department of Etchings which has heretofore been a prominent feature of the water-color exhibitions, gives more space for the legitimate purposes of the display this year, and confines it to the galleries, without trespassing on the corridor. Of landscapes there is an excellent display, and not only are the familiar names well represented, but some new men are coming forward whose productions are highly creditable. The general tendency of workers in water-color is toward landscape, and the beginner as well as the veteran is apt to choose hill and valley and forest for subjects rather than figures. Yet the latter are not neglected. Our illustrations give some examples of excellent work from both these classes of artists. In Mr. Samuel Colman's "Looking across Country," we have a coast scene painted with charming simplicity and directness, and Mr. Jervis McEntee's "Northern Winter" suggests the delicate sentiment which so often distinguishes his work. "A Quiet Place with Ducks" is the joint production of Mr. N. Bastert and Mr. George Poggenbeek. It shows a bit of marshy country in Holland, and the work of both artists is highly creditable. Mr. C. Harry Eaton's "A Lowland River" has qualities that justify high praise. The foliage and the green banks of the placid stream are extremely well painted. Mr. J. Francis Murphy is at his best in his pensive version of nature as set forth in his "Willows," and Mr. J. S. H. Kévér shows the best results of the Dutch school of water-colorists in a charming picture, "A Warm Day." The rich tints of Mr. Leonard Ochtman's "Woodland" will attract the visitor, and Mr. Horatio Walker's beautifully luminous "Evening" is one of the most satisfactory works in the exhibition.

The figure-painters, although not numerous, make an excellent showing this year in the exhibition. Mr. George W. Maynard's "Mermaids and Mariners" is painted with a sure and skilful hand. The freedom, buoyancy, and suppleness of the half-seen figures of the mermaids gliding through the water, and the coloring, delicate but strong, are not marred by any shortcomings. "The Heyday of Youth" is one of Mr. William Magrath's carefully drawn compositions. The figure of the dancing girl is excellent. Mr. Clark Crum's "Foster-Mother" is the work of a promising artist who is one of the many new-comers



THE EASIEST WAY'S THE BEST.

SHAREHOLDERS SUFFER.

the week now closing additional proof furnished of the undesirability of the tion of power in the management of a on. In no case have the results been ry where an individual or a compara- all number of persons have usurped the at are conferred upon and intended to sed by a larger number. In the case er consideration, namely, that of the tional Bank of this city, the President, nership of a bare majority of the stock titution, has jeopardized deposits aggre- er two million dollars, as well as the of his fellow-shareholders in the con- was tempted to do this by an offer of tant price for his shares, and though his ent of the bank during a long term of l been conservative and successful, he this temptation, and by so doing ad- gang of thieves to the vaults of the s forthwith proceeded to plunder it. ancial situation has, most fortunately, seriously disturbed by the discovery and of the fraudulent operations that cul- in the control of the Sixth National the most audacious adventurers that ntly demanded the attention of the pub- utor. Those operations have, neverthe- same effect upon confidence not only in dry, but abroad as well. They have the improvement in the stock market noted in this column last week, and e still in progress when the entirely un- disclosures were made. Those dealers ties who habitually favor lower prices made all the capital they could out of al looting of the Sixth National, but accomplishing more than to emphasize e that was naturally due in the market also

nerally argued in Wall Street that the ferred to should not have more than a ffect upon Stock Exchange values, since ity is circumscribed, and the chief suf- l probably be the wealthy but avari- President of the bank, and possibly the ckholders, whose interests he betrayed. a broader view than this, which takes uties of a corporate officer, especially himself controls, by ownership or other- property that he is employed to man- orcement of the National Banking Law those deal very seriously with ex-Presi- und for his unbusinesslike, not to say abandonment of his bank, in order to s personal estate. It is to be regretted laws governing other corporations are not so stringent in their provisions for the protection of creditors and stockholders, and that, so far as they go, they are not as readily enforced as the National Banking Act, under which an office is established and maintained, namely, the Comptrollership of the Currency, the functions of which are the enforcement of the law.

The principle upon which a corporation is founded is indicated in the term itself, and the purpose the State has in view in granting extraordinary powers and privileges to a company is to secure to its citizens the benefits that can best be secured by their co-operation in various industries and undertakings. The moment that the principle of co-operation in its fullest sense is abandoned, or rather when the powers conferred are relinquished through negligence to one or two persons, or secured by them by design, trouble invariably results, and disaster to the enterprise is almost certain to follow. The temptations to abuse that power are great; and as long as human nature is constituted as it is, the number of men who can resist them is exceedingly small. Yet, in spite of repeated experiences that should make all that we are now saying seem very trite, hardly a day passes that does not furnish fresh evidence of the unwisdom of surrendering to a few the rights that should be exercised by many.

Of course every enterprise of sufficient magnitude, or of a character to require co-operation, must have a head, but under no circumstances should the head be permitted to usurp the functions of the entire body. When that occurs, confidence is sure to suffer. The ideal executive of a corporation should seek to stimulate interest and activity on the part of his associates, no matter how small their share in the enterprise may be. The practice too frequently is to take advantage of their apathy and to ignore their claims. The most signal and disastrous example of the virtual substitution of an individual for a corporation was furnished in the histories of the Northern Pacific and Oregon Companies in 1883. Within the memory of the present generation the violation of the principle under discussion extends back to the Gould-Fisk scandals in the management of the Erie Company. As before noted, the list is a long one, for it seems that in respect to these matters experience teaches nothing. A year ago this time there was a partial awakening of the stockholders of the Granger Trunk Lines that was brought about by the disastrous overbuilding of railroads, and consequent rate wars in the region west of Chicago and St. Louis and east of the Rocky Mountains. The sentiment then aroused was utilized by the larger dealers in railways and their securities, and the taste of power that they then enjoyed for the first time seems to have developed an appetite for it.

It was quite proper that the banking interest, which is responsible for the distribution of the securities of railway companies, should champion the cause of the purchasers of those securities when their property is seriously endangered, as it was in the year 1888. But the action of the Voting Trustees of the Philadelphia and Reading Railroad Company in supporting unqualifiedly the present management of that company, and the efforts of the reorganizers of the Atchison, Topeka, and Santa Fe Railroad Company to secure to its creditors the control of that system for a term of years without any adequate consideration to the stockholders, who made all the sacrifices in the reorganization, demonstrate that even the most successful and presumably most conscientious champions of security holders are capable of errors of judgment. There is only one remedy for the conditions that investors have so frequently had occasion to deplore; it is a more enlightened self-interest on the part of every shareholder in every corporation, for eternal vigilance is the price of wealth as well as of liberty.

Collin Armstrong.

New York, Saturday, *February* 1, 1890.

A HAUNTED HOUSE.

This body of ours has been likened to a tenement. It often has a haunted apartment—the stomach. Scared by the eldrich sprite, dyspepsia, digestion flies and refuses to return. What can break the spell, what can raise the ban laid upon the unhappy organs? We answer unhesitatingly, Hostetter's Stomach Bitters, and we are warranted in the response by the recorded testimony of myriads, covering a period of over a third of a century. A course of the Bitters, begun in any stage of the affliction, and persistently followed, will terminate in cure positive, not partial. The Bitters restores tone to the epigastric nerve, renews and purifies the juices exuding from the cellular tissue that act upon the food digestively, expels bile from the stomach and the blood, and promotes a regular habit of body. Malaria, kidney complaint, nervousness, rheumatism, and neuralgia give way to this medicine.—[*Adv.*]

IMPERIAL GRANUM

Is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

"BROWN'S BRONCHIAL TROCHES."

For Bronchial, Asthmatic, and Pulmonary Complaints, "Brown's Bronchial Troches" have remarkable curative properties. 25c. a box.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.—

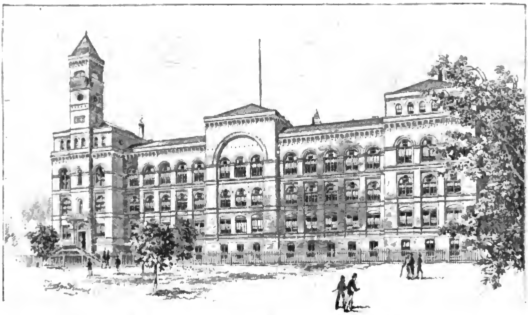
HARPER & BROTHERS, New York.

HOW UNCLE SAM MAKES HIS PAPER-MONEY.

BY FRANKLIN P. SMITH.

THE handsome building of brick and iron on the corner of Fourteenth and B streets, in the city of Washington, known as the Bureau of Engraving and Printing, owes its origin to the civil war. Although it was not built until many years after that struggle, the work now going on under its roof was forced upon the government in the autumn of 1862. Previous to this date the issues of paper-money were engraved and printed by private bank-note companies in New York city. They were shipped to Washington in sheets of four notes each. After being signed by the Treasurer of the United States and the Register of the Treasury, they were trimmed and cut up, or separated, by women with long sharp shears. So slow, laborious, and expensive was the work, that Secretary Chase gave orders that it should be done by machinery. On the 29th of August, 1862, Mr. Spencer M. Clark, then Chief Clerk of the Bureau of Construction, to whom he intrusted the execution of these orders, had procured and set up in the basement of the Treasury the presses for printing the engraved signatures of the Treasurer and Register, and the trimmers and separators for making the notes ready for circulation. From this humble beginning has expanded one of the most interesting and important branches of the Federal government.



THE BUREAU OF ENGRAVING AND PRINTING, WASHINGTON, D.C.

Under Mr. Clark's energetic and efficient management the bureau was a success from the first. Overcoming the great opposition that he encountered from the private bank-note companies, he constantly enlarged the operations of the establishment. It was but a step from printing the signatures on the notes to printing the notes themselves. The further step of engraving the plates in the Treasury, instead of intrusting the work to private enterprise, was easily and naturally taken. In a few months the government owned a completely equipped engraving and printing establishment, having its own engravers and printers, and its own stock of dies, rolls, and plates for the production of every form of security. Although the bureau never failed to justify its existence by turning out work much cheaper than the bank-note companies, the policy of sharing with them the preparation of the paper issues prevailed for many years. Greater security was believed to come from having the bank-note companies engrave and print the backs, while the bureau engraved the faces. Whether justified or not by experience, the policy was finally abandoned.

To such a volume did the work of the bureau grow that the quarters in the attic of the Treasury, whither it was transferred from the basement, became entirely inadequate. During the administration of Mr. Clark he proposed that a separate building, to be connected with the Treasury by a subterranean passage, be erected on the ground opposite the Allbaugh Opera-house. It was not, however, until the administration of Mr. Edward McPherson that Congress was induced to make an appropriation for the purpose. With $27,000 for a site, and $300,000 for a building, construction was begun in the autumn of 1878, and completed in the spring of 1880. The bureau was immediately removed to its new quarters, where it now gives employment to more than a thousand people. At the time that Mr. Clark began operations he had only one male and four female assistants. He remained Chief of the Bureau until August 16, 1868. Since then the administration of the institution has been in the hands of George B. McCartee (February 21, 1868, to February 17, 1876); Henry C. Jewell (February 21, 1876, to April 30, 1876); Edward B. McPherson (May 1, 1877, to September 30, 1878); O. H. Irish (October 1, 1878, to January 27, 1883); Truman N. Burrill (March 30, 1883, to May 21, 1885); Edward O. Graves (May 21, 1885, to May 1, 1889); and William M. Meredith, appointed to succeed him.

I.—THE ENGRAVING DIVISION.

The face value of the securities that the bureau produced in whole or in part from the 1st of July, 1869, when annual reports began to be made, to the 30th of June, 1888, is $13,106,606,-631. The amount produced previously would probably bring the aggregate up to nearly twenty billions. How has this vast sum been made?

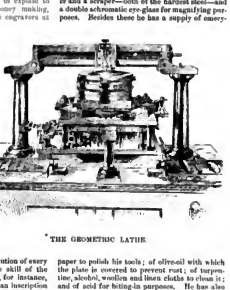
Most people suppose that the method is very simple; that a design is first drawn by an artist, and then engraved on a steel plate, and that from this plate bank-notes are printed. A more erroneous idea of the elaborate and complex processes required to convert a piece of blank paper into a bank-note could hardly be formed. Much time, infinite pains and patience, the highest order of artistic taste and skill, long years of the severest training, and many thousands of dollars in capital are needed to effect the transmutation.

The most important and difficult processes are those connected with the preparation of the steel plates. This work is done in one of the largest and handsomest rooms in the bureau. The engraving division, as it is called, is located on the first floor, and runs east and west nearly the entire length of the building. Its ceilings are lofty, and an abundance of light comes in from the large double windows along the northern side. Standing in the doorway at the eastern end, near the southern side, visitors behold a long and somewhat narrow room pervaded by a silence almost death-like. At the right, seated before a bench divided into sections by green cloth partitions, are eight or ten engravers at work. Further to the west, on the same side, are the transfer presses, with their large wheels turned back and forth by operators that stop from time to time to examine or adjust their work; and beyond them are the plainly furnished offices of the superintendent. To the left, a short distance from the entrance, are the open doors of the great vaults built into the south side of the room. Here, securely kept, are the priceless treasures of the bureau—the dies, rolls, and plates made by the engravers.

These men who are bending over the little pieces of steel under the windows have consecrated their lives to a laborious and exacting art. No form of engraving is so difficult as that of bank-notes. A bank-note engraver may become a wood-engraver—his training makes easy the transition from one art to the other—but the wood-engraver never becomes a bank-note engraver; he is obliged to master almost a new art. The methods and materials of the two arts are entirely different. The wood-engraver produces his efforts by cutting away the wood and leaving the lines in relief. The surface of the block left is slightly inked, and the impression taken is the picture that he has cut. The bank-note engraver pursues exactly the opposite course. He cuts his lines into the steel in intaglio. They are then filled with ink. Whatever is left on the surface of the plate is carefully wiped off, and a sheet of dampened paper is laid on and subjected to heavy pressure. The paper is thus forced down into the lines. When it is taken off, the ink is drawn out, and there is formed on the surface a cast of the engraver's work, readily detected by the touch. The white lines and spaces in the wood-engraving represent the surface that has been cut away; these features in a steel-engraving represent the surface that has been left intact. One consists of white lines on a black background, and the other of black lines on a white background. In wood-engraving every line must have a perceptible thickness, otherwise it will not print; in steel-engraving the finest scratch on the surface of the plate will make a line on the printed sheet.

The origin of this beautiful art is curious. It dates from the middle of the fifteenth century. At that period, in the early youth of modern art, the silversmiths of Florence used to ornament the creations of their genius with engraved work. To bring out the engraving, to make its contrast with the metal more striking, the lines were filled with enamel. If the effect was not the one intended, it was a difficult task to dig out the hardened substance and do the work over again. To provide against such a contingency a sulphur cast of the engraving was taken from a matrix of fine clay, and the lines filled with a black pigment. The effect of the engraving would thus be observed, and any change desired could be readily made, and no injury done to the original work. To some ingenious engraver it occurred to fill the lines of the cast with ink, and to make a copy of the engraving on a sheet of wetted paper. To all intents and purposes this was an example of plate-printing; but the discovery, accidentally made in the pursuit of a different object, was not utilized until a century later.

If the visitors at the door have obtained a special permit from the Chief of the Bureau, they can advance into the room. Accompanied by the guide that has been detailed to explain to them the mysteries of paper-money making, they can look more closely at the engravers at work. They now learn for the first time that no engraver ever cuts the entire plate from which a bank-note is printed. Of the several engravers employed in the bureau, one may be engaged on the design of a new silver certificate; another, on a portrait; another, on the lettering of the inscription; another, on the counters that indicate the denomination of the note; another, on a section of the border, which is never engraved in full; another, on the seal; while others may be putting the finishing touches to plates that are nearly ready to go to the printer. Nothing but this division of labor could secure that perfect execution of every part of a note that so baffles the skill of the counterfeiter. No engraver could, for instance, cut a portrait and the lettering of an inscription with equal excellence. By division of labor, which insures the high character of work that is the chief if not the only protection against counterfeiting, the bureau is enabled to limit materially the time that it would take one engraver to turn out one plate for a bond or a bank-note.



THE GEOMETRIC LATHE

To give an idea of the work of an engraver, let us follow him in the production of a portrait. An account of the mechanical part only of this product of genius can, however, be given. That part dependent upon the taste and skill of the engraver can no more be described than the mental operations that bring forth a fine statue or a great poem. No one can tell (the engraver himself cannot tell) why a line is cut in a certain direction or with a certain curve; why it is made just so much heavier or just so much lighter than it was when first cut. But the secrets that are within the reach of all may be discovered by a study, for instance, of the portrait of Martha Washington on the one-dollar silver certificates.

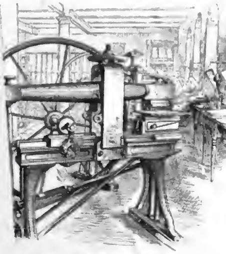
First of all, let it be remarked that the portrait of a living person is never used on government securities. It was prohibited by law many years ago under circumstances not devoid of interest. On the 22d of March, 1866, Mr. Russell Thayer, of Pennsylvania, rose in the House during a debate on an appropriation bill, and offered an amendment to forbid the use of the portraits of living persons on the paper-money issued by the government. "I believe," he said, in explanation, "it is a fact capable of being well authenticated that when the first silver dollar of the United States was struck, it had upon it the image of the greatest of Americans—George Washington. When the fact came to be known to President Washington he ordered that the die be destroyed. Whoever, therefore, has a silver dollar with the head of General Washington upon it has in his numismatic collection a coin of rare value. Sir, the modesty which seems to have distinguished the public men and the public officers of that day does not, I regret to say, seem to characterize all of the public men and public officers of the present day. If I take up now what is the representative of the smallest silver coin of the United States, I find upon it—not only upon one side, but upon both sides of it, lest the people might fail to see it—the effigy not of General Washington, but of the Superintendent of the Public Printing." Although Mr. Thayer should have said the Superintendent of Printing in the Treasury, his allusion to Mr. Clark was unmistakable. While his amendment was not adopted, the fact to which he called attention led later to the passage of the law that effected the change he had in view.

By means of photography the portrait is reduced to the proper size. Upon the copy is placed a sheet of gelatine, and with a fine steel point a tracing is made. The lines of the tracing are filled with vermilion. The gelatine is laid, tracing downward, on a piece of highly polished decarbonized steel of the finest quality, the surface of which, after being cleaned with turpentine and alcohol, has been covered with a thin coating of a kind of varnish known as etching ground. It is rubbed with a burnisher, which causes the outline to be deposited on the varnish. The fine steel point comes into play again to outline the vermilion portrait upon the steel plate itself. The varnish removed, the engraver begins the artistic part of his work.

He seats himself before the section of the bench assigned to him. Just above his head at an angle of thirty degrees is a board covered with green cloth. Over the rectangular aperture in the centre is an adjustable white tissue-paper screen, by means of which the light from the windows may be softened to suit his eyes. In front of him are fixtures for electricity, to be turned on when the day is darkened by clouds or rain. He lays his plate on the leather-covered pad, and with a few simple tools produces a beautiful work of art. They consist of a graver, a steel point, a burnisher and a scraper—both of the hardest steel—and a double achromatic eye-glass for magnifying purposes. Besides these he has a supply of emery-paper to polish his tools; of olive-oil with which the plate is covered to prevent rust; of turpentine, alcohol, woollen and linen cloths to clean it; and of acid for biting-in purposes. He has also an alcohol lamp to heat his plate whenever necessary, a hand-vise to hold it over the flame, and one or two other articles to be mentioned hereafter.

At the end of six weeks or two months his task is finished except the background. If the portrait

None of the dies—as the plates are called as they come finished from the hands of the engraver—is ever printed from. All government securities are printed from the reproductions of the transfer presses in the engraving division. It is safe to say that without these invaluable adjuncts of an engraving establishment the use of the modern bank-note could never have reached its present magnitude. No die could withstand the wear of printing the enormous issues of currency demanded by the governments of the world. The engraving of a sufficient number of duplicates would be so costly as to preclude an extensive manufacture of this invaluable device of trade and finance. But the transfer press renders pos- ble and easy the manufacture of the one or two ndred reproductions of a single die that the te presses of the bureau may be printing from the same time.



THE TRANSFER PRESS.

Before describing it in detail, let us look at designer. His, too, is a difficult task. He is lged about and hampered by the restrictions conventionality. When an order is received n the Treasury for a new note, he is directed get up a design. With proofs of portraits, etter, and other plates in stock before him, roceeds, with infinite patience and trouble, to gn something that shall, in the first place, like money; that shall, in the second place, lfferent from any money that has been print- that shall, in the third place, be pleasing and tic; that shall, in the fourth place, win the oval of the superintendent of the engraving ion, the Chief of the Bureau, and the Secre- of the Treasury. The note to be designed, every other note that has been designed, have an inscription, signatures, counters, ers, and a seal; it may or may not have usually does have) a border or a portrait or notto; it may have any two, or all three. roblem for him to solve is to combine these es, common to all notes, in such a way that w note shall be quite different from them, ill be a good deal like them. When he lved the problem to the satisfaction of ev- ly concerned, and thus earned a reward s will never receive here below, his design n to the transferrer, whose duty it is to as- upon one plate, in accordance with the the various parts of the note that have graved especially for it or selected from ck in the vaults.

first thing that the transferrer has had to take upon a roll the die of each of these A roll is a steel cylinder about three in diameter, and a little wider than the g on the die. Or- -engraving, with its stipple-work and n to secure artistic effects with the would be seriously injured in its pas- a transfer press. The bank-note nnot resort to them. Whatever ar- he imparts to a portrait or vignette with lines alone—with lines in a cer- n or with a certain curvature, with t lines, with broken or continuous lines. The transfer press forbids absolutely any other treatment. In the presence of so heavy a restriction upon genius it can be understood that natural endowment and long years of study and practice are indispensable to a first-class bank-note engraver. Born with the high degree of intelligence and artistic taste and feeling essential to a work of art, he must have, in addition, the moral qualities of courage, endurance, self-denial, and fidelity to a jealous and exacting mistress; he must abandon the hope of wealth, though not of fame, and win that confidence of his fellow-men that will induce them to intrust him with the production of a work of the great possible value of a bank note plate. That bank-note engravers should, as a rule, be men of character is but the inevitable result of the necessities of their art. Only one of the bank-note engravers in this country, I am told, ever brought discredit upon a profession proud of the honor and honesty of its members.

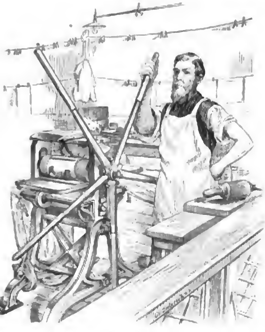
From the bed-piece, on which are assembled in intaglio the various parts of the note, a roll of sufficient width and diameter is taken up, hardened, and used to make the plates for printing. These plates are of the finest steel, highly polished, and large enough to contain four notes, or "subjects," as they are technically termed. Each plate is numbered, and each subject, according to its position on the plate, is lettered twice with one of the first four letters of the alphabet, known as check letters. Under one of the letters, or on some other part of the note, the number of the plate is repeated. An inspection of the letter and number will, therefore, disclose the position of the note on the plate and the number of the plate. The unwary counterfeiter that disregards these apparent trifles, and omits to letter his note, or letters it with some other letter besides A, B, C, or D, brands by omission or commission his work as spurious. Or if he uses a number that never appears on the denomination that he imitates, the fact reveals his dishonest hand. The burr or ridge raised by the heavy pressure of the transfer press around the plate and between each subject is scraped off. The plate is then sent to an engraver, who remedies any defects that he may discover; he cuts more perfectly the sections of the border and the combinations of geometrical lathe-work.

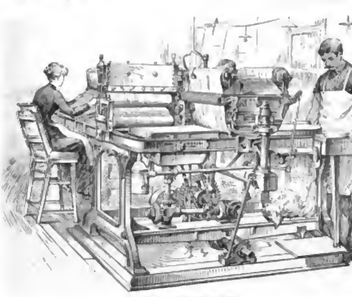
It now goes to the hardening-room, which opens off the engraving room. Here it is prepared by the hardening process for the printing-press; in this room, in fact, all dies, rolls, and plates are carbonized or decarbonized. With its crucibles, blow-pipes, and charcoal furnaces it looks as though it might be the workshop of some old alchemist. In one corner is a large sheet-iron contrivance (resembling the quarter-section of a pyramid) to carry away the smoke from the fires beneath and the fumes from a poisonous drug used to harden plates. Near by is a low, cylindrical iron stove lined with fire-brick. Inside is a small iron pot to contain a quantity of ivory carbon and the rolls or dies to be hardened. At the bottom at equal intervals are four holes, and entering each hole is a gas jet. Air is mingled with the gas, and driven by a bellows with great force against the pot. The chemical action set up by the heat transfers the carbon to the rolls or dies, which, after the lapse of an hour or two, are plunged into cold water. If they are to be decarbonised, some substance like scraps of soft iron, having a stronger affinity for carbon than the steel, is substituted for the ivory carbon, and the application of heat reverses the process.

Plates are hardened in another way. Cakes of cyanuret of potassium, a virulent poison, are melted in the large retorts suspended in the charcoal furnaces, which can be shut off from the rest of the room by sliding doors. The plate to be carbonized is locked in a frame, which is attached to a long iron rod. One of the big muscular men in the room, with sleeves rolled to the shoulders and brow dripping with perspiration, seizes the rod, and plunges the plate into the liquid. Kept there four or five minutes, or until it becomes a silver white, it is removed and cooled, first in a bath of linseed-oil, and finally in a tank of water. Immediately another muscular operative takes the plate from the frame, and laying it on a bench, pours oil and emery on it, and with a brush rubs it vigorously for a few moments. After their removal more oil and a finer kind of polishing sand are applied; it is rubbed vigorously again and wiped off. Thus thoroughly cleaned, it is carried to the proof presses in the engraving-room, and proofs are pulled, which are examined by the engravers. If the engraving is found to be satisfactory, and if the plate is not yet needed for printing purposes, it is returned to the hardening-room to be waxed to protect it against rust. It is then ready for the vaults, where it remains until drawn out for the printer.

There are two vaults, each large enough for a bedroom, one for the dies, rolls, and plates of the national securities, and the other for the dies, rolls, and plates of the national bank-notes, both containing between thirty and forty thousand separate pieces of steel. They have double doors and time locks. No cracksman could enter them in the daytime without discovery by the custodian or his assistants; nor by night, since every room in the bureau is lighted from dark until daylight, and patrolled constantly by watchmen. Having no ventilation, they are never pleasant to be in; in summer they are stifling. The electric lights with which they are illuminated during business hours disclose on every side long narrow spaces for the plates and little drawers for the dies and rolls. In the centre of the vaults are cabinets, in which are kept the plates for surface or ordinary printing. Over each plate and on each box there is a number. In the books of the custodian are recorded the number and a description of every die, roll, and plate in stock, or in the hands of the engravers, transferrers, or printers. Indeed, the moment a piece of steel has on it a mark that can give it the slightest value it is numbered, and must be turned into the vaults at the close of the day's work, and no piece can be withdrawn without a requisition from the superintendent of the engraving division or of the printing division. The requisitions are filed away, so that from an inspection of them and of the books of the custodian the whereabouts of any given die, roll, or plate can be ascertained at any given time. In the morning, in compliance with the requisitions that he has received, the custodian lays out the plates called for by the printing division and the pieces of steel on which the men in the engraving division are at work. Clerks from these divisions verify each number before accepting any die, roll, or plate, to make sure that no error has been committed. For the same reason the custodian verifies, upon their return, the number on every piece of steel delivered to him. Where so much care is exercised mistakes are impossible.



A HAND PRINTING-PRESS.



STEAM PRINTING-PRESS.

What finally becomes of these thousands of pieces of steel? When the days of their usefulness are at an end they are melted up. Every two or three years a destruction committee from the Treasury visits the bureau and examines the contents of the vaults. They bring along with them a set of books containing a record of all the dies, rolls, and plates left in the vaults the time before, and compare their numbers with this record to see that no piece has been lost in the mean while. On loose schedule sheets they note the new work added to the stock since the last examination. After going through the vaults and selecting for destruction the pieces that have become useless, they make a new record of what is left and of the new work, and return it to the Treasury for the next committee. The condemned pieces are thrown into strong boxes, fastened with bands of iron, and carried to the navy-yard. So cautious are the committee that no piece shall be stolen or lost that they will not intrust the boxes to the care of anybody else. They accompany these condemned treasures themselves, take out each piece, and after comparing its number with the schedules in their possession and in the boxes, cast it into a crucible with their own hands. They watch the metal until it melts beyond recognition. More worthless material than this steel after it is cooled can scarcely be imagined. That which has not been moulded for the committee into paper-weights of various designs, which are so hard that they cannot be cut with a file or polished with an emery wheel, is thrown away.

II.—THE PRINTING DIVISION.

Visitors to the bureau are never permitted to wander about its rooms as they like, or to examine whatever takes their fancy. So carefully watched in every avenue, that they cannot step beyond the precincts of the reception-room without being confronted by an inquisitive attendant, and warned that it is against the rules. To guard the operatives from disturbance, no one not having special permission is admitted to inspect the bureau except on Saturday. On that day the general public may visit certain divisions. They meet in the reception-room at the right of the main entrance, and after being divided into small parties, they are escorted to the upper floors, where the rooms are crowded with machinery and operatives, and where the life and activity have more popular interest than the quiet of the engraving-room. Were they to study the method of making paper-money in the natural order, they would first visit the wetting division, for it is here that the blank paper is prepared for the printer.

The Bank of England, as is well known, does not depend for protection against the counterfeiter upon the excellence of the engraving upon its notes, which bear an exceedingly simple design printed from stereotype-plates, but upon the character of its paper, which has a peculiar water-mark and is manufactured in its own mills. When the bureau was first organized, Mr. Clark conceived the idea that a similar distinctive paper, manufactured and used exclusively by the government, would enable the public to detect counterfeits more readily than the ordinary bank-note paper. Although the bureau has never followed the policy of the Bank of England, Mr. Clark, in his testimony before the Garfield investigating Committee in 1864, claimed that his experiments were successful. "Their result was," he said, "the production of a paper interspersed with a fibre of a different color and different material and perfectly insoluble in water. It could," he added, "never be reduced again to pulp. It was like cloth in that respect; you could wash it in hot or cold water, boil a pudding in it, without affecting it. If the national currency had been printed on that, when you wanted to test its genuineness at any time you had only to go to the washbowl and wash it to pieces. If you washed it away, you would put a counterfeit out of existence; and if it was a good note no harm could come to it, but it would simply be cleaned." This paper did not come into general use; but the colored fibres, known as "spider legs," were retained, and form at the present time a distinctive feature of our currency. The paper of the United States and national bank-notes, however, differs somewhat from that of silver certificates; it has, besides the fibre, a silk thread running the length of the note. But each kind, like the water-marked green paper for revenue stamps and the water-marked white paper for checks, is the finest quality of pure linen paper, manufactured from new duck cloth and canvas clippings.

The paper consumed by the bureau during the early years of its existence was manufactured in the basement of the Treasury; but the mill caused so much noise and emitted an odor so disagreeable that it was eventually abolished. The paper on which securities are now printed is manufactured by private concerns, whose mills are vigilantly guarded by government inspectors to prevent loss or theft. After its shipment to Washington it is stored in vaulted rooms in the sub-basement of the Treasury, to be drawn upon requisition whenever an order is given for the printing of any security. It is then sent in packages of a thousand sheets to the wetting division in the upper floor of the L, carefully counted by girls, who see that the requisition has been properly filled, and divided into sections of from ten to forty sheets each. These sections are laid between wet cloths and stacked on the floor. The paper is next shifted—that is, the dry sheets in the centre of the sections are turned toward the cloths and allowed to remain until they too are thoroughly damp. It is then counted a second time, and stored in an adjacent room ready for delivery to the printer.

The large room where the printing is done, and to which most visitors are first taken, occupies the third floor of the bureau. The rattle of the paper and presses, the click of the plates, and the odor and smutches of ink form a striking contrast to the stillness and cleanliness of the engraving division. Every foot of available space is occupied with machinery and the three or four hundred operatives. The printers, in colored shirts, with sleeves rolled to the shoulders, and faces and hands stained with ink, are working with noticeable rapidity and energy; and their assistants, always girls, in well-worn dresses protected by long aprons, are busy removing the printed sheets or moistening and putting on the blank sheets. Some of the men are large and muscular, others are lean and spare; some are young, and others beyond the middle age. The women are of all ages, from sixteen, with rosy cheeks, to sixty, with gray hair. Some of them have very attractive faces, but there are others not so pleasing. In spite of the unfavorable surroundings, the natural taste of the sex for ornament is not suppressed. Here and there may be seen a head elaborately frizzled, or a ruffle about a pretty neck, or above an ink-stained apron the blushing face of a rose.

A closer examination shows that the printers do not all work at the same kind of presses, nor are they all doing the same kind of work. Some are printing the black faces of the notes on the old-fashioned plate press, or the D press, while others are printing the green or brown backs, and still others the various internal revenue stamps on complicated steam-presses. The ordinary plate press, with its long radial handles, called a "spider," is a simple affair. Besides its iron framework, it consists of a plank, also of iron, propelled between two steel rollers thickly covered with felt to soften the pressure. The plate is heated slightly on a gas-stove. The printer seizes a roller, which resembles a rolling-pin, and after rolling it vigorously over an inking table, he rolls it with equal vigor over the plate. The heat and the pressure applied cause the ink to penetrate the deepest line of the engraving. The surface is, of course, covered with a thick coating of ink, which is wiped off with a piece of muslin cloth. In order to clean it perfectly, the printer rubs his hand on a ball of whiting, and polishes the plate with the greatest possible care. This part of his work requires skill and judgment. He must see to it that every particle of ink is removed from the surface of the plate, otherwise it will smutch and spoil the sheet. He must see to it, too, that he does not rub the ink out of the depressed lines, otherwise he will get no impression, or a very imperfect one. This work done to his satisfaction, he transfers the plate to the bed of the press, and upon it his assistant lays a sheet of dampened paper. Grasping the spider with both hands, he forces the bed and the plate between the rollers. The assistant pulls the sheet off, examines it to make sure that it has been properly printed, and lays it on the pile of printed sheets on the shelf at her side. If, however, it does not in her judgment or that of the printer appear to be printed perfectly, she tears a rent in it; or if both are in doubt about the matter, they leave final decision to the regular examiners in the room below, who by long experience have become wonderfully expert in deciding the fate of printed sheets. The plate is now on the other side of the press. It is again heated, inked in, and polished, as before, and run with another sheet between the rollers back to the starting-point.

These changes of position take considerable time, and add not a little to the noise in the room. Both difficulties are obviated to a large degree by the D press, which is exactly like the other press, except that a part of the upper roller is cut away, making a cross-section look like the letter from which it derives its name. As soon as the impression is affected, the bed of the press, to which is attached a counterpoise, runs back automatically to the other side, leaving the plate untouched by the upper roller. A gas jet under the press heats the plate, so that the printer does not have to remove it. He can ink it in and polish it without changing his position. In the case of the steam-press all these operations are going on simultaneously, and all, save that of polishing, are done by machinery. The four plates that it requires move around a square frame, and while the two assistants are either putting on or taking off a sheet, and while one plate is being printed from, another inked in, and a third wiped, the fourth is being polished by the printer, who does nothing else.

With one of these presses a man can print four times as many impressions as with a hand-press. So largely have they reduced the cost of certain classes of work, like internal revenue stamps and the backs of notes, that they have been introduced into the bureau quite extensively. But the printers, like the women that trimmed and separated notes by hand in the early history of the establishment, have bitterly opposed their introduction. So strenuous have been their efforts during the past year to have them removed that one of the last acts of the Fiftieth Congress was to abolish them, and thus to cripple very seriously the productive capacity of the bureau. The printers claim, of course, that the work done on them is not as good as that done on the hand-press. But the real cause of their opposition is the fear that the steam-presses will drive out the hand-presses, and consequently deprive them of employment; for to the untrained eye, and often to the trained eye even, there is no apparent difference between the backs of notes and the revenue stamps printed on steam-presses and those on hand-presses.

All presses, whether hand or steam, have registers attached to them. Every impression recorded calls for a sheet of printed securities, or a waste sheet, or "tissue," used in adjusting the press. At the close of the day's work a clerk in the division examines each register, notes the count indicated, and compares it with the number of printed sheets and tissues delivered by the printer. These two counts must agree not only with each other, but with the count of the wetting division. If there is no discrepancy, all is well; if there is one, it must be accounted for before a single printer or assistant is permitted to leave the building; for every sheet, whether it is only blank paper or an incompletely printed security, is as valuable, according to the rules of the bureau, as though it had been issued perfect from the Treasury; and if lost, it is assessed to the full amount of the face upon the employés of the division where it disappeared. Sometimes a sheet is mislaid, and a little search brings it to light. Perhaps the printer has neglected to call the attention of the clerk that, through a defect in the press or in the register, an impression has been recorded without the printing of a sheet to correspond, but he is seldom negligent of this duty. The moment that he discovers any trouble of so serious a nature, he summons the clerk and explains the matter. If his explanation does not seem satisfactory, his assistant is called to one side and closely questioned. If she tells a plausible story, and it agrees with his, the explanation is accepted, and both relieved of responsibility. It thus becomes absolutely impossible for a printer to smuggle in a blank sheet of paper, cover it with the impressions of thousand-dollar notes, and take it away with him. Collusion with his assistant would not enable him to do it, and no attempt at such a fraud is on record.

Does a plate ever wear out? One would imagine that a hardened piece of steel treated no worse than the moderate pressure of a press would last a lifetime; it does not, however. After it has yielded fifty or sixty thousand impressions it begins to show signs of wear. The engraving loses its delicacy, and the lines look coarse and heavy. The plate must then be discarded as worthless, or re-entered, as they say, and its usefulness renewed. The operation is effected by the transfer press. The plate is adjusted in the same way that it was when laid down, and with the original roll the work on each subject is made as sharp and distinct as at first. It may thus be restored many times, and its life prolonged, until the steel becomes so thin that it cannot be re-entered again.

If the government has not found it practical to manufacture the paper for its own securities, it has at least found it desirable to make the ink with which they are printed. As the production of this indispensable adjunct of the printer's art is simple and easy, the bureau can undoubtedly better afford to mix and grind it than to buy it. The picturesque process of burning the linseed-oil to eliminate the fat is carried on under a dingy shed in the rear. Heated in large vessels to a certain temperature, the oil is set on fire, and allowed to burn until it is reduced to the proper consistency. The thick oil is called "strong," and is used for bank-note ink, which is the highest grade; the "weak" oil is for revenue and other low grades of ink. It is taken to the low dark rooms in the sub-basement, where it is mixed with dry powder and ground in small iron mills. As the fluid runs out in a ropy stream, it is caught

in hydraulic presses to a pressure of several thousand pounds to the square inch.

These presses, by-the-way, were bought many years ago, and were devoted to a different kind of work. To avoid the expansion and contraction of securities caused by alternate wetting and drying, Mr. Clark hit upon the plan of printing them on dry paper in hydrostatic presses. The pressure required to produce a satisfactory impression was so great, however, that the presses were often broken; and although much fractional currency was printed on them, the plan was finally abandoned, and the presses removed to the examining division, and used to give the finishing touch to printed sheets. As soon as they are removed from the mill-boards they are "shaken up"—that is, the edges made even with one another; they are then deposited in the vault division. The incomplete work goes to other divisions to be finished. Notes and certificates, for example, are returned to the wetting division. The backs having been printed first, the faces, which receive more attention because of the finer engraving on them, are printed last. After passing through the examining division the second time, they are sent to the numbering division in the L on the same floor.

To those unfamiliar with the methods of protecting securities against counterfeiters, the numbers printed in red or blue ink on the panels of the face of notes or certificates have little or no significance. Especially whimsical and unintelligible appear the letters with which the numbers begin and the odd characters with which they end. But if they add nothing to the beauty of the design, and seldom, if ever, attract attention, they do not deserve the obscurity and neglect with which they are favored, for they are indeed important features of the securities to which they are attached, and many a counterfeiter by his ignorance of numbering has omitted an indispensable safeguard against detection. All counterfeiters know, probably, that the letter indicates the series to which the note belongs, and that the odd character, varying with different series, is used, like the lines drawn in the blank spaces of a check, to prevent the addition of anything else. Some of them may know, perhaps, that only certain letters—A, B, D, E, H, K, U, V, and X—are ever printed on money, and that the employment of any other letter—like C, O, or I, for instance, or the letters R, P, and T, which appear on internal revenue work exclusively—would disclose at once the true character of their work. What many of them are entirely ignorant of is the difference between the numbering of a United States note and a national bank-note, and the relationship existing between the number and the check letter on United States notes and silver certificates. The numbers on the four subjects of a national bank-note are the same. But in the case of United States notes and silver certificates the subjects are numbered consecutively from one up to any desired number—that is, the first subject at the top of a sheet is numbered one; the second, two; the third, three; the fourth, four. The first subject of the second sheet is numbered five; of the third sheet, nine; of the fourth sheet, thirteen; etc. Or, to set forth the matter more clearly, I will append the following table:

Check letters	A	B	C	D
First sheet	1	2	3	4
Second "	5	6	7	8
Third "	9	10	11	12
Fourth "	13	14	15	16
Fifth "	17	18	19	20
Sixth "	21	22	23	24

An inspection of this table will show that the number of the first subject on every sheet after the initial sheet is divisible by four, with one remainder; the number of the second subject is divisible by four, with two remainder; the number of the third subject is divisible by four, with three remainder; the number of the fourth subject, being exactly divisible by four, leaves no remainder. The counterfeiter, overlooking this fixed relationship, engraves one plate with a check letter, and numbers his notes from one or any other initial number up to the number that he prints. Three out of every four of his notes will thus bear impossible numbers. If he selects B as his check letter, and begins with number one, only the second, sixth, tenth, fourteenth, eighteenth, twenty-second note, and so on, will have possible numbers, and these notes might, of course, escape detection if this test of relationship alone were applied. But other features of the notes, like the engraving of the portrait and vignette, or the geometrical lathe-work, would reveal their spuriousness.

Next to the engraving division, the numbering division is the pleasantest in the bureau. It is well lighted, its ceilings are white and clean, and the smutch and litter inseparable from the printing and examining divisions are entirely absent. It is a noisy place, however, for the numbering machines make a loud and perpetual clatter. At each one of them is seated a neatly dressed operative feeding sheets under an ingenious device of circular disks, on which the numbers from one to nought are cut in relief. The work appears simple and easy, but not every girl has the "straight eye" necessary to hold a sheet so that the number will be printed on the centre of a panel; nor is every girl capable of the close attention that the work requires. Without these qualifications she is certain to spoil a large amount of work. To provide for average human fallibility, ten sheets to the thousand are allowed for mistakes; and while some girls use the full allowance, others use only two or three. Whenever a sheet is spoiled it is cancelled; that is, it is punched full of holes on a machine for the purpose, and the numbers reprinted on a new sheet.

Notes and certificates are not the only kinds of work that go to the numbering division. Bonds, checks, and certain classes of revenue stamps are also numbered. As soon as received, they are counted, as in every other division; and after they have been passed through the machines, they are examined to see that the numbers preserve their sequence and are properly printed; at the same time they are again counted to make sure that no sheet has been lost. Those not requiring any further work are trimmed, put up in packages, and sent to the vault division. Occasionally one containing forty thousand dollars, more or less, is left in view to excite the wonder and cupidity of the beholder. Upon the receipt of the packages in the Treasury, they are opened, and from a steel plate, on an ordinary press, the red seal is printed on the face of each note. The sheets of United States notes and silver certificates are separated by machinery, and made ready for circulation. The national bank-notes are shipped in sheets to the banks ordering them; and there, signed by the president and cashier, they are separated and paid out according to the demands of business.

I have omitted to say that before the national bank-notes are sent from the bureau, they pass through the surface division in the basement. Here they receive upon their face and back, or upon both, the charter number of the bank to which they belong. Girls do this work on ordinary one-cylinder presses, such as may be found in any first-class job office. Each press has a register, in which is recorded every revolution of the cylinder, and, as in the printing division, the number of printed sheets and tissues must, at the close of the day's work, correspond with the record.

One kind of printing done in the surface division deserves special mention. I refer to the tint, or lace-work of fine lines, printed on securities in an ink of a different color. Many years ago a large bond robbery occurred in New York. Some of the stolen bonds, when returned to the Treasury, were discovered to have been skilfully changed by the use of acid. It was suggested to Secretary McCulloch that if the part of the bond subject to alteration were protected with a tint printed in fugitive ink, no chemicals could be applied without destroying it. He approved of the suggestion, and since then the tint has been a feature of several classes of work. At one time pension checks were without this safeguard; but when one of them was returned to the Treasury with the figures changed, and the lines in the panel, which had been removed to make the alteration, restored with a skill that almost defied detection, it was decided to protect them with a

THE QUESTION OF A QUORUM.

THE Speaker of the House of Representatives is elected by a party majority, but, as Speaker CARLISLE showed by a service of four years, he may be so just and fair as a presiding officer that even his party opponents will gladly acknowledge his impartiality. His successor, Speaker REED, who is also the real leader of his party in the House, has already lost the opportunity of similar distinction. When the House met, there was a small Republican majority, and there were several contests for seats to be determined, and there were no rules of procedure. In this situation the patriotic and honorable, as well as the usual and traditional, course was evident. It was to make the adoption of rules the first question in order, that the settlement of contests, which were sure to produce excited debate, might not give occasion to the exercise of doubtful powers by the Speaker, which could only change excitement into exasperation. By taking this course, there would have been a code adopted by the majority to which obedience would have been a plain duty. If the minority had filibustered to prevent the adoption of rules, it would have put itself plainly in the wrong, unless it could have shown that the rules were intentionally unjust to the minority.

The attempt to settle contests and to do business without rules, and under the discretion of a relentlessly partisan Speaker, has resulted in an appeal to old passions against the minority, which is wholly unworthy of the majority. The assertion of Mr. MCKINLEY and Mr. BUTTERWORTH that the trouble was due to the unwillingness to yield to the majority was a plausible platform trick, but it was not sustained by a single fact. The very point at issue was

test of popular government is the power of the people to restrain themselves. Unless that power exists such government is impossible, and the history of the Supreme Court is the long and illustrious demonstration of the existence of that power in the American people.

This conclusion is not disproved by the civil war. It is not supposable that any form of government, under all circumstances and all conditions of exasperated passion, can maintain peace. It is enough that all the serious doubts and Constitutional controversies of a century, except one, have been happily healed under the benign influence of the Court, and that only a dispute of the fundamental character of the government—a dispute which was purposely not definitely determined in the Constitution—was brought, as was inevitable, to the decision of arms. But the serene wisdom of the Court—and this is one of its greatest claims to national respect and confidence—under the adjusting amendments in which the war resulted, in no manner or degree permitted the cardinal conditions of the government to be affected. The national power is defined, and local authority is left absolutely untouched, however specious the plea for its disturbance. There has been question of the wisdom of some of its decisions, but, upon the whole, the Court was never more strongly intrenched in the trust and affection of the people. Its dignity and moral power reside in the fact that it is not only the creation but the reflection of the people.

The celebration was simple and impressive. It was saddened by the thought of the terrible calamity which prevented the presence of the President and the cabinet, but the discourses of the day were admirably appropriate and valuable reviews of the history of the Court, of the exercise of its great functions, of reminiscences of its members, and of its relations to the people. That the prolonged series of grave essays was somewhat wearisome is undeniable, but was not unanticipated. Considering the impossibility of saying everything upon so great a theme within the hour or hour and a half which a single discourse may fairly occupy, it is questionable whether the wiser course upon such occasions is not the selection of one orator only for such treatment, as

them the leader of the House, dared to defy these awful epithets. They voted with the Democrats against the amended bill. The Republican Senate voted for it. There were dire confusion, and high words, and a conference committee, and a report, and a rejection of the report by the Assembly, and a mysterious and bewildering remark that the whole row was a scramble for Mr. EVARTS's old shoes. The week ended with a breach in the party of the majority, and another remark of great energy from a legislator that he wanted the Fair, but he didn't want, and he'd be —— if he'd have, any TOM PLATT in it, the gentleman referred to being understood to be the private Mr. PLATT who withdrew fatigued from the Senate of the United States after a service of two months. The consequences of this violent party difference may be very serious for the chance of obtaining the Fair for New York. We are assured in all the papers that there is an enthusiastic and unanimous demand for it. But does this show it? Does the bill itself, which draws the money from the city, show it? Have not politics already superseded any other active interest in the Fair? Is the petulant denunciation of everybody who asks any question about what are obviously very questionable proceedings a proof of universal interest and determination? Really the vital question of the Fair seems to be, does Mr. PLATT wish it? The only answer seems to be, that his chief wish is that if there be a Fair, there shall be no politics in it, and the performance at Albany is the process of taking politics out of it.

"A GREAT DAY FOR COLUMBIA."

THE installation of the new President of Columbia College in the city of New York was an event of very great interest and significance. A man of scholarly accomplishment and training, of great experience in public and commercial affairs, of a singularly sound and wise judgment, of tried administrative skill, and of tranquil independence and courage, blended with admirable moderation, is called, in the full vigor of his manhood and before middle age, to the conduct of a college which had a close and intimate relation to the local and national life of the last its earlier day, the probability of a generous and effective local public sympathy would soon be apparent.

In the evening, at the brilliant dinner of the Alumni, President Low made some very interesting and detailed statements in regard to the pecuniary condition and prospects of the college, and added the emphatic remark that while its resources seemed large, the expenses of such an institution, if adequately maintained and reasonably enlarged, would be very much greater than any income now possible. President Eliot, of Harvard, in a frank and friendly speech, which fitly ended the proceedings of a memorable college day with the counsel and benediction of our oldest college, mentioned some facts in regard to Harvard similar to those respecting Columbia mentioned by President Low. Upon this subject the moral of the Harvard President's speech was that Columbia required a more liberal support from New York than it had received, and that with such support it would become an institution in extent and variety, no less than in quality, worthy of the chief city of the country. His concluding remarks upon the true range and scope of such an institution were in a lofty strain, which was as delightful as it was natural, because it was the true voice of Harvard. It was the close of a day of renewed hope and faith and energy, which had recalled Jay and Hamilton, Livingston and Morris, Clinton and Verplanck, to illustrate the early leadership of Columbia, and to stimulate the just pride of a great city in its oldest school. The chief colleges which were not too distant had come to congratulate their comrade. A host of proud Alumni were gathered to cheer the happy event. "It is a great day for Columbia," said Mr. Coudert, the President of the Alumni, as with quaint humor and felicitous eloquence he presided at the dinner; "but it is a greater day for New York."

A QUESTION AND AN ANSWER.

The Charleston *News and Courier* replies with perfect courtesy to our late question. The *News and Courier* having said that in all the Southern States a reasonable and intelligent ballot would be counted whether cast by a white or colored voter, we asked who shall decide what is a fair and reasonable ballot? The *News and Courier* answers, "The white race of the South is going to decide for itself, unaided and unhindered by any others." But as the postulate of this answer, as given in the same article, is that "negro rule cannot and will not be borne," the answer means that if the majority of ballots at any election should be those of colored voters, they would for that reason be rejected by the white voters as not fair and reasonable. The answer, therefore, as the *News and Courier* will see, does not vindicate its original remark, which was that ballots, even if from colored voters or presumably for colored candidates, would be counted if fair and reasonable. The conclusion now is, plainly, that fair and reasonable ballots would not be counted if they resulted in what is called negro rule; and this, unquestionably, is the position of the white voters in the Southern States.

It is at least a frank and intelligible position. The resources of the national government are exhausted. The question has become one for the people of every State to decide for themselves. The Supreme Court has interpreted the Fourteenth and Fifteenth amendments in accordance with this view. But there are yet two points which so intelligent a journal as the *News and Courier* cannot neglect. The first is that its declaration, "negro rule," however intelligent, "cannot and will not be borne," is in direct contravention of the purpose and spirit of the declaration of the Constitution that the right to vote shall not be abridged by any State on account of color. Technically and literally it is not abridged by the State, but it is abridged in fact, and confessedly on account of color, by citizens of the State. The *News and Courier* will not deny that in such abridgment the moral purpose of the amendment is defied. Does the *News and Courier* think that a community can wisely and safely live in constant, confessed, and intentional contempt of the provision of its fundamental law upon the most vital power of a popular government—the suffrage? This is not a question of color, because it is equally applicable to any similarly disfranchised class.

The other point is of another kind. The Fourteenth Amendment provides that if the right to vote is denied to any lawful voter because of any reason except for crime, the basis of representation shall be proportionately reduced. This again contemplates State action. But there is no moral or honorable doubt of its purpose. When, therefore, the right to vote of half the voters in a State is denied by the other half, although there may be no national remedy, does the *News and Courier* think it fair or safe for that other half to enjoy the share of representation which is based upon the suppressed vote? Granting that the negro is incapable of intelligent voting, and that the whites are justified in annulling his vote, are they also justified in securing by that course a representation which in some cases is double that of their fellow-citizens in New York and elsewhere? These are questions, as we think the *News and Courier* will agree, not of mere sentiment, but of national harmony. They are asked in no spirit of dispute, but for information. They must have occurred to honorable and patriotic citizens of the Southern States. To the direct inquiry of the *News and Courier* what we should do in the same situation, we answer that before abandoning the fundamental principle of popular government and the purpose and provisions of the Constitution, we should certainly attempt a legal restriction of the suffrage, and we should insist that the State should relinquish the representation which she enjoys solely because of the assumption that the vote is actually cast which is in fact suppressed.

MR. PLATT'S ASCENDENCY.

A correspondent asks us the explanation of the singular ascendency of Mr. Thomas C. Platt in the Republican party of New York. It is not a surprising question. Mr. Platt holds no public office. He is not known as a statesman. He is not an orator nor a "magnetic man." He is not identified with important public actions. He is not even a public figure, in the sense of general familiarity with his appearance. But there is no Republican in the State, no Senator, no Representative, no leader of any mark, who has so plain and positive an influence in directing the party. If an appointment be sought, it is well for the applicant to have the influence of any one of certain gentlemen. But if a rival can gain Mr. Platt's favor, it will outweigh them all. It was naturally supposed after Mr. Warner Miller's campaign for the Governorship of New York, and the picturesque telegram of condolence with his defeat from President Harrison, that Mr. Miller would be a very influential friend of the administration, if not its chief adviser in New York. But this has not happened. Mr. Platt seems to have been the recognized power in the State.

The reason of his ascendency we suppose to be his mastery of the modern methods of party management and his political sagacity. Mr. Platt makes a business of politics. He sees the relation of events as they occur to parties and politicians, and he perceives how to turn them to party results. If a Convention is to be held, he has already and betimes decided, from his point of view, who would be a suitable candidate, and by long attention and care, like Mr. Thurlow Weed and Mr. Tilden, he has established such relations with local politicians throughout the State that when the Convention meets the advice of Mr. Platt is readily followed, because experience seems to the party politicians to have demonstrated its value. In such ways, and with the advantages of the prestige which attends such leaders, and which exaggerates both their ability and their power, he becomes practically a party autocrat. Cool, self-possessed, reticent, and ready at every point and for every emergency, he easily frustrates less well laid plans and sudden "spurts" of independence and opposition. The habit of submission leads his party, as in the case of Tweed, to do his behests, as in the action upon the World's Fair bill. It is a kind of power which a man of a certain taste and sagacity, willing to devote himself to its acquisition, may be pretty sure of obtaining.

Such ascendency is all the more attainable at a time when no great and absorbing question commands public attention, and when party union is maintained less by conviction and feeling than by tradition and discipline. In times when party politics become a game, the necessity of what is called a machine to secure party success is more evident, and it is at such times that the qualities which are recognized in Mr. Platt are found most useful. His position in his party, whether agreeable or not to party pride, is undoubtedly that of leadership, and it is not improbable that he is looking to a return to the Senate of the United States.

THE CALAMITY AT WASHINGTON.

Since the assassination of President Garfield no event of the kind has so deeply shocked the country as the calamity which has befallen Secretary Tracy. It may be almost said to have brought a pang to every household in the land, and sympathy for the Secretary has been universal and profound. This melancholy event and the double bereavement of Secretary Blaine have cast a mournful shadow upon the administration, and they call a truce to the fury of party warfare. But no sympathy, however sincere and general, no pity, however tender, can assuage the grief of the chief sufferer. It can be hoped only that time may gradually soothe the sorrow which it can never heal, and that devotion to great duties may at last reconcile him to a life from which all joy has vanished.

MR. PARNELL AND THE "TIMES."

The settlement of Mr. Parnell's suit for libel against the London *Times* by the payment by the *Times* of twenty-five thousand dollars, and the practical confession of its offence, is an exceedingly significant event. Mr. Parnell had denied in the House of Commons the truth of the charges of the *Times*, and had asked for a committee of investigation, which was refused. The subsequent proceedings before the commission revealed the forgery of the papers upon which the charges were founded, and the complete deception of the *Times*. It was a great humiliation for the Thunderer. But it was more, because it showed to the British public its mistaken estimate of Mr. Parnell.

The articles, which were designed to demonstrate the identity of Parnellism and crime, were adapted to the existing British opinion of Mr. Parnell. That he was substantially a conspirator against the unity of the empire, who would not hesitate, and had not hesitated, at crime to effect his purpose, was the belief of a great and powerful body of Englishmen, represented by the coalition of Tories and old Liberals known as the Union party. The confession and death of the forger was both a moral defeat and demoralization of this party, because it shook profoundly confidence in the wisdom of the party leaders and in the criminality of Mr. Parnell.

That the Union party view of the political situation is not extending is shown by the elections, and the strong influence upon public opinion has been undoubtedly the revelation of the forgery. This is now followed by the confession and payment of damages by the *Times*. It is the completion of the greatest disaster that has ever befallen that paper. For its willingness to pursue an opponent in the most ruthless manner upon evidence which ought not to have deceived a child has been exposed, and reliance upon its judgment and its mysterious sources of information has disappeared. It is now to be seen whether the House of Commons will bring to its bar the authors of a baseless criminal libel against one of its members, or whether such a triumph for Mr. Parnell would be too intolerable.

PERSONAL.

The late Professor C. A. Lyman, of Yale College, had during his life of seventy-six years been the pastor of a church in this country, a missionary in the Sandwich Islands, a land surveyor, a California gold miner, an editor, a teacher, and an astronomer. He was graduated from Yale in 1837, among his classmates being Senator W. M. Evarts, Chief-Justice Waite, Judge Edwards Pierrepont, and Professor Benjamin Silliman. He helped start the *Yale Literary Magazine*, and years afterward worked on the first unabridged edition of Webster's Dictionary. In 1857 he became Professor of Industrial Mechanics and Physics in the Sheffield Scientific School, and in 1870 was appointed Sheffield Professor of Astronomy and Physics.

—M. F. H. De Haas, the well-known marine painter, who has his workshop in the old Tenth Street Studio Building, resides in Brooklyn, E. D. Twice a day he crosses the East River by the Twenty-third Street Ferry, and even in the worst weather seldom fails to keep his stand outside, that he may have the opportunity of studying water and sky effects. He affirms that he has caught some of the best points he has made in painting during these trips. Mr. De Haas is a Hollander, and although he has lived in this country for many years, has never lost a certain preciseness of pronunciation that betrays his foreign birth and education.

—Among his many cares of state, Prince Bismarck yet finds time to divert his mind with other pursuits. He has just established a large brick-yard near Lauenburg, where there is a fine bed of clay, and he has for some time carried on the businesses of a paper-maker, a distiller, and a farmer.

—Another picture of Mr. Gladstone is about to be begun by the artist Bionell, but instead of giving regular sittings, the Grand Old Man requires that the painter shall set up his easel in the statesman's library, and catch such expressions as he wishes while his subject is busy with his own work. A very successful portrait is expected from these methods, and when completed it will be taken to the city of Birmingham.

—Preston Ware, of Boston, a famous chess-player, is dead, at the age of sixty-nine years. He had played in chess congresses in this and other countries, and had met nearly every famous player of his time.

—Senators Berry, of Arkansas, and Hampton and Butler, of South Carolina, have each lost a leg, while in the House, Colonel Oates, of Alabama, and General Hooker, of Mississippi, are both one-armed.

—John Rogers, the sculptor, began life as a Boston dry-goods clerk, and not till he was thirty-one years old, after he had run a locomotive on a New England railroad, worked in a machine shop, and been a surveyor, did he produce his first group, the "Slave Auction." During these years of waiting he had worked in clay in a small way, and even saved enough money for a trip to Paris and Rome. He is now sixty years old, and during the last half of his life has made and sold eighty thousand groups, "Coming to the Parson" having the largest sale.

—Miss Amy C. Fowler, or Sister Rose Gertrude, the young English nun who is going to the Sandwich Islands to devote her life to the lepers, is the daughter of Rev. Francis William Fowler, an Episcopal clergyman at Combe Down, near Bath, England. She has spent much of her time in London hospitals, and studied leprosy for two years in Pasteur's Institute in Paris. Besides her work among the disease-stricken islanders, Miss Fowler will study and cultivate leper bacilli, a complete set of instruments for this purpose being a part of her equipment. The result of her labors will be sent to the leprosy society of Boston. Miss Fowler is petite in form, weighing hardly one hundred pounds, and has a pretty and intellectual face.

—The late William Warren, of Boston, provided by will that after his wife's death $50,000 of his property shall be given to the Boston Museum of Fine Arts, to purchase paintings by artists of the modern school.

—For the first time since her husband's death, Mrs. General U. S. Grant is spending a part of the winter in Washington, and sharing in the social gayeties of the season. She is the guest of Mr. and Mrs. Washington McLean.

—"Aunt Dolly" Curtis died recently in Warwick, New York, at the age of one hundred and seven years. She contracted a second marriage in her ninety-second year, the bridegroom being sixty-eight years old.

—Lyman Trumbull, so much of whose life has been spent in public service, still practises law in Chicago. He is seventy-seven years old, but in good health.

—Some of the rarest chrysanthemums produced in this country had their origin from specimens sent from Japan by Rev. Joseph Neesima, the missionary who has just died in his native land. He came to America as a stowaway in 1864, was educated at Amherst and Andover, and then returned to Japan, where he labored effectively for the cause of Christianity.

—Thomas A. Jones, who was recently discharged from some inferior position in the Washington Navy-yard because he helped John Wilkes Booth escape across the Potomac after assassinating Lincoln, is about seventy years old, and at the outbreak of the war was a prosperous planter, near Pope's Creek, Maryland. He was a rebel sympathizer during the war, and when a friend came to him with the fleeing Booth, he helped secrete the assassin for a week in the woods, and then sold him a boat with which to cross the river.

—A curious character in southwestern Maine is George S. McIntire, whose appetite for mathematics and poetry has given him a more than local reputation. He is over sixty years old, and has always led a hand-to-mouth existence, his remarkable proficiency in the branches mentioned never having proved of any particular value to him. His taste for figures was roused when he was a boy by the gift of an old algebra. He mastered this without assistance, and since then has never been able to satisfy his greed for mathematics, the most abstruse branches proving no obstacle to his strange mental acquirement. His fondness for poetry is also marked, and he recites at random from Shakespeare, Milton, Byron, and Whittier. At present McIntire lives in a Biddeford garret, subsisting on the scraps which charitable acquaintances give him.

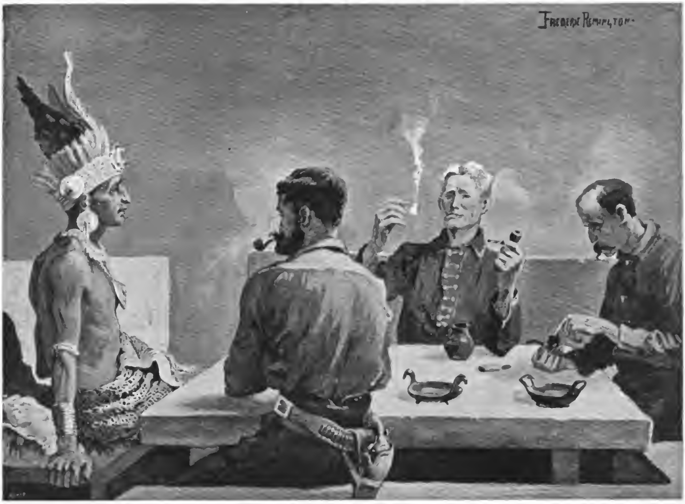
SECRETARY TRACY'S TERRIBLE BEREAVEMENT.—[See Page 127.]



"AS WE FILLED OUR PIPES HE WATCHED US CURIOUSLY."

THE AZTEC TREASURE-HOUSE.*

BY THOMAS A. JANVIER.

XVII.—OF OUR COMING INTO THE VALLEY OF AZTLAN.

SO unexpectedly had we come upon these strangers, and so marvellous was the finding thus of the hidden tribe for which we had sought so long, that I could not but dread, as we advanced toward the Aztec warriors, lest I should wake suddenly and find that it all was a dream. And they also, as it seemed to me, looked upon us doubtingly, and with somewhat of awe in their regard, as though uncertain whether we were beings from another world or men of flesh and blood like themselves.

Not until we were close upon them did further words—after that first challenge and answer—pass between us; and then the elder of the two, still making the peace sign with his raised right hand, and speaking with a trembling in his voice, as though deep emotion moved him, called to us: "Have our brothers need of our strength? Bring ye the token that summons us to their aid?"

I should have been glad just then for opportunity to consult with my companions as to what answer I should make to these questions; for I perceived that our position was a very critical one, and that even our lives might depend upon the wisdom of my reply. For a moment I waited, in the hope that Fray Antonio would make answer, but as he remained silent there was nothing for it but that I should take the hazard upon myself. Therefore, bringing forth the ancient piece of gold from the snake-skin bag—for so I had carried it constantly, even as the Cacique had done before me, and others before him for more than three hundred years—I held it toward the man who had spoken, and said firmly: "Here is the token of summons left behind him by Chaltzantzin; but we came not to call you forth to battle, but to bring tidings that the fate which that wise king and prophet foresaw for his people long since was fulfilled. In the time appointed, the stranger foemen overcame and enslaved your brethren, bringing to pass that which Chaltzantzin foretold; and the message that then was sent to call you forth to their aid reached you not, because even the wisdom of Chaltzantzin was powerless against the will of the gods. Yet the gods desired not to destroy your brethren but to punish them; and their punishment now is at an end. Once more are they free, and once more is their ruler a wise and a valiant man of their own race. Therefore the news which we bring you is not sorrowful but glad."

While I was thus speaking, the ringing cries which at the first alarm had sounded over all the valley grew louder and stronger; but as yet we saw only the two men who at the first had confronted us—for we were in a deep recess in the mountain whence the ground dropped away in front; so that the immediate foreground was hid from us and we saw only some distant meadows, and then a broad lake, and over this more meadows and a sweep of heavy timber, and back of all great mountains rising against the clear blue sky.

But as my speech ended, and before those to whom it was addressed at all had digested the wonder of it, and so hesitated in their reply, a half-dozen men and a woman or two came in sight in the narrow way before us, panting after their rapid ascent of the acclivity; and the calls of others pressing up the slope behind them sounded loudly, and in a very little while a crowd of a hundred or more pressed about us; all gazing at us and questioning us with a most eager surprise. For the most part these seemed to be laborers from the near-by fields; for many of them carried agricultural implements, and their bare legs and arms were splashed with mud and were grimy of the soil. As for the look of them, save that the flowing garments of cotton cloth which the women wore were embroidered in a fanciful fashion, I could not have distinguished these people from the tallest and strongest of the Indians dwelling in the hot lands of the coast about Vera Cruz. The men, who wore only a cloth twisted about their loins, were as magnificent fellows as I ever saw. Every one of them was tall and straight, with broad shoulders and narrow hips, and the muscles of their arms and legs stood out like cords. From Pablo, who was an unusually tall and well formed lad, they differed only in the color of their skins—which were decidedly darker than his, as was to be expected in the case of men dwelling in this tropical region at the level of the sea.

Toward Pablo these people manifested a familiar curiosity quite unlike their reverential manner toward the rest of us, who so obviously were not of their own race. And Pablo was as much perplexed by their questions as they were by his answers; for never was a conversation carried on so hopelessly at cross-purposes. The boy, being spoken to by folk who obviously were as entirely Mexicans as he was himself, and in a tongue that practically was that which he had been born to—for the Indians dwelling in the Guadalajara suburb of Mexicalcingo, being the direct descendants of a pure Aztec stock, speak the Nahua language very correctly—could not at all realize that he was at last among the ancient race for which we had searched so long. It was his belief that we had come out, in accordance with Rayburn's forecast, into the coast country, and that the people around him were the ordinary dwellers in the hot lands. And the Aztecs, knowing him to be one of themselves, no doubt believed that he knew of the purpose for which they had been left to dwell apart, and so plied him with questions concerning their brethren from whom through long ages they had been separated.

As their talk went on, getting the more involved with every question and reply, a tendency toward ill-temper began to develop itself on each side; for Pablo considered that these people, who professed to be ignorant of so important a city as Guadalajara, were making game of him; and they were not less disposed to believe that he either was answering them falsely or that he was a fool. Fortunately, before any harm came of these misunderstandings, an interruption brought a temporary end to their talk.

There was a stir among the crowd, and then an opening was made in it through which came an elderly man, wearing military trappings similar to, but much handsomer than, those worn by the two warriors whom we had first encountered; and it was evident from the air of deference with which these saluted him that he was their superior officer. In spite of the dignity of his demeanor it was evident that he was greatly excited by our advent, and his voice quivered and broke a little as he asked us who we were and whence we came. As I repeated what I had already told the guard, and showed the gold token, the expression upon his face was that of extreme perplexity. That the gold token gave us a strong claim upon his respect, almost upon his reverence, was evident by his manner as I showed it to him; but the conditions under which it was presented obviously rendered him very uncertain as to what action was proper for him to take.

When I had finished my statement, and had returned the token to its place in the snake-skin bag (for the wisdom of carefully retaining this potent talisman in our possession was evident), the officer turned to the two warriors, and they conversed for a while in low tones apart from us. Of their talk I could catch only a few words; but several times I heard repeated the name Itzacoatl, and frequent reference was made to the Twenty Lords. I gathered, too, that the name of the officer was Tizoc, and that the name of the elder of the two warriors, a swarthy man, was Ixtlilton. In the mean time, out of respect to the officer, the crowd had drawn away from us—being now swelled to very considerable numbers—but those composing it gazed at us in wonder; and among them was a steady murmur of low talk like the buzzing of a hive of bees.

When his conference with the warriors was ended, Tizoc approached us, and with him came a younger man who carried a roll of paper in his hand. The face of the officer still wore a troubled, doubting expression, and these feelings were expressed also in the tones of his voice as he spoke to us. "For the coming of the token from our lord Chaltzantzin we who dwell in this Valley of Aztlan have waited through many ages," he said; "but the promise was given that the token should come to us from our brethren in the time of their need, and should be brought by those of our own race. But you tell us that the time of need long since is past, and ye who bring the token are of a race that is strange to us—and even this one among you who seems to be of our brethren speaks strangely of strange things. Had ye come in the way that long past was promised, there would have been no room for questioning your right of entry here nor your authority over us; and I, who am the Warden of the Pass—being in right succession from him whom our lord Chaltzantzin appointed to this high office—would have been the first to do you reverence and honor. But in this strange case that has arisen I hold it to be my duty to send news of your coming to the Priest Captain, Itzacoatl, that he and his Council of the Twenty Lords may decide what now is right to do. In this I mean no disrespect and no unkindness; and while be transmitted as a part of the report that Tizoc was about to make to the King concerning us, and that he must find no fault with them.

---

* Begun in HARPER'S WEEKLY No. 1722.

"He's goin' to send that thing to the King an' say it's me, is he? No, he's not—not by a jugful! See here, Professor, here's a photograph that I had taken last spring in Boston; I meant to give it to a girl before I came away, but she went back on me an' I didn't. It's not much of a photograph, but it don't look like a squash trimmed with red clover. If they want to send anything, let 'em send that." And before I could stop him, Young had taken the photograph out of his pocket-book and had handed it to the secretary with the remark: "Just say to him, Professor, that he is to give that to the King; and tell him to tell the King that Mr. Seth Young, of Boston, sends it with his compliments."

After all, no harm came of this absurd performance, but rather good. For the secretary exhibited the photograph to Tizoc, and both of them, and the two warriors also, were lost in wonder at its marvellous likeness to the original; and evidently held us in increasingly great respect because we were the possessors of such an extraordinary work of art. Young was a good deal chagrined, however, because the picture of him that the secretary had drawn was forwarded as a part of Tizoc's despatches. He said that since he had set up a good likeness of himself it wasn't the square thing to send the King a bad one.

When the secretary, bearing the despatches, had departed, Tizoc requested us to accompany him to the near-by guard-house, where we could refresh ourselves by bathing, and where food and drink would be provided for us. This order, for such it was, we obeyed gladly; for we were both weary and hungry, and the prospect of what Young described as a good wash and a square meal after it was very pleasing to us. A detachment of men from the guard-house, accoutred in the same handsome fashion as Ixtlilton and his companion, had arrived while the secretary's portrait work was in progress; and I observed that all of these guardsmen (excepting only Ixtlilton, whose skin was dark) were much lighter in color and more gracious in bearing than the men in the crowd around us. So marked, indeed, was this difference that they seemed scarcely to belong to the same race.

As we moved away through the opening that the crowd made for us, with a platoon of guardsmen in advance and another in our rear, Pablo touched my arm and was about to speak to me; but before his mouth could open there sounded

the land rose in broad terraces, broken by clumps of timber and by many groups of smaller trees which, because of the regularity of their growth, I took to be fruit plantations. All the open country seemed to be one vast garden, most carefully tended, and everywhere cut up by little canals whence water for irrigation was drawn. Scattered everywhere about the valley were single houses embowered in trees, and from where we stood we could see also four or five little towns which also were plentifully shaded. And on the lake many boats were passing, of which several were of a considerable size, and were fitted with curiously shaped sails. And all this exquisite tropical beauty of ample water and luxuriant foliage shone richly beneath the bright splendor of a deep blue tropical sky.

Yet that which most strongly attracted our attention was not this charming display of the manifold excellencies of God's handiwork, but rather a wonderful manifestation of the handiwork of man. Over against us, on the far side of the lake, slantingwise from where we stood, rose a mass of buildings of such vastness and such majestic design that at the first glance we took it to be one of the square-topped mountains which are found not uncommonly in this portion of the world, and around the bases of which are sloping heaps of the fragments of rock which have broken away through countless ages from their weather-worn sides. Yet in a moment we perceived that what we saw was a walled city built upon a great promontory that jutted out from the mountain-side; and in the same breath Fray Antonio and I called out together: "It is the city of Culhuacan!"

As we uttered this name Tizoc turned toward us quickly, and with a startled, troubled look upon his face. "They are not of our race," he said, as though speaking his thoughts aloud, "yet the sacred name, that among us only a few know, is known to them!"—and the troubled look upon his face deepened as we went onward.

The way by which we descended was a narrow road carried zigzag down the cliff—for the pass by which we had entered the valley was fully a hundred feet above the level of the lake—and at short intervals along its course the road was defended by walls of very solid masonry, pierced with openings so narrow that only one man at a time could pass through them. That the walls were for defence was shown by the piles of metal bars on the inner side of each opening—the side toward the mountain—so arranged that in a moment they could be slipped into sockets in the stone-work, thus closing effectually the way.

Perceiving that we regarded with surprise this curious system of fortification, Tizoc explained:

or so square and with a slanting bottom, so that the depth of it ranged from two feet to nearly five, in which was fresh running water; and over the portion of the room that the tank occupied there was no roof but the bright blue sky. On the stone floor were beautifully woven mats, and towels of cotton cloth hung upon pegs driven into the walls, and in earthen bowls were fresh pieces of a saponaceous root that I have seen the like of in use among the Indians of New Mexico. It seemed to strike Tizoc as odd that we preferred to make use of the bath successively rather than all together; but he was too polite a man to interpose any objections to our eccentricities. Pablo only—coming last of all of us—had a companion in his bathing, in the person of El Sabio; and the sleekness of that excellent animal when Pablo had brushed carefully his long coat when his bath was ended was a wonder to behold.

Being thus refreshed, we heartily welcomed the excellent meal that was served to us in the cool shade of the veranda by which the court-yard was surrounded. Our eating was somewhat in the Roman fashion; for the table was a broad slab of stone, raised but a little from the ground, and around it we reclined upon mats with cushions woven of rushes to lean upon. The food was excellent—a small animal of the deer species, but no larger than a hare, roasted whole; birds, very like quails, delicately broiled; little cakes made of maize, which were rather like the hoe-cakes of our Southern negroes than *tortillas*; some sort of sweet marmalade; and a great abundance of oranges, mangoes, bananas, and other fruits common to the hot lands of Mexico—all of which fruits were much more delicate in flavor than Mexican fruits usually are, the result, as we found later, of the great care bestowed upon their culture. Only water was served with the meal, but at the end of it a small jar of some sort of potent liquor was brought, very cool and with an excellent spicy taste, that Tizoc warned us must be taken but sparingly; and, truly, he was right, as I found from the warm and mellow feeling of tremendous friendliness that but half a cup of it infused into me. Tizoc himself did not follow very rigidly the advice that he had given us, and to this fact probably was due the exceeding frankness with which he subsequently spoke with us concerning grave matters of which he surely would have been reticent had he been in a less genial mood.

"Just ask the Colonel if he minds my smoking a pipe, won't you, Professor?" Young said when our meal was ended; and as I myself wanted to smoke, and as I was sure that Rayburn did also,

toward us—since we also could perform a miracle that he obviously made use of as a means of manifesting his divine right to rule—must be that of strong hostility.

To Rayburn and Young, who had observed wonderingly Tizoc's extraordinary conduct, I rapidly translated what he had said, and explained how serious our situation appeared in the light of this new development.

"Well, it certainly is cold weather for this Priest Captain fellow," Young commented, "if we've got hold of his best miracle; and I guess you're about right, Professor—he'll want to take it out of our hides. Just poke up the Colonel to telling all he knows about this old dodger. The Colonel's got his tongue pretty well greased just now with his own prime old Bourbon—pass me that jar, Rayburn, I don't mind if I have another whack at it myself—and we may get something out of him that will be useful. Try it on, Professor, anyway. Here's luck, gentlemen."

That Young's tongue also was a little greased, as he put it, by this very agreeable beverage was quite evident; but his wits were sharpened rather than dulled by the drink, and his present suggestion evidently was a very good one. As for Tizoc, his disposition toward us obviously was most soft and friendly; and as his mind slowly absorbed the fact that somehow or another, the Priest Captain had made a fool of him with a miracle that was not really a miracle at all, his choler rose in a manner most favorable to our purposes. Yet this very feeling of resentful anger—showing a growing irreverence of one to whom all the traditions of his people gave reverence second only to that due to the gods themselves—was startling evidence of the menace that our presence was to the theocratic ruler's temporal and spiritual power. Therefore it was with a keen curiosity that we listened—and Tizoc needed, to induce him to talk freely, but little of the poking-up that Young had suggested—to what was told us concerning the strange people among whom we had come by ways so perilous; and of their chieftain, the Priest Captain Itzcoatl—with whom, as no spirit of prophecy was needed to tell us, we were destined soon to engage in a conflict that must be fought out to the very death.

[TO BE CONTINUED.]

MONARCHS OF DOGDOM.

The annual exhibitions of dogs at New York, Boston, Philadelphia, Chicago, and other American cities have gained world-wide repute, and the specimen of immense proportions in union with correct type. The favorite colors are orange or orange tawny, with white front legs, breast, tip to tail, and blaze down the face, meeting the white collar on the shoulders. Dark shadings on the face are supposed to add greatly to the beauty of expression. Considering that Emmett, the actor, gave $5000 for Plinlimmon, and several other dogs of this breed have been imported at sums ranging well into the thousands, and that over $8000 has been refused for another English dog of this kind, it is evident that this breed is very highly esteemed.

The *German Mastiff or Great Dane* is a dog with many names. In America the newly formed club at Chicago has adopted the former; in England he is known as the great Dane, or boar-hound, whilst in Germany he is called boar-hund, Ulmer dogge, Deutsche dogge, or Daniske dogge. Hitherto he has not been well known in America; and until Germany's great Chancellor lost his favorite "Reichshund" many did not know of the existence of a dog indigenous to that country. Credit is undoubtedly due to the Germans for the preservation of these dogs during long years of neglect in other countries, but dogs of their conformation were common to the north of Europe, and especial care was taken to increase their agility and usefulness in the Danish provinces, which resulted in these dogs being called by several names, including that of the great Danes and boar-hound, and in there being distinct types. There is every reason to believe that they were all descended from the "dogs of war" used by the ancients; and it will be remembered that at the siege of Corinth fifty of these terrible dogs were stationed at an important outpost, and on the enemy landing they immediately attacked them, fighting till but one remained alive, and he, named Soter, fled and woke the drunken garrison, and thus saved the city. The ancient Grecian fortresses were all guarded by dogs, and there are many instances of their being used in battle in the ranks with the warriors. A bronze figure found at Herculaneum, and now in the museum at Naples, represents one of these dogs wearing mail. As civilization deprived them of their vocation in the south of Europe, they were driven north, and there utilized for clearing the forests of the wild-boar, and eventually they were used as watch-dogs and guards. Generally speaking, they have kept pace with civilization; and from the terrible dogs of war have been produced the companion of the child and the trusty watch-dog.

Attached to the different European armies are now corps of trained dogs, which will in the future be used to carry despatches and ammunition, as well as being utilized for outpost work. As a protection to the camp, these powerful German dogs are found to be particularly suitable.

The *English Blood-hound* has been talked of considerably of late, and many, viewing the dog from the *Uncle Tom's Cabin* stand-point, consider that he has an insatiable thirst for blood, and that were he used for tracking a fugitive he would proceed to tear him to pieces, and satisfy his thirst or hunger by devouring him; whereas were he put on the track of any one, on reaching him he would merely do as any other good-natured dog would, and exhibit every sign of pleasure. When it was customary for the Scottish gallants to visit the windows of the north of England gentry, and lift a whole drove of cattle at a swoop, the splendid noses of the sleuth-hounds were called into requisition; and the mode of hunting them in those times is aptly and quaintly described by Dr. Caius: "These houndes, when they are to follow such fellowes as we have before rehearsed, use not that liberty to raunge at will, but being restrained and drawne backe from running at random, by the leasse, the ende whereof, the owner holding in his hand, is led, guyded, and directed with such swiftenesse and slownesse as he himself in haste would wish, for the more easie apprehension of these venturous varlets." It is very questionable with those hounds which have been bred for generations without the use or development of their natural faculties, whether their sense of smell has not been lost to a large extent, yet it is maintained by their breeders and those interested that these qualities are merely dormant, and can be brought into play at any time; but those who have seen the blood-hound trials in England, and also witnessed the unerring scent of somewhat similar dogs which were introduced by the old Spanish cavaliers into South America, will agree that just as it is necessary to secure sporting dogs from strains noted for their good field qualities, so it is with the blood-hound; and although their faculties may be only dormant, it will require successive generations of properly trained hounds to insure a complete awakening; and it is very doubtful whether humanitarian sentiment will not prevent this grandest of the hound tribe from being anything more than a relic of the past.

The *British Bull-dog* conveys a somewhat different feeling, but even here there is a touch of the vicious; and yet, generally speaking, the bull-dog is as harmless as any lady's pet, and there are many terriers that would give him a hard fight. He is certainly a very repulsive-looking animal. If set on, it is a difficult matter to calm him; and once he takes hold, the formation of his jaw is such that there has to be almost an unlocking of the jaw in order to make him leave hold. In olden days he was used for baiting the bull, and his inherent disposition to go for and hang on to the most vulnerable part, the bull's nose, made him unsurpassed for this purpose; but since the law forbids such practices, he has been used for the improvement of other more useful strains of dogs.

It is astonishing that whilst Americans are giving such attention and investing so much capital in foreign dogs, they have allowed the only native dog of real excellence, the *Newfoundland*, to be neglected. He is perhaps more useful than ornamental, and yet he combines the grand form, intelligent expression, and massive proportions of the St. Bernard, with the noble devotion and power of the mastiff, and his almost amphibious nature gives him a superiority with which none can vie, making him the dog *par excellence* for our sea-coast and lake districts. This refers to the highest types of the breed and not to the curs of uncertain origin, which are called by the name of Newfoundlands. On some parts of the English coast the fishermen keep these dogs for the purpose of landing their spoil, and without them it would sometimes be impossible for the boats to get ashore. On nearing the shore a log of wood is thrown overboard with a rope attached to it, and this is fetched by the dog from the beach, and the boats are drawn in with it. For watch purposes the Newfoundland is excellent, and many are the accounts which could be given of his fidelity.

Canine Dudes.—Following the example of Paris and London, American belles are now adopting the *dernier cri*, or latest fashion, in regard to their canine pets, and the French poodle now seems to be the favorite. The little black and tan had his day, and has been consigned to oblivion. With the fall of the black and tan came the elevation of the pug—"so cute, you know"—all the way from China. But soon the expression on their short faces and the elegant curl of their tails became quite common, and the little sensitive pug, but lately the pet of their fair owners, was now considered quite too common for the parlor, and John, the coachman, could very well find a snug corner in the coach-house for him, for, "you know, Miss So-and-so has a French poodle, which she brought from Paris, and there it is the correct thing. Besides, they are too cunning for anything, and you can get them in black or white, trimmed in the latest style, with bracelets, tufts, and mustaches, so elegant, you know." So a real French poodle supersedes the pug, and thus are the sensitive little pets made tools of fashion. As yet, though, extremes have not been touched, and the sublime heights of the Parisian belle have not been reached. In France the ladies on visiting the sea-side or springs take their pets with them, arrayed in a dainty little travelling robe, consisting of a covering like a diminutive horse-cloth, with a pelisse bordered with colored ribbons. On their arrival at the summer resorts this is substituted by a light-colored mantle or jersey, with pockets in it for holding lumps of sugar, and a handkerchief wherewith canine snouts and eyes are wiped. The more advanced also bedeck their pets with collars and bracelets, so that they assume quite a dudish appearance, and look down with contempt upon the less-favored of their species, just as their fair owners adopt a more distinguished style. The latest fad in collars is a strip of reddish brown leather, with gold knobs, and garnished with little bells, bearing on one side of them the effigy of "Jean qui pleure," and on the other that of "Jean qui rit." The bracelets are of varied patterns, and are made to please the most developed tastes, nothing being overlooked in the endeavor to pamper the fancies and whims of the fair owners.

The education of their pets has not been neglected either, and besides shutting the door, begging, carrying, and fetching, some are quite advanced, and may be considered quite finished in every way. These dogs are naturally remarkably intelligent, and, as in the case of Lady De Clifford's black corded poodle, the coat is one mass of curls. Formerly these dogs were used for duck-shooting, and their wonderful skill in acting as decoys was simply marvellous. At times they would remain for a long while almost motionless in the water, with their black noses just above the water, and the long cords spread around like sea-weeds; with great caution they stealthily push the game on to the point where their masters lie hidden, gun in hand. When well within range, a signal is given, and then they half raise themselves out of the water, when the frightened birds take wing, many of them to quickly fall again, to be caught and landed by the faithful and well-trained dogs. Their almost human intelligence and pluck has caused their use in the smuggling of lace over the frontier from France into Belgium or Spain; and numbers of them are now trained for the purpose of conveying despatches in war-times. The fashion of clipping must be very old, for books printed in 1555 represent them trimmed; and there are sculpture bass-reliefs presenting them thus as early as the reign of Augustus. It is not an instance of wrong breeding when a coat with curls like the negro's head is found in place of the long ringlets, there being two kinds.

The *Schipperke.*—Not long since a desperate attempt was made to introduce a dog resembling the Pomeranian, with the singular name of Schipperke, and many found their way to America; but in this instance England was found to be a better market, and the dollars were not forthcoming for a Belgium "ratting terrier" specially constituted for out-of-door life, and until then the companion of the boatmen and lower classes in his native country. It was shrewdly considered that he had but few recommendations as a lap-dog; and his name and tailless condition were not thought to be such an overpowering charm to Americans.

The *Italian greyhound* has always had some votaries, his chief attractions being symmetry and grace.

The beautiful *Yorkshire terrier* is also an old favorite, his smartness and size, combined with a beautiful coat of great length and lovely tints, will ever gain for him a warm shelter and the care of all admirers of the charming and beautiful; and were it possible to insure the combination in this climate for any length of time, they would be invaluable.

The *Fox-terrier's* vocation was that of dislodging Reynard from places inaccessible to the fox hounds; but as it would now be impossible for him to keep pace with the hard and fast riders who follow the hounds to-day, or live with the hounds they use, he has to a great extent been deprived of his vocation; but being of general utility and companionable, he has continued to find admirers, and of late he has become quite a favorite with those of the fair sex who are admirers of pluck and grit, and who are not very partial to the dudish in dogdom. Although his readiness for a scrap with any of his kind, without much regard for strength and size, would seem to be objectionable in a lady's companion, still the fox terrier is undoubtedly a favorite with the ladies of to-day, and particularly in America.

Small Brussels Griffons.—The Queen of the Belgians has taken great interest in these dogs, and has done much to make them a favorite not only in their native country, but abroad. She took a large party of royal and distinguished visitors to a show recently held at Brussels, and surpassed even the judges in her knowledge of the excellence of the various exhibits. As yet the Brussels griffon has not received a very hearty reception abroad.

Toy spaniels being so admirably adapted for ladies' pets, and combining, as they do, all the beauties of coat and tint of the Yorkshires, with good size and quite an aristocratic bearing, it is more than probable that, as in England, they will outlive the fancies of fashion. In the time of Charles I. and II. the King Charlies were the favorite at court; and it is very interesting in more ways than one to know the skill of Charles II. in getting up an advertisement for a lost dog. It was inserted in the *Mercurius Publicus* of 1660, and ran as follows: "We must call upon you again" (a previous advertisement had appeared) "for a black dog, between a Greyhound and a Spaniel, no white about him, onely a streak on his Brest, and his Tayl a little bobbed. It is his Majesties own Dog, and doubtless was stoln, for the Dog was not born nor bred in England, and would never forsake his Master. Whosoever findes him may acquaint any at Whitehal, for the dog was better known at Court than those who stole him. Will they never leave robbing his Majesty? Must he not keep a Dog? This dog's place (though better than some imagine) is the only place which nobody offers to beg." The King Charles spaniel should be black and tan in color, without even a streak of white, and should be about seven pounds in weight.

The *Blenheims* are similar in shape and size, but are lemon or orange and white in color. They derived the name from the seat of the Duke of Marlborough—Blenheim Palace—and were almost as popular as the King Charlies, sometimes called Prince Charlies. The present duke's consort has taken a great interest in these little pets. She won the first and a special prize quite recently at one of the English exhibitions with some very charming specimens. The dog found concealed in the garments of Mary Queen of Scots after her execution was of this variety, and Queen Elizabeth and other royal and noble ladies have favored this breed.

The *ruby spaniel* is similar, but in color being a golden red, from which the name is derived.

The *Japanese spaniel* is also very similar, and generally a dark liver or black and white in color; the chief differences is a smaller and less pendulous ear, and a peculiar expression, which can be better seen than explained. These dogs are very rare and hard to raise, and consequently many that are not true bred are passed off as "Japs." In their native country they are carried in the ladies' sleeves, and hence are very small, generally weighing not more than four to six pounds.

In Mr. Simon's sketch on the front page of this number of the WEEKLY is given a fine young St. Bernard just in that happy period which the lady judge, Miss Whitney, so aptly termed "neither hay nor grass." He had never been to a show before, so after the visitors had gone home and all was quiet, or rather there was a little less noise than usual, he got loose, and determined to make the acquaintance of some of the dogs he had heard so much of. His nearest neighbors were the larger breeds, and they had little to say for themselves, and his presence was only hailed by a look of dignity. Next came the hunting dogs, that would scarcely notice a purely ornamental sprig of dogdom of any dimensions. So on he went to the dudes, only to be greeted with a look of unutterable contempt from the dandy poodles. But the pugs were more cordial. They twisted their tails into the orthodox curl, and carried their ears just as their fair owners would like to see them in the ring when the prizes were being awarded. Next he visited the toy spaniels, who would not deign to rise from their comfortable beds to give him a welcome. So on he went to the terriers. Oh, what music greeted him here! These were the dogs that had so much to say for themselves, and now their expressions were being made in very positive terms. Although neither of them was much more than a mouthful for the monster they snarled and barked at, yet each seemed to say that were he at liberty the intruder's inquisitiveness would be finished with one snap of his little jaw. Not being disposed to cultivate their acquaintance, he leisurely strolled on to the bull-dogs. Without rising, these repulsive-looking fellows opened one eye, and seemed to critically estimate the youngster's powers for harm, and then settled down again to calm repose. None seemed to be desirable companions, and he was just making for his place again when he was greeted with a peal from some dogs with savage expressions and pricked ears, with a sign over them marked "bull terriers." This was enough. Man had outdone nature, and combined the fiery combative nature of the terrier with the tenacity of the bull-dog, and then clipped the ears to heighten and intensify the expression. So, putting on an air of dignity, he calmly passed them by, and seemed contented to be a big, innocent, docile, ornamental St. Bernard, and thanked goodness he was not as other dogs were. E. H. M.

HOW UNCLE SAM MAKES HIS PAPER-MONEY.

(Continued from page 114, Supplement.)

tint, which in this case was printed in blue ink. Other colors, like green on disbursing checks, and yellow on requests for transportation for the Quartermaster's Department, are also used. In case of beer stamps, the color of the tint indicates their denomination.

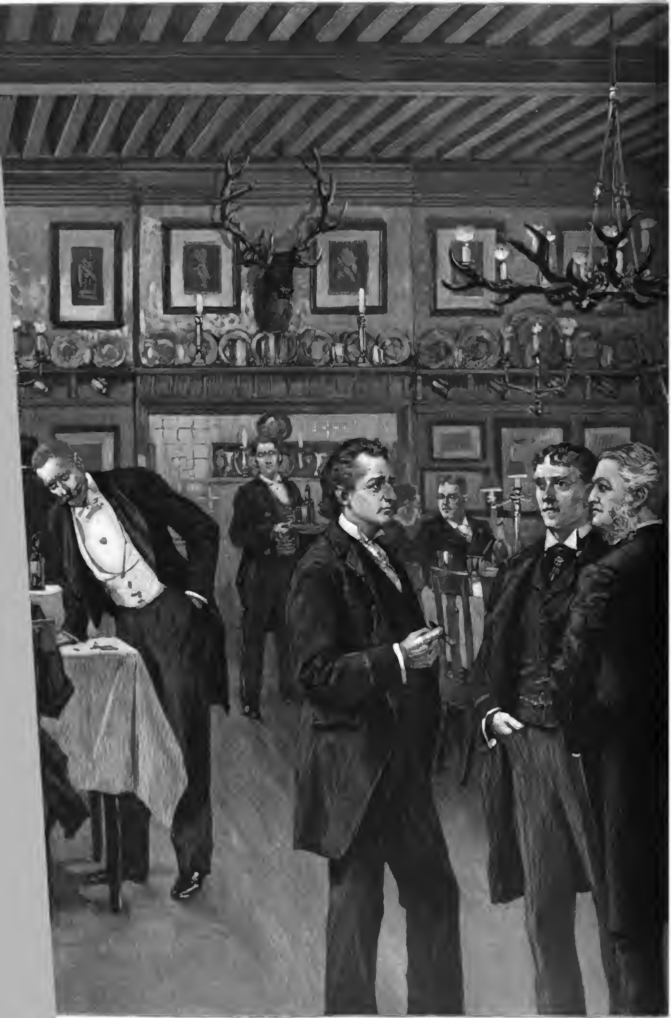
The other processes carried on in the bureau are in no way connected with the protection of securities against the skill and rascality of the counterfeiter; their object is simply the convenience of the public. In order that the strip stamps on cigars and cigarettes, for example, may be the more easily detached, the sheets are perforated; revenue stamps of larger denominations, as well as checks, drafts, and warrants, are made more portable by being bound into books. Certain kinds of work, like pension checks, are both perforated and bound, while other kinds, like cigarette stamps and fee stamps for the New York Custom-house, are gummed. All these processes belong to the binding and perforating division, which also trims and separates such work as requires it, and all, except the binding, are facilitated by the use of machinery.

The protection of securities against loss or theft is constantly present in the minds of the officers of the bureau. They omit no count and no lock to insure perfect safety, and so successful have they been that during the administration of Mr. Graves not the smallest loss occurred. In the printing division, therefore, vaults form, as in the engraving division, an indispensable adjunct. Every incomplete sheet, like every incomplete die or plate, is placed in them at night. Checks and stamps of small value are deposited in the locker-like safes along the sides of the hall on the second floor, and in the basement near the binding and perforating division. The more valuable work, like notes and bonds, is deposited in the large vault near the examining division.

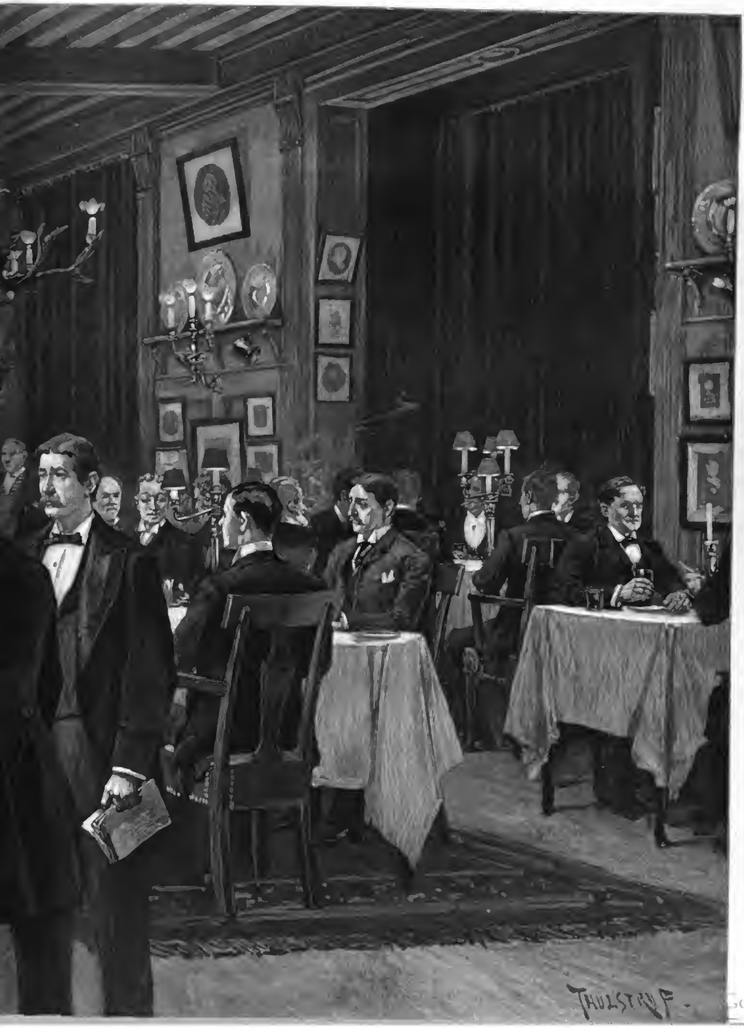
As I have already said, all completed work goes to the vault division for delivery to the Treasury. Had the bureau been built in accordance with Mr. Clark's plan, the transportation of securities to the Treasury would not have been the stately and interesting affair that it now is. Many visitors going to the bureau have doubtless observed rolling out of the yard, behind a spanking team of horses, a large covered wagon resembling a moving van, and wondered what it could possibly be. Inquiry always brings out the fact that it is "the security wagon"; that it carries the printed securities from the bureau to the Treasury; that it is plated with iron to make it fire-proof; that it is surmounted by a guard to protect it against the assaults of any highwaymen that may be bold enough to attack it on the streets of Washington. In it also is carried to the bureau the blank paper stored in the sub-basement of the Treasury. In it, too, is brought back to the bureau the worn and mutilated currency that has been returned for redemption; for all the notes printed in the bureau that are not lost in circulation come back in from two to four years to be destroyed under official supervision.

Ignoble as the last end of these pieces of paper is, visitors to the bureau are always eager to see it. Like them, I was unable to resist the temptation to witness the solemn ceremony. In company with ten or fifteen ladies and gentlemen, I went one morning about half past eleven o'clock to a room in the rear of the laundry. The Destruction Committee of the Treasury, with their old and decrepit treasures, had not yet arrived. We had therefore twenty minutes or more to look about. Through two large round holes in the floor we saw two great cylinders of the size of locomotive boilers, called macerators. Into these cylinders the worn-out notes, imperfectly printed securities, etc., are poured, by means of funnels inserted in the holes through which we were looking. After they are mixed with lime and soda-ash, caps are placed over the ventricles, and fastened with a separate lock and key by each of the three members of the Destruction Committee, the steam is turned on, and the cylinders set in motion. When the notes are thoroughly macerated, the mixture is drawn off into a stone trench under the cylinders, pumped up to a paper machine on the floor where we were, and manufactured into thick sheets of paper, which are made up in packages, and sold to paper-makers. Some of the pulp of notes is cast into images and other forms, and sold in the fancy stores in Washington to the relic hunter. The fabulous figures marked on them to indicate the face value of the notes in them seldom fail to stimulate his imagination and inflame his desire for possession.

In the mean time several boxes, securely fastened, have arrived; later followed the Destruction Committee. A large funnel is inserted in one of the holes in the floor, and on a table drawn near it are emptied the contents of the boxes. The spectators crowd around, and watch every movement of the committee. With rude and inconsiderate haste the members cut the packages of notes, and push them into the mouth of the funnel. When it becomes clogged, one of them seizes a long stick and clears away the obstruction. Finally the last packages are reached, ripped open, and thrown after their fellows. As I turned away with a feeling of melancholy I saw a pretty woman, clinging to the arm of the gentleman at her side, look up into his face, and exclaim, in a low voice, "Oh, Harry, doesn't that seem too bad!" And I could not help thinking that it was the ignoble end of these old and most faithful of friends that millions of men and women struggle for from morning till night, that they fight for, that they die for—that it was the thought of the tales of battle and intrigue, of toil and crime that each might tell if given a voice, that brought the glistening dew to her soft brown eyes.



A SATURDAY NIGHT AT "THE PLAYE



Google

the world through but a scene of mirth; The Players have the first and best of it—they are in at the drawing of the cork. William J. Florence, scenting a good story, joins the group, and very soon the smile broadens into a laugh, for Florence is ready to pay his footing in any company where a merry jest passes current. It would be pleasant to retail some of the "good things" that float so lavishly in the air of this brightest of clubs; many of them would stand the wit-withering ordeal of cold type; but it may not be. Over the broad, open fireplace, in quaint old characters that wink in the flickering light of the glorious log, stands an admonition which no Player may disregard.

> "Good frends for Friendship's sake forbeare
> To utter what is gossipt heare
> In social chat, lest unawares
> Thy tonge offende thy Fellowe plaiers."

Now, in close converse, enter Stanford White and Henry French. Perhaps some weighty detail concerning the management of the new building on Madison Square is in course of adjustment between them; perhaps they are only talking at large, for all subjects are tolerated here except shop—that is to say, shop of the outside world, for art shop is a staple. But woe to the merchant who talks of "the market, and woe to the broker who babbles of "the street." They receive scant mercy; yet will Brander Matthews and Laurence Hutton gossip by the hour on rare and curious bindings—ay, and on the literary treasures those bindings may enclose. They will appeal to Beverly Chew as to an expert, and will draw in T. W. Dewing when it comes to a question of illustration, and none will reprove them. So, in like manner, will William H. Crane lay aside his Senatorial dignity and compare notes with William F. Owen of the irresistible laugh on the proper conception of the character of Sir Toby Belch, and no one will resent their conversation as smacking of the shop. But the broker and the lawyer and the merchant leave business behind them, and bow to the superior advantages of Art—at once the recreation and the livelihood, the business and the pleasure, of her votaries.

And still the rooms continue to fill. It is early yet, not much past midnight, and the groups each moment grow larger and more frequent; the pensive haze of cigar smoke settles down more thickly, obliterating rude angles and blending all the figures into the tone of the picture. It is a picture full of life and motion, as the little knots gather, disperse, and melt into one another with true clubbable fraternity. The Players are out in force to-night. Some are seated or reclining on the broad crimson divans and sofas ... never before were there collected ...

years is long enough to wait? If I couldn't go to-morrow, I couldn't stand it anyhow. If Emeretta can't come and stay with grandmarm, I must go down and get Lucy Fernald. 'Tain't any odds if I have to pay her."

As she uttered this last clause, Calista was conscious that she was a desperate woman. But the consciousness brought with it such an elation that she laughed aloud. "I don't expect I ever see the time when I darst to say such a thing before in all my born days," she said to herself.

As she passed the lighted windows of her living-room she stopped and looked in. Grandmarm sat beside the cheerful fire that burned in the old-fashioned Franklin-stove, knitting and talking and nodding. Grandmarm had had a slight shock of palsy, which caused her to nod like the Chinese mandarin in front of a tea store. She was almost as proud of this as of the fact that she was ninety years old; it was, in fact, a more satisfactory distinction, since no one could call it in question, while grandmarm had quarrelled hopelessly with two of her oldest friends because they promulgated skeptical opinions concerning her age. Nancy Pettis, whose son kept the poor-house, a social centre in Hebron, could show by numerous dates, from the burning of 'Siah Griffin's barn to the Millerite preparations for ascension, that grandmarm was but eighty-seven, while old Captain Baron West, who "sat in the store"—a form of recreation that took the place of the operas and dinner parties of a less primitive civilization—could bring forth incontestable proofs, starting somewhat oddly but impressively from the date of the Lisbon earthquake, that she was just eighty-eight. Each time that these heresies were freshly revived, grandmarm was threatened with apoplexy.

Grandmarm was a little woman, and she wore a red flannel skull-cap on her small round head, which was as bare as a robin's. the neighborhood children all thought that the red skull-cap added to the fascination of her nods. She had a most decorous black lace cap which Calista ran for when the minister called. Grandmarm sternly refused to don it for any other occasion. She talked constantly, unconcerned whether any one listened, in a high-keyed voice, cracked like an ancient bell. Grandmarm nodded over her knitting, and the black kitten in the rocking-chair opposite her nodded too, dreaming and awakening with jerks; the floor shone with yellow paint and cleanliness in the spaces between gay home-made rugs, and the fire-light danced in cheerful shadows on the wall.

"It's real cozy," said Calista to herself; "but I have been so dreadful mortified havin' to take

ly, said Calista, as placidly as if ... first time she had said it instead of the fifteenth. "She writes short-hand in a lawyer's office; and bein' she's used to city ways, I thought I would—would kind of furnish up the front room for a parlor before she came."

"A parlor? I don't know what you're a-talkin' about, C'lista. I don't know what you want of a parlor, without you're a-calc'latin' to have a weddin' or a funeral, and I ain't a-goin' to help you out on neither one of 'em. And if I was, I ain't too proud to be buried out of this settin'-room. And I should like to know what you'd do with the brain board and the clo'es-horse, and your quince jell and barberry preserve, and it is comfortin' to me to know that I can go in the dark and put my hand right on the old bellowses."

"They could hang right where they be, grandmarm," said Calista, eagerly. "It's real fashionable to gild 'em and tie a blue ribbon round 'em. The minister's daughter has got a pair that's fixed so."

"Cat's foot!" said grandmarm, with intense scorn. "Them bel- ... are mine, and when I want 'em cock-turkeys that way I'll let you know."

"There's a good many things that I never felt like hangin' up here, where folks come and went so free," said Calista, discreetly leaving the bellows to an uncertain fate. "There's 'Sacred to the Memory of Uncle Pliny,' all worked off in worsted and in a beautiful pop-corn frame, and 'Washington crossin' the Delaware,' and the wreath that was made of little Pliny's hair, and the coffin plates, that would look real handsome on a parlor mantel-piece instead of hid away in a drawer, doin' no credit to anybody."

"You was always fond of show, C'lista. You got it from the Bolton side, 'long of your crooked nose. Your aunt, C'lista Bolton, that you was named for, wouldn't eat a mite of rye or Injin, and used her best chiny every day. I shouldn't be surprised if you was a-thinkin' of stuffed furniture."

"Hair-cloth is real durable," said Calista. She stifled a little sigh. Her aspirations had soared toward plush, but she had clipped their wings, having a realizing sense of the danger of being carried away by worldly vanities. Hair-cloth, with its durability and its uninviting aspect, had something of a religious character to Calista's mind. Thrift was almost one with godliness in the faith in which she had been reared. She would have been r... ly to admit that plush and lax religious views would be apt to go together.

"If you was a girl, and somebody was keepin' company with you, I should know what you

Nancy Pettis will be tryin', but she can't be no more so than some other folks."

Calista patiently rehearsed the story of her recent good fortune, which grandmarm had heard at least a dozen times, but she still held to her resolve not to give way to grandmarm. Her courage mounted with the occasion, so that she went to sleep that night, with the door open between grandmarm's bedroom and her own, while grandmarm was still talking, in a high-keyed, excited voice, about the downward career of Lot Pettigrew's extravagant wife, who finished by driving her husband to suicide by means of—thrilling culmination!—a set of stuffed furniture.

But grandmarm had forgotten all about the proposed parlor in the morning, which was very comfortable if one could forget that the scene, with all her tears and objections, would have to be repeated. She had happened to think of Lucretty Spencer and the time when she and Lucretty went on a sleigh-ride with Job Stilson, and the drifts were so high that Job had driven them right over old Mis' Sackett's one-story house, and old Mis' Sackett had thought it was the day of judgment. That had happened when she (grandmarm) and Lucretty were just sixteen. Didn't Calista remember it?

Grandmarm laughed softly at this recollection all breakfast-time, and afterward her good nature was increased by the arrival of Emeretta Mann, who was fourteen, and always flattered her by fixing a fascinated stare upon her nodding head. She had forgotten that Calista had given up dress-making, and thought that she was going to the city for patterns.

It was a great day for Calista, and a happy one, although her recklessness almost savored to herself of irreligion, especially when she bought furniture of light gray hair-cloth instead of black, because the clerk assured her it was just as durable, and it looked more cheerful. After that she went back and changed the gayly flowered carpet she had bought for a more sombre one. But she said to herself that she would have an organ. All the people in Hebron who were "thought anything of" had either organs or pianos in their parlors. Calista had never aspired to a piano. An organ was less expensive, and also less light-minded, than a piano. Delight would be sure to learn how to play, and she herself might learn to pick out her favorite tunes—"The Sweet By-and-by" and "The Evergreen Shore." She enjoined strict secrecy upon old Mrs. Tapley when she stopped, on her way home in the stage, to ask her to come and help her make the carpet. When she had her own way curchey to more or less, for the sake of livin' peaceable. I don't know as it's any more apt to be a man than a woman. I declare I don't know but what I've seen more women than men amongst them that thought the world was made for 'em. Beats all what a yoke relationship can be! And yet there ain't but very few that seems to be afraid of matrimony. I've always thought 'twas real fortunate that Mis' Maxon hadn't no children; some of 'em would have been sure to take after their father, and then she'd have had more'n one to curchey to."

Calista heaved a little sigh. She knew what it was to "curchey" to other people's wills. She had been doing it all her life. Over some to whom she had been subservient the grass grew and the rain fell as it would. She could not "think hard" of them. She had seen the others go "out West" to homes of their own with mingled sorrow and relief; they were her own, and Calista had a loyal soul. Now there was grandmarm. Calista clung to her with an affection at which many wondered, knowing grandmarm's "trying" peculiarities; and it had been hard to withstand grandmarm's tearful objections to the parlor; but Calista had not repented as she sewed with stiff fingers on the carpet, which was hard to match.

The carpet was finished and put down the next day, and the new stove, an air-tight with a profusion of nickel trimmings, came, and was set up. When the furniture was unloaded at the door, there was a great neighborhood sensation. The Mayo children, who had the whooping-cough, ran out of doors bareheaded, and Mrs. Isaiah Pitkin pulled up her green paper parlor shades that had not been touched for a year, and Mrs. Deacon Mann put her shawl over her head and went over to Mrs. 'Siah Pingree's. When the gray hair-cloth furniture greeted grandmarm's eyes she took her bed and sent for the minister. Calista's soul was shaken with a sense of guilt, but, nevertheless, she arranged her furniture with resolute hands, and hung up her treasures: the funeral memorials, "Washington crossing the Delaware," a motto "Home, sweet Home," and an "air castle" of beads and worsted, which she had made with great painstaking in her few leisure moments, and when the parlor was but a vague hope. Emerette Mann had told her, with the unfeeling candor of extreme youth, that "air castles" were all out of fashion, and mottoes were going out; but Calista decided that she would not discard her works of art. They were full of sentiment for her, she had treasured them so long, and they were really beautiful, she thought, whatever might be the fashion.

In a few days grandmarm had forgotten that they had not always had a parlor. She blamed Calista querulously for "tryin' to hide her away in the back part of the house, and never bein' willin' that she should set in the parlor winder and see the passin'. She wa'n't so old but what she could feel it when folks was always manœuvrin' to keep her out of the parlor. And she didn't know how Calista reconciled such treatment of the aged with her Christian perfession."

But the new stove would not "draw," and grandmarm took cold. The chimney had to be cleaned, and that involved a long delay, and Calista had the organ moved out into the sitting-room, and also the gray hair-cloth arm-chair, which grandmarm liked.

Delight had written that she had failed to get her expected vacation, and must postpone her visit until spring. When a fire could be built in the stove, it seemed scarcely worth the while. Grandmarm declared, with tears, that Calista had designs upon her life, when she wished her to sit there where she had taken such a cold. On Sunday afternoons Calista built a fire in the nickel-trimmed stove, and sat by the window with her Bible and her Sunday-school paper; but it was not home-like and cheerful like the sitting-room. She was conscious of a feeling of relief when tea-time came. And after the neighborhood curiosity had been satiated, every one would come as usual to the back door, and step into the sitting-room as a matter of course.

"The pleasures of the world is deceitful," Calista admitted to herself toward spring. "There 'ain't been skurcely a mite of comfort in that parlor. I ain't half so happy as I was workin' hard at dress-makin' and longin' for it. Mebbe it's come too late."

One day in the early spring Squire Maxon alighted from his wagon and came around to Calista's back door. He was a tall man, with a large nose, thin lips, and cold gray eyes, and an important air, which he seemed to make genial by an effort.

"It must be the rest of the swamp land. What can it be?" said Calista, all in a flutter, for, except at a wedding or a funeral, Eben Maxon had never been in her house before.

He sat down in the sitting-room without explaining his errand, and addressed himself to grandmarm. "A pretty hard winter for old folks like you and me, ain't it? Lonesome too, up to my house. But I s'pose we've got to stand it."

Grandmarm fell into reminiscences, in which the squire persisted in setting her right, until they threatened to quarrel. Then he turned to Calista.

"You don't seem to grow old much, C'listy; cheeks jest about as red as they used to be when we sat in the singin' seats. They don't have no such singin' there nowadays."

"If her cheeks is red, it's because she's been a-cookin' over the stove," said grandmarm, with uncompromising candor. "She's forty-four and she looks her age, every day of it. The Boltons were always jest so peaked."

"I heard you was goin' to have company, and I thought I'd ask you to fetch her up to my house. It needs livenin' up."

Squire Maxon arose, and Calista went with him to the door. In her uncertainty as to what grandmarm would say next, it was a relief to have him go. He turned and faced her, with his back against the door.

"Well, what do you think of a match between your family and mine?" he said. "They're good families, now, ain't they? No better in Hebron. And you and I used to be good friends when we were young, if we 'ain't seen much of one another since."

No fire could make Calista's cheeks so red as they were now; her light blue eyes, faded with many nights of stitching, dilated as she gazed at him.

Had it really come at last? Was Eben saying to her what her "hopeless fancy had feigned" so many times? It seemed like something heard in a dream!

"I—I never expected it. I can't say right off sudden like this. I—I'll let you know," she stammered.

"Oh, take your time! I don't s'pose it 'll make much difference what the old fogies say. And it's my opinion that folks have a right to suit themselves about marryin'. There's Dr. Bemis, and I want to see him."

Squire Maxon hurried off, and Calista went, with shaking knees, and dropped down upon the parlor sofa. His words repeated themselves over and over in her mind.

"He meant that I mustn't let grandmarm interfere with me, I expect," she said to herself. "How blunt he come out with it! He never said he thought anything of me, nor nothin'. But then that would be kind of ridickerlous—such old folks. Beats all how different it seems from what I should have thought it would! Seems as if Eben wa'n't Eben, and I wa'n't myself. I expect I wound a gauze round him when I was young, and time has wore it out. If I should have him I b'lieve 'twould be jest like the parlor. And yet I be lonesome, and 'twould be kind of consolin' to set up at the head of his pew, and have folks know that I wa'n't one that couldn't get anybody to have me. Worst of it is he ain't Eben."

Squire Maxon, after an interview with Dr. Bemis concerning some lumber, which drove all thoughts of his recent visit out of his mind, was suddenly reminded, as he drove into his own lane, of Calista's behavior, which had struck him at the time as being very singular.

"By George, if that wa'n't it!" he exclaimed, suddenly, bestowing a vigorous thump upon his knee. "I thought I knew something about the vanity of women-folks, but I never thought that that crooked-nosed little old maid could get it into her head that I wanted to marry her! I thought I was bein' pretty condescendin' in givin' my consent to my nephew's marryin' her niece. Can't be she was givin' herself such airs about that? No; she wouldn't have been so worked up as that about her niece anyhow. She'll let me know! Good land! a pretty fix I've got myself into! If I was a marryin' man that's about the last woman—"

It happened that a surprise awaited Squire Maxon when he entered his house that day. Mrs. Snowden, who had kept house for him during the two years of his widowerhood, announced that she had just heard of the death of her son-in-law, and had received an invitation to make her home with her widowed daughter. It was a severe blow to the squire, for Mrs. Snowden was a woman who obeyed orders and never spoke her mind—a woman after his own heart. And she was nearly twenty years older than he, a fact which made it certain both to her and to the gossips that he did not wish to marry her—a matter about which Squire Maxon was very sensitive. He was practical himself; and considering the practical advantages which he had to offer to a wife, he could not have believed that there was a marriageable woman in the town who would not be more than willing to share his lot.

Where could he find a meek and docile housekeeper who would not try to marry him?

Two days later, while he was still in the throes of uncertainty, and Mrs. Snowden's trunk was packed, he received this letter from Calista Peebles:

"DEAR SQUIRE MAXON,—I hope you won't think hard of me, or feel as if I wa'n't sensible of what a great honor 'twould be for me to be your wife, but I can't help thinking it's better for me to stay as I be. Perhaps you've heard that folks want me to have the post-office. They would have got up the petition jest as soon as it was known that Emerline Giles was going to give it up, only they didn't know as I'd be willing to give up my parlor to it; but I'd jest as leave as not, and 'twill be a sight of company for grandmarm and me." Here followed a sentence which was crossed out by heavy pen strokes. Calista had written, "There was a time, Eben, when I thought a sight of you," and then she had stayed her hand suddenly and upon reflection had crossed the words out. "He never said a word like that to me," she thought, with a touch of womanly pride. "I feel real honored, and I want you to believe it; but I don't want to marry you."

Squire Maxon read this letter over three times before he felt sure that he understood it. That poor, lonely, plain-featured, little old maid had declined to marry him!

"Well, I needn't have worried, and that's a fact," he said to himself. "I wonder what 'twas that she scratched out so carefully after she wrote it?"

He was suddenly filled with a curious interest in Calista. He was not sure that she was not an altogether new type of woman.

He found an ink eraser, after some difficulty, in the depths of his old-fashioned secretary. He worked away for an hour on the illegible sentence. The squire was a man whose bump of curiosity was largely developed. At last, by supplying a lost letter here and there, he was able to read, "There was a time, Eben, when I thought a sight of you." Squire Maxon blushed and laughed as sheepishly as a school-boy. He recalled the Calista Peebles who had sat in the singing seats, and remembered that in spite of her nose she was pretty. He thought of her, more or less, all day, and by the next morning he had decided upon what seemed to him the best way out of his difficulty. Calista was meek; at least, he would not be troubled by an attempt at "home rule," which was his great dread in matrimony.

In the mean time Calista had made a discovery. Her niece Delight had arrived on her long-promised visit, and in a very short time had confided to her aunt the important fact that she was engaged to Frank Maxon, the squire's nephew, who was studying law in the same office in which she was a stenographer. In a moment Calista saw the mistake she had made. She felt wholly crushed by shame when the squire's words, with their new meaning, flashed across her mind. One reflection had a little comfort in it.

"It ain't as if I'd said yes," she said to herself.

She could hardly force herself to go to the door when she saw the squire getting out of his wagon again.

"So you'd rather have the post-office than to have me!" were the first words he said.

"I tried to get the letter back," she stammered. "I—I don't know how I come to be so foolish as to think that you could mean—"

"I mean that I want you for my wife, that I think more of you than of any woman in the world. That's plain enough, ain't it? And I think you're just about as pretty as you was when you used to sit in the singin' seats."

The squire was overdoing things, no doubt; he was vaguely aware of it himself; but I am not at all sure that Calista did not, for the moment, believe him. But she only said,

"There's something that seems to suit me particular about bein' postmistress; it's real cheerful; and I 'ain't never been mistress of nothing, and I was always one that would have liked to have my own way consid'able."

Delight, who had no doubt that the visit was intended for her, came in just then, and the talk was all about Frank and the future prospects of the youthful pair. But as the squire was going away he called back to Calista:

"I'm comin' again. *I mean to have my own way!*"

But grandmarm, who awaked from a nap just as Calista returned to the sitting-room, remarked that she had "a terrible set look on her face."

"It's a dretful pity that you've got to sell the parlor furniture, C'listy," she said. "You won't get nothin' nigh what it's worth if Emerline Giles is goin' to set up house-keepin'. Folks won't pay for second-handed things. I remember when your mother furnished that parlor she give a sight for the things. Never was a Bolton that wa'n't extravagant."

"I expect I shall lose some money," said Calista; "but I've had the experience."

SECRETARY TRACY'S BEREAVEMENT.

By a fire, the origin of which at the time of writing is unascertained, the handsome Washington residence which General Tracy had rebuilt, altered, decorated, and furnished, and in which his family had been settled but a few weeks, was almost entirely destroyed, the wife, who had been a faithful companion for more than forty years, was killed, and the youngest daughter—talented, amiable, beloved by all who knew her—was suffocated to death, undoubtedly while trying to save her father's life. Mrs. Wilmerding, the widowed daughter, and her child were saved by jumping from the window of their bedroom to the ground, and, although sprained and bruised, suffered apparently no permanent injury. The Secretary himself, awakened by the alarm of fire, but not fully realizing its extent or danger, had started to dress, when, overcome by the smoke, he fell unconscious to the floor. His heroic wife vainly tried to move him toward the window, and when Chief Parris burst into the room, and, calling for help, carried him to where a ladder could be reached, she, bewildered, clambered out of a window, and, unable to hold on to the sill, slipped and fell to the stone area below. Only the most vigorous measures, promptly applied by the medical attendants, resuscitated the Secretary. To the list of dead must be added a French maid—a native of Switzerland, and a stranger in this country—whose escape was cut off from her attic chamber by the fire and smoke, and who was burned to death.

Messages of condolence and sympathy have been sent from almost every quarter of the globe. The Queen of England, the King of Italy, the President of the French Republic, expressed their personal sympathy, voiced for all foreign nations by their accredited representatives in Washington. State Legislatures, municipal corporations, Grand Army posts, and countless private organizations testified to the public sorrow by the kindest testimonials of their sympathy. Once again is "all the world made kin" by its presence, with words of comfort, at the side of those who are left. And no man brought more loving, brotherly sympathy and encouragement to the mourning husband and father, fighting for his own life, than the President, on whom devolved the task, which others shrank from assuming, of communicating to the bereaved Secretary the full measure of his loss.

The house in which the tragic scenes of Monday morning last took place, and which, with blackened walls, fallen roof, and staring, dismal windows, is now a marked contrast to the handsome residence bought by Secretary Tracy for his Washington home, is a three-story and attic brick structure, occupied during the last administration by Postmaster General Dickinson, and owned at that time by Paymaster Bacon, United States navy. It faced on Farragut Square, in a delightful neighborhood, with one of the most charming outlooks in the capital, over the flowers and shrubbery of the pretty little park, and up broad Connecticut Avenue to the heights beyond. The house itself from the outside was plain in appearance. Within, the ceilings were unusually high, the staircase broad and easy, the rooms large and well arranged. For the needs of his family, and the exercise of that generous hospitality the Secretary so much enjoys extending to his friends, the house seemed to him too small, and an addition was built on the eastern side, filling up the vacant space between it and the next house, and adding five rooms to its capacity. The mansard-roof was also removed, and the brick-work carried all the way up, thus giving an attic over the third floor. The first story was three rooms deep. In front, the library, panelled in handsome woods on walls and ceiling; east of it, the new drawing-room, handsomely decorated in white and gold; back of it, the reception-room, finished in pink and gold, where Mrs. Tracy and her daughters received their guests on cabinet days; and opening out of this was the large dining-room, with butler's pantry at the side. On the second floor the front rooms were occupied by Mrs. Wilmerding and her daughter, the middle room was the son's—who at the time of the fire was at the family's country home in Owego—and over the dining-room was the bedchamber, with bath-room adjoining, occupied by General and Mrs. Tracy. The front rooms on the third floor were Miss Tracy's. One she was using temporarily as a bedroom until her own was ready, and the latter, with her artistic skill and admirable taste, she was decorating and arranging to suit herself. Here after the fire were found left lying on a chair her palette and brushes, paints, and other materials, while on the head-board of the bed, spared in the general ruin, the skilful artist fingers had limned festoons of poppies and morning-glories pendent from true-lovers' knots. Back of these rooms were the servants' quarters, and in the attic slept the French maid.

On Sunday night, the second of this month, Secretary Tracy, who had been sitting in the library with his daughter, reading, retired to his room about half past ten. Mrs. Tracy came down stairs as he went up, and remained in the library perhaps an hour. Miss Tracy went upstairs about eleven, and was heard playing to herself on the zither—an instrument of which she was very fond, and on which she was an expert performer. At half past six in the morning the laundress and kitchen girl came down, lit the gas in the kitchen, called the men who slept in the basement, and while one of them went to church, the other pursued her usual duties. There was then no apparent sign or smell of fire or smoke. A few minutes before seven a colored man passing by on the other side of the street saw flames through the library windows. Ringing the bell, he informed the astonished butler that the house was on fire. Without any thought of the fatal consequences, the servant threw open the folding doors of the library, and the fire, which had originated in that room in some mysterious manner, and had been feeding on the oiled woodwork for no one knows how long, fanned by the draught, was drawn out into the hall. The frightened butler rushed upstairs and sought to arouse the household; then stumbled and tumbled down the stairs into the open air. The flames spread with terrific rapidity. The wooden panellings were at once the beauty of the house and its destruction. The alarm had been turned in, but before the ladders could be raised to the front windows, Mrs. Wilmerding, wrapping her daughter in her ulster, bade her jump, and immediately followed herself. They were picked up and carried to a neighbor's, where their bruises, which were fortunately not serious, were carefully attended to. A policeman, rushing in through the smoke, found the body of the daughter outside her father's door. She had started to dress, but had then rushed down to arouse her parents, when the smoke overcame her, and falling unconscious, she became an easy victim. The French maid perished in her own room, cut off from all escape by fire and smoke. Another servant was rescued from the cornice of the roof.

After Mrs. Tracy fell she was taken to the house of a Mr. Rheem near by, and here she lived for some time, perfectly conscious and free from pain, dying peacefully of rupture of the lungs, with a loving message to her husband on her lips. The Chief of the Fire Department, with the assistance of another, had taken the unconscious and apparently dying Secretary down the ladder and into Mr. Rheem's house, from which, as soon as able, he was removed to the residence of Bancroft Davis, and from there, on Tuesday afternoon, went to the Executive Mansion as the guest of the President, who had been early at his bedside, and had been constant and unremitting in his attentions and kind offices. At his desire the remains of Mrs. and of Miss Tracy were taken from the residence of Attorney-General Miller to the White House, and from there, with appropriate ceremonies, with as tender consideration as though from their own home, and amid the unrestrained sorrow of the gathered friends, were removed to a place of temporary burial at Rock Creek Cemetery receiving vault. The final interment will probably be at Owego.

Such are, in brief, the details of a calamity which has saddened Washington as but few events have ever affected it before. A nation's heart beats in sympathy with the sorely afflicted husband and father. His home was one of the happiest and brightest; his affection for his family a marked trait in his character; and their devotion to him noticeable at all times to those who had the privilege of their friendship. Mrs. Tracy was gentle, quiet, unassuming, beloved by all who knew her, and a great favorite within the official circle into which she had so lately come. Her quiet birthplace at Owego, New York, was her delightful retreat from the busy scenes of city life.

LEMING, GOVERNOR OF WEST VIRGINIA
a Photograph by Parsons, Wheeling.

ere each summer was always anticipated with e. Her long residence in Brooklyn had made all its citizens, and from the little town in west- d the City of Churches comes the same loving ction and of sorrow. Miss Tracy was like her eats. Petite of figure, a decided blonde in ap- the most winning manners, and a sweet smile for all. Her thoughtfulness for others became ss of self. Although in Washington but so had endeared herself to many, and Mary Tracy with all who knew her for all that was lovable s artist she had remarkable talent and skill, excellent musician. Unobtrusive, tender, con- le nature was ever prompting her to good deeds

imself has but a slight tenderness in the bron- reminder of the physical shock, but his mental picture or even imagine? The American people strong, and aid him with their sympathy and ue the work he has so well begun.

OVERNOR FLEMING.

lected Governor of West Virginia in November, n fifteen months to decide who that somebody atic claimant was Judge A. B. Fleming; the eneral Nathan Goff, Jun., ex-Secretary of the Navy. At first it was supposed that the State had gone for Harrison, and for Goff by a much larger majority, but as the returns came in it was soon found that Cleveland had carried the electoral vote. Finally the returns gave Goff about one hundred majority. A contest was at once begun. The Democrats alleged that hundreds of negroes, "colonized" from Virginia, had voted illegally for Goff. The Republicans claimed that the returns should be accepted at their face value. The contest in the Legislature was hot, but the Democrats finally won, and General Goff was not seated. When inauguration day came the Republican claimant took the oath as Governor, and tried to assume the office. Governor Wilson refused to give it up, and has held over, pending the result of the contest, until now.

For eleven months the Legislative Committee heard arguments and testimony on the case. Finally two reports were presented. The case was argued last week before the State Senate, and the vote at last stood—for Fleming, 42 Democrats and 1 Union Labor man; for Goff, 40 Republicans. Judge Fleming was thus at last entitled to take his seat. He has only two years now to serve.

The new Governor is a young man comparatively. He has distinguished himself as a lawyer and on the bench, and is personally popular.

TWO MUNIFICENT GIFTS.

On Thursday, February 13th, the magnificent building comprising a public library, art gallery, and music-hall, presented by Andrew Carnegie to Allegheny City, Pennsylvania, was opened with appropriate dedicatory ceremonies.

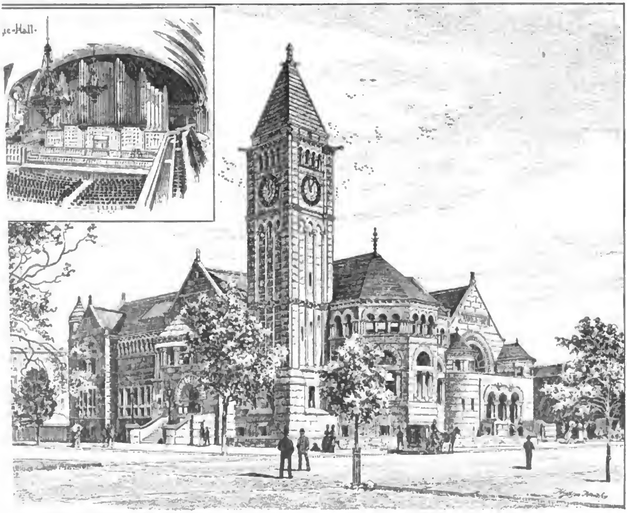
With the single stipulation that the city maintain it for the designated purposes, the structure, which cost $300,000, is an unconditional gift to Allegheny City. It stands opposite the City Hall, on the northeasterly one of the four parks, each 200 feet square, which William Penn gave to the city to be used for municipal purposes. These parks lie at the corners formed by the junction at right angles of the two principal thoroughfares, near the centre of the city. Allegheny City already has a large collection of books to serve as the nucleus of the library collection, and its citizens have begun to show their appreciation of æsthetic culture by the presentation of works of art to the gallery.

The building thus generously given, of which we present an illustration, is a massive, symmetrical, and beautiful fire-proof structure, built wholly of granite and iron. The plans were selected from a large number offered in a public competition. Smithmeyer & Pelz, the designers of the great National Library in Washington, were the architects chosen. The building was constructed under the direction of a citizens' committee, of which Mr. James B. Scott is chairman.

But this princely gift to Allegheny City has been surpassed by Mr. Carnegie's recent offer to Pittsburgh of $1,000,000 for the purpose of founding a central free library with several branches. In return for his magnificent donation he asks the city to pay $40,000 annually—four per cent. of amount invested in the buildings—for its maintenance, the money to be raised by taxation. Mr. Carnegie, who has spent much time in the examination and study of public buildings of an educational character, proposes first to construct and furnish a grand central library building, the books of which are to be used both for reference and circulating purposes. The central building, which is to be fire proof, will contain a fine room for the reception of works of art, it being intended by the giver that in time it will become a magnificent art museum. The building also will contain rooms for the meetings of the various learned and scientific societies comprised in the Academy of Sciences. The intention of Mr. Carnegie is to furnish rooms for such societies to meet in, leaving it for other wealthy men of Pittsburgh to raise a fund for scientific research. The branch buildings will contain portions of the circulating library from the main structure, and books are to be dealt out in the manner that experience may demonstrate to be most in accordance with the needs of the people. These branch libraries will contain rooms for reading and literary societies, and such other organizations as will lead people to read, which is the great object desired.

ALANSON W. BEARD, THE NEW COLLECTOR OF THE PORT OF BOSTON.—From a Photograph by Marshall.—[See Page 130.]

The proposition includes site and building of a monumental character, and it is intended that the central building and the branch buildings shall be models of architectural skill. As far as has now been determined, the Commission or Board of Trustees in the management of the library will consist of twenty-one members; nine of these, who will represent the city government, are to comprise the Mayor, the presidents of the Common Council, the Select Council, and the Central Board of Education, and five members of a Library Committee, to be appointed by the Councils; and twelve citizens, to be chosen by the giver of the fund. The twelve citizens upon the commission will provide for the election of their successors; and the officers representing the city government are directly responsible, of course, to the people, and their places, when vacant, will be filled in the ordinary manner of municipal elections. Mr. Carnegie will furnish some books for the library, but the city revenue of $40,000 is the one relied upon to maintain the annual growth of desirable literature.



THE CARNEGIE LIBRARY AND MUSIC-HALL AT ALLEGHENY CITY, PENNSYLVANIA.—From a Photograph by Dobbs, Pittsburgh.

to Boston to seek his fortune, and for the next two years acted as a clothing salesman. In 1856 he went into the clothing business, the firm at first being Beecher, Beard, & Co., and subsequently assuming the form of Freeland, Beard, & Co., and later Beard, Moulton, & Hoove. In 1878 Mr. Beard retired from business. Ever since he began business for himself Mr. Beard had had the management of from 200 to 600 workmen, the manufacturing department being invariably under his charge. From the beginning of his career he had taken great interest in politics, and had exercised no little influence both in primaries and in party conventions. While a resident of Boston, in 1864, Mr. Beard was placed on the Republican State Central Committee, a position he held during the years 1865 and 1866, and in 1868 he was a delegate to the Chicago Convention which nominated General Grant. In 1870 and 1871 he represented the town of Brookline in the lower branch of the Legislature. It was at that time that he began the agitation against the imperfect corporation laws, which resulted in the enactment of the present laws in their greatly improved form. In the latter year he began the long fight against the double taxation of mortgaged real estate, which was continued vigorously for ten years, when his efforts were successful. In 1875 Mr. Beard was again chosen a member of the Republican State Central Committee, acting as chairman for that year. On the 26th of February, 1878, he was appointed Collector for the Port of Boston, and upon his confirmation by the Senate succeeded Hon. William A. Simmons. During Mr. Beard's term as Collector there was an increase of twenty per cent. in the receipts over those of his predecessor in office, while there was at the same time a large decrease in the expenses. Mr. Beard served as Collector until 1882, when he was succeeded by Colonel Roland Worthington, the proprietor of the Boston *Traveller*. In 1884 and 1885 he was a member of the Massachusetts Legislature, and was the chairman of the Committee on Taxation in 1884, and was also a member of the Committee on Finance, to the chairmanship of which he was advanced during the following session. He was again a member of the Republican State Central Committee in 1883, 1884, and 1885, and for the second time was elected chairman in 1885. During the latter year he was unanimously nominated and elected Treasurer of the Commonwealth, a position he held during the years 1886, 1887, and 1888. He was a Delegate at Large to the National Republican Convention in 1888. A fine specimen of physical manhood, Mr. Beard stands six feet and two inches high, weighs 220 pounds, enjoys excellent health, and has a constitution of iron, but the wear and tear of an unusually active life have left a silver tinge in his hair and a stoop in his shoulders. His close-cropped hair and iron-gray mustache give him a somewhat stern look, but personally he is one of the most genial and approachable of men.

The office is one of the highest under the Federal government in the State, and on all great occasions the Collector is called upon to respond for the President of the United States. From the days of Sir Harry Frankland—the impetuous young Englishman who collected customs "when George the Third was King," and improved the intervals in making love to Agnes Surriage, the barefooted Marblehead girl, whom he afterward educated and finally married because she saved his life at Lisbon—to the present time the place has been filled with men of mark. Under the Continental government the Collector was General Benjamin Lincoln, who had served under Washington with distinction, and was rewarded with this place when peace was declared. A Vice-President of the United States—Hon. Hannibal Hamlin—John Z. Goodrich, Hon. Thomas Russell, David Henshaw, Hon. George Bancroft (the historian), Hon. Robert Rantoul, Hon. Marcus Morton, Arthur W. Austin, General James S. Whitney (father of ex-Secretary Whitney, of the Cleveland administration), General Darius N. Couch (who served with distinction in the war), and the retiring Collector, Hon. Leverett Saltonstall, a direct descendant of Governor Saltonstall, have each performed its duties with eminent fitness.

WHAT IS ASPHALT?

Asphalt, or more properly asphaltum, since the former word is applied in a generic way to include all the compounds of that substance, is one of the forms of bitumen found very widely scattered over the earth's surface, and in very small percentages permeating many rocks. Its formation is, without doubt, due to natural causes, similar to those producing petroleum, natural gas, and many forms of mineral hydrocarbons. To account for it, several theories have been proposed. By some it has been maintained that it originated in the rocks where it is found, by others that it is a distillate from vegetable or animal remains, and again that it is the result of purely inorganic chemical reactions. It is difficult to believe, in view of the general distribution of bitumen, and its occurrence in rocks of all ages and geological formations in such immense quantities, that it is possible to attribute its origin to either of the first two theories, no matter how plausible they may seem as applied to particular localities; nor is there, from a chemical point of view, any necessity for supposing the bitumens to be of the same origin as coal merely because they consist of carbon and hydrogen.

The chemical theory of their inorganic origin has been advanced by many investigators, but that which Mendeleff proposed in 1877, founded upon his extended experience in the Russian oil-fields, seems more generally acceptable and probable. The deposits of oil and bitumen occur along or in the neighborhood of lines of geographical upheaval or mountain ranges, as, for example, in Pennsylvania and in Russia. The dislocation of the strata during the disturbances connected with the upheavals must have caused fissures and cavities between the strata which naturally would be larger at greater depths, where the angular displacement was more obtuse and therefore wider. In these cavities the bituminous products would be formed and accumulate. They would originate (in the way to be presently described) in the lower ones, where the temperature was great, and then be forced to higher levels, into the porous overlying strata, or into sands themselves. In some cases they eventually reach the surface, but usually require the aid of borings for the plentiful escape of the products.

Of the interior of the earth's crust we are led to believe, from its great density, that it must be composed to a large degree of matter in the metallic form; and reasoning from the analogy of meteorites, it seems very probable that it consists largely of metallic iron; and from more extended geological and physical reasoning it is to be inferred that the iron and other metals are, most probably in the form of carbides, containing (like cast-iron and steel) considerable proportions of carbon, free and combined. Water penetrating into the fissures which have been mentioned, where these carbides exist at a high temperature, would be converted into steam, and reacting in the usual way with carbon, would produce hydrogen or hydrocarbons, varying in character with the temperature, pressure, length of action and other conditions which might exist. These then would from their own pressure eventually reach the surface or higher levels. Hydrocarbons have been prepared in this way in the laboratory by Cloez, and if this theory be correct, there is no reason why their formation should not continue in the earth's crust for ages to come, so that the supply of gas, oil, and bitumen may be continually renewed.

Under certain of the above conditions, gas would be formed; under others, oil; and again, asphalt. With the asphalts and their origin we are alone concerned. Whether they are the result of simpler processes or of complicated ones cannot be determined; but it is more than probable that they originate from the modification of some originally simpler bituminous substances, either by condensation or polymerization, by evaporation, or by oxidation. The last process is certainly a minor element in any change, since oxygen is not probably available in the lower strata, and most asphalts with which we are acquainted contain comparatively small amounts of oxygen. Polymerization, or the condensation of two or more molecules of a substance into one—a change well known in the laboratory in hydrocarbon compounds—is probably the most effective agent in the production of asphalt. In fact, some petroleums can be converted, artificially, to asphalt by the aid of heat. Evaporation alone can be the cause of but little change, although it may be the means of separating asphalt products from others; as for oxidation, it is natural to suppose that it must influence such material destructively, and not productively, as the oxidation products of soft asphalts are brittle and non-adhesive.

The gradations of the processes of formation, whatever they may be, are such as to produce asphalts, varying all the way from "maltha," or soft mineral tar, to "glance-pitch," which is as brittle as glass; while other varying conditions produce minerals more like the soft coals, which are not true asphalt. The asphalts are found in the free state mixed with earthy matter, and impregnating siliceous and calcareous rocks, scattered very widely over the world. In Kentucky, Alabama, Georgia, Central America, Venezuela, California, and in many parts of Europe are found springs of maltha, or mineral tar, of viscous consistency, and closely resembling gas-tar, in which the bitumen is quite free from admixture of foreign matter. The same peculiarity is also noticeable in the solid, glassy, and brittle glance-pitch of Texas, Mexico, Cuba, and other localities. Mixed with a large amount of siliceous earthy matter derived from the bed through which it rises to the surface, it occurs in the celebrated pitch lake of Trinidad, in the West Indies. It is also widely found impregnating loose sandstones in West Virginia, Kentucky, Alabama, and California. In France, Germany, Sicily, and Switzerland it is found forming bituminous limestones, and these deposits, together with the pitch lakes in Trinidad, furnish the great commercial supplies of the world.

Asphaltum, excluding the viscous bitumen or maltha, which is more properly classed separately, is an amorphous, lustrous solid, of bituminous odor, melting or softening at the temperature of boiling water, burning with a smoky flame, readily soluble in carbon bisulphide, largely soluble in turpentine, and somewhat in ether or alcohol. It is a complicated mixture of hydrocarbons, of whose constitution little is known. On distillation a rank, light yellow oil is obtained, boiling below 510° F., and a residuum is left which cannot be further volatilized without destructive distillation, the products then being rank and heavy oils, with some crystals like paraffine. Distillation with a current of steam removes the light oils more readily. Boussingault found the pale light oil, which he called petroline, to have a specific gravity of 0.89, and a composition corresponding to $C_{20}H_{32}$. The residue, called asphaltine, contained a small proportion of oxygen. The softer asphalts contain more of the oily petroline, and the harder the reverse. Analysis of the portion of the Trinidad asphalt which is soluble in ether shows that it contains carbon 85.87 per cent., hydrogen 11.06, sulphur 2.48 undetermined, nitrogen and oxygen 0.56 per cent. Beyond this we know but little of the chemistry of asphalt, all other results being unreliable, and any investigation surrounded with considerable difficulties.

On this side of the ocean the chief source of supply of asphalt is the pitch lake of Trinidad. In Europe the bituminous limestones of France, Germany, Sicily, and Switzerland furnish the chief material for paving purposes. At Seyssel, in the Department of the Ain, France, at Ragusa, Sicily, at Limmer, near Hanover, Germany, at Vorwohle, in the Duchy of Brunswick, Germany, and in Val de Travers, Canton Neufchâtel, Switzerland, limestones are found impregnated quite uniformly with from 9 to 11 per cent. of bitumen. These are mined on a large scale, and after preparation, or heating alone, are used for roadways and sidewalks. The limestone is of fine hard grain, but not crystalline, that of Seyssel being harder and containing somewhat less bitumen. From these rocks two classes of pavement are made, one by the "hot compression" process, the other by the "mastic" process. The compressed asphalt is used for roadways, the mastic for sidewalks, floors, etc. In the first the rock is reduced to a fine powder by disintegrators and rolls, and then heated in cylinders with revolving blades or paddles, in a current of hot air, until softened and freed from the more volatile oils. It is then hauled to the street in carts. It loses its heat very slowly. There it is spread, and evenly raked, tamped, and rammed until compact and resonant. As soon as cool it is ready to bear traffic.

In the mastic process the original crushed rock is heated in kettles containing a certain amount of melted refined bitumen or asphalt, now generally the Trinidad variety, the amount varying according to the richness of the rock. With the addition of this asphalt the rock melts, without it it will not melt. It is then thoroughly mixed, and cooked for several hours below 300°, and then run into moulds. This preparation, in the form of blocks, containing about 15 per cent. of asphalt, is then again manipulated on the streets. Alone it will not melt, so that another proportion of refined asphalt (Trinidad), softened with oil of some description (in this country, heavy oil of gastar; abroad, shale oil), is added to the broken cakes. After complete softening, under continued stirring in the heating kettle, sand and coarse grit are added, and after being thoroughly mixed, the material is taken and poured upon the prepared surface from buckets, to the thickness of from one inch to one-half inch, and spread like plaster with wooden smoothing tools, smoothed, then dusted over with clean sand, and while cooling rubbed down to a fine surface with slabs of stone and sand. The proportions in the mixture are about as follows: Broken prepared mastic, 60 per cent.; Trinidad asphalt cement, 4 per cent.; sand and grit, 36 per cent. This form of surface is preferred for walks, the hot compressed form for roadways. Mastic is distinguished by its greater elasticity, owing to the high proportion of asphalt it contains, which makes it suitable for use in floors and roofs, which must be water-tight and free from cracks, and in places where there is much expansion and contraction. Good examples of its use may be seen in City Hall Square, New York, and in the floors of the United States Bureau of Engraving and Printing, Washington.

The Sicilian rock asphalt has been used considerably for the last four years in Rochester, New York, and St. Augustine, Florida. Its introduction on Madison Avenue, New York, during the present year is being undertaken. Nearly all the asphalt surface in existence, amounting, according to Captain Green, to over 5,500,000 square yards, is composed of compressed concrete of Trinidad asphalt, cement, and sand. The source of this asphalt is the pitch lake in the island of Trinidad. This is a flat expanse of over one hundred acres of rough brownish bitumen, of an earthy look, very much cracked, and honey-combed with, here and there, pools of water and patches of soil upon its surface. In the centre is a soft spot which will not bear a man's weight, though over the remainder carts can be driven, so that it can hardly properly be called a lake. From borings, which were at one time made to reach oil, it appears to be about 18 feet deep. Beneath there is a bed of sandy clay, through which the asphalt seems to rise, contaminating itself in this way with the mineral matter. The deposits must contain, in all, several million tons of crude asphalt. It is about three miles from the sea, and a hundred feet above the sea-level. It is excavated with picks, hauled to the shore, carried through the surf by laborers to lighters, and loaded on vessels, which bring it to this country. It possesses the properties of viscosity to a sufficient degree to flow together in a solid mass in the hold of the vessel, from which it is again removed by picks in discharging the cargo. The character of the material from different parts of the lake, and from the old deposits between the lake and the shore, is very different, the older deposits being much harder and drier, containing less of the oily constituents, and at times showing portions resembling coke.

The asphalt as unloaded from the vessel is a dull brownish black, earthy-looking substance, containing much water and some earth and vegetable remains. It is heated in large tanks for several days, with the result of driving off the water and bringing it to a liquid condition, the temperature reaching between 300° and 400° Fahr. Much of the earthy matter settles, and the organic or vegetable remains rise to the top and are skimmed off. It can then be drawn off as refined asphalt.

The water in going off carries with it several other volatile ingredients. If condensed there will be found floating on it a light yellow oil, the petroline previously referred to, which is easily volatile in steam. It is very rank and sulphurous, and it is a question whether it is of any value. In some cases it is returned to the melted asphalt. The water also will be found to be of strongly acid reaction, and to contain a considerable amount of matter in solution. As yet the nature of this matter has not been made out, but it is probably connected in some way with the chemical processes involved in the original production of the bitumen. At the lake considerable quantities of hydrogen sulphide gas are evolved at the soft spot, and the water in the bitumen becomes impregnated at the same time with the crystalline salts and acid found in it on refining. Refined asphalt has a dull fracture, darker than the crude asphalt, and a homogeneous appearance. It is very brittle at ordinary temperature, and possesses little cementitious value. To give it the necessary tenacity it is mixed, while at a temperature of about 325° Fahr., with from seventeen to twenty pounds per hundred of the residuum from the distillation of petroleum, a thick heavy paraffine oil, varying considerably in composition, according to the source of the petroleum and method of distillation. Thorough agitation is very necessary to produce an even product, which in summer, on cooling, can be easily indented with the finger, and on slight warming, drawn out into strings, and showing great tenacity. This is the asphalt cement of the paving industry. It must be prepared with great care, and it requires considerable experience to obtain a regular product of the proper consistency. A mistake in this regard is fatal to the life of the surface. It is a good cementing material, and has only the disadvantage of the presence of the foreign organic matter not of a bituminous nature, which is undesirable, for reasons which need not be considered here. The fine mineral matter is scarcely a disadvantage, since it would necessarily be added in the preparation of the surface mixture. It is, in fact, generally supplemented by a proportion of fine powder of limestone, for the purpose of filling the voids in the sand. It consists very largely of fine siliceous sand and some clay. An analysis of the mineral residue from an asphalt cement shows:

Sand insoluble in acids	82.08 per cent.	
Containing silica		15.16 per cent.
Iron, alumina, and lime	12.27 per cent.	
	100.00	

The non-bituminous residue, from the last drawn portion of a tank of cement, which was coarser than the above material, consisted of:

		Per Cent.
Organic matter		7.50
Silica and silicates insoluble in acid		57.67
Containing silica	81.04	
Alumina and trace of iron	7.53	
Alumina		2.90
Iron		1.17
Lime		.50
		99.94

Asphaltic cement of this description contains from 65 to 70 per cent. of bitumen, and is mixed with the following materials for the production of the paving surface:

Clean sharp sand	65 to 58	per cent.
Crushed stone dust	28 to 23	"
Powder of limestone	0 to 8	"
Asphalt cement	12 to 18	"

The details of the operation are as follows: The mixture of sand and stone-dust is heated in rotary drums to a temperature of not less than 250° Fahr. nor more than 325°. A portion of this is measured out in a box of known contents, together with the proper amount of cold powdered limestone. It is then dumped into a double-bladed mixer revolving from 45 to 60 times per minute, and the required weight of melted asphalt cement at a temperature of about 300° added. Mixing for about a minute or two produces a homogeneous mass, which is dropped into carts and hauled to where it is to be used. There it is spread upon the foundation to the requisite depth, and rolled with heavy hand-rollers of iron oiled with petroleum. After this preliminary compression hydraulic cement is scattered upon the surface, and the final work of compressing it is done by continued cross-rolling with heavy stone and steam rollers until the mixture is cold. The surface is then ready to be thrown open to traffic.

Refined asphalt is used for various purposes other than that of paving cement; as, for example, in engineering works like an ordinary cement, as a water-proofing material, and for roofing purposes, and as a paint or varnish. Varnish is made by dissolving the asphalt in oil of turpentine, with the addition of alcohol and other minor ingredients. Paper-felt is saturated with it for roofing purposes, and some patent insulators contain it as a constituent. In masonry it is used with great advantage where the walls must be water-tight, as in the arches of aqueducts or tunnels, and also where rigidity is undesirable, as in the concrete foundations for machinery to prevent vibration in the neighborhood due to high speed or shocks.

THE NEW LINCOLN CLUB HOUSE, OF BROOKLYN.

Among the most prosperous of the purely social clubs of Brooklyn, now so numerous, is the Lincoln Club, which has just celebrated Lincoln's birthday, February 12th, by formally opening its new club-house, at 65 and 67 Putnam Avenue, with a ladies' reception. This club, which was at first formed for political purposes, soon after its incorporation entirely dropped its political features and became a purely social organization, a change which speedily resulted in increased membership. Everything about the new edifice, which is the work of Architect R. L. Daus, of Brooklyn, is solid, substantial, and comfortable. It is four stories high, with a frontage of forty-five feet by fifty feet deep, and with a two-storied extension in rear of equal depth, on the top story of which there is a splendidly lit and ventilated billiard-room, which has not its equal in size in any club-house in New York or Brooklyn.

The style of the building is that of the early French Renaissance, the material consisting of a tasteful blending of pressed brick, Lake Superior brown-stone, and terra-cotta, the whole embel-

.Y PROSPEROUS?

l Street has been directed e financial condition of a of our population. The has been importuning the ads traversing that State r carrying corn. Finally, of other State officials, lu lroad companies to make an "emergency rate" on ction that has been conceded is not a large one, being a cent and a half a bushel, or about ten per cent. upon the previous tariff. The basis of the appeals for this reduction is the abject poverty of the farmers, and their inability to market their corn, even at the exceedingly low yet nominal prices quoted along the lines of the railroads. The idea in making the reduction is that the slight difference in price will take Nebraska corn to market in preference to that from other localities, and thus enable the farmer to get a little money, though only a partial return for his labor in raising it. The success of the effort has stimulated the State authorities of Kansas to make a similar one in behalf of the farmers of that State. This sort of relief can at best be only temporary, for the market at Chicago and other centres of shipment will very soon reflect the stimulated movement.

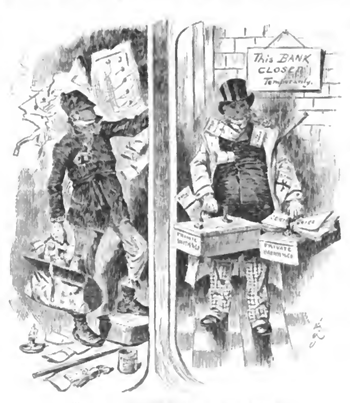
It should be noted that the railroads were not averse to making this reduction, but were reluctant to do it, because under the Inter-State Commerce Law, they believed they would have to revise nearly their entire tariff in order to make it conform to it. They would, at least in the ordinary course of business, have to lower the rates on all kinds of freight graded approximately as low as corn. They were also afraid that the rates they might make solely for the purpose of mitigating the hardships of the farmers might be used against them by State Railroad Commissioners to force the establishment of those rates permanently. The railroads recognized the desirability of some sacrifice on their part, and have doubtless made it upon an understanding with the State authorities that is indicated in the term "emergency rate."

Wall Street has been well advised of this movement, and it has raised there, as it possibly has throughout the country, skepticism of the current reports of general prosperity. It has been fashionable ever since last year's crops were assured to refer to their magnitude as an unanswerable argument in favor of an improvement in general business and more profitable railroad traffic. It appears now that the luckiest farmers were those who were the quickest to market their wheat and corn, for the enormous yields of both have been a constant weight upon prices. As an agricultural nation we have to face a condition of excessive production, and it is a condition that affects not only the poverty-stricken farmers of Kansas and Nebraska, but is felt seriously through all of the richer agricultural sections farther east. It is a condition that may have its uses, since it may force upon the farmers perception of the fact that the price of their cereals, which is their principal product, is determined by the price of the surplus of each crop, and that surplus is marketed in Liverpool in free competition with the surplus of all other grain-producing countries. So far as grain is concerned, it is a free-trade market. After an appreciation of that fact has obtained, an important factor in the prices of most of the staple articles that the farmer buys or needs to buy, namely, the tariff, may be estimated by him for what it is really worth. This phase of the matter is beginning to receive serious attention at the financial centre of the country, since it is still held there that the fullest prosperity of the country must spring from its agricultural development. If the millions who depend upon tilling the soil for support do not get an adequate return for their labor, their ability to buy is curtailed, and trade with them is correspondingly reduced.

The fact that the earnings of the railroads all over the country continue to show increases, as compared with last year, suggests the inquiry whether business, as a whole, is as largely dependent upon the agricultural community as heretofore. The condition described and the figures referred to, taken together, rather encourage one to take the negative of such a proposition. The acquisition of wealth in mercantile and other pursuits than farming, and the rapid growth of manufacturing industries, are unquestionably changing the character of our population, so that it may be, as in the older countries of Europe, that prosperity upon a certain level will conceal increasing poverty below it, and thus give an appearance—superficial, to be sure—of general welfare. Wall Street is not an over-thoughtful community, but questions like those that have been touched upon are forcing themselves upon it. The community that lives in and about the Stock Exchange is depressed because its business is nothing like what it used to be, and the times contain no signs of a revival of it. And there is a searching for the causes that have produced the present apathy of the public toward the stock market, and which appear to be still operating. The experiences of the last few months in the money market, though by no means new, appear to have impressed upon Wall Street the necessity for a modification of our financial system or methods. It has begun to view the constant accumulation of money in the Treasury with repugnance, and is therefore likely to regard the next national campaign not as an educational movement, but as an occasion for earnest work. If the people who are engaged in the unprofitable business of raising grain, which they are forced to sell in a free-trade market, while they supply their own wants in a protected market, could be brought to see the Treasury surplus and the manner in which it is accumulated in the same light that Wall Street now quite universally regards it, a bond of interest between the two would soon become apparent. The most important interest of both is at stake in this matter, and it is identical with that of the entire country.

Collis Armstrong.

New York, *Saturday, February 8, 1890.*



THE OLD AND NEW STYLE OF BANK ROBBERY.

INFERNAL INGENUITY

Could scarcely devise more excruciating tortures than those of which you see the evidences in the face of a rheumatic or neuralgic sufferer. The agonies are the consequence of not checking a rheumatic or neuralgic attack at the outset. Hostetter's Stomach Bitters has been found by skilful medical practitioners to possess not only remedial, but defensive efficacy, where those diseases exist, or a tendency to them is exhibited. Surely this pleasant but safe botanic medicine, bearing, too, such high specific sanction, is better than the poisons often employed, but most unsafe, not only in continuance, but in isolated doses. The blood is depurated thoroughly from the rheumatic virus, and the nerves, slightly impinged upon, saved from ailments and direful throes by this benign, saving medicine, which likewise exhibits marked efficacy for malaria, kidney complaints, dyspepsia, constipation, and liver complaint.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

DESERVING CONFIDENCE.

There is no article which so richly deserves the entire confidence of the community as Brown's Bronchial Troches. Those suffering from Asthmatic and Bronchial Diseases, Cough, and Sore Throat should try them. They are universally considered superior to all other articles used for similar purposes.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA, "THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Dyspeptics, Nicholson's Liquid Bread will relieve your trouble. It is the great aid to digestion. Easily assimilates with the food, and gives strength to the digestive organs. Your druggist and grocer have it.—[*Adv.*]

CORNELL'S BENZOIN COSMETIC SOAP
For the complexion and skin. 25 cents.—[*Adv.*]

Blair's Pills.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[*Adv.*]

All danger of drinking impure water is avoided by adding 20 drops of Angostura Bitters.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

The world-wide reputation of Ayer's Sarsaparilla is the natural result of its surpassing value as a blood medicine. Nothing, in the whole pharmacopœia, effects more astonishing results, in scrofula, rheumatism, general debility, and all forms of blood disease, than this remedy.—[*Adv.*]

THE RULES.

THERE ought to be no serious dispute about proper rules of procedure in Congress, because, however strong party spirit may be, every member is aware that such rules should secure the right of the majority to act, after full and fair debate. The rules certainly ought not to enable the minority, after full and fair debate, to prevent the majority from acting. But it must never be forgotten that a majority, like a king, tends to tyranny, and that the rules should equally secure the rights of minorities. Majorities can take care of themselves, while bills of rights and constitutions are designed to take care of minorities by restraining and regulating the power of majorities. Twenty years ago LABOULAYE said that France was not ready for a republic, because Frenchmen could

eral RAWLEY against the propo...

be a wanton and arbitrary exercise of the power of the party majority, which rules of procedure are intended to restrain, if the rule should be adopted. There is no measure which the party majority in the House approves which it cannot adopt if it chooses to appear. Rules which it may adopt to prevent a wholly unreasonable obstruction of the action of a majority, present and ready to act after fair and full debate, will be sustained, we believe, by the intelligent opinion of the country. But this is not such a rule. It is a blow at the just rights of the minority, which the majority, in the interest of honest government, ought to protect and secure.

IMPERIALISM AND SOCIALISM.

THE late "rescripts" of the Emperor of Germany are as significant as they are extraordinary. He proposes a conference of England, France, Belgium, and Switzerland, and possibly other powers, to agree upon some scheme of securing regular and remunerative employment to working men, limiting the hours of labor, and adjusting the rate of wages. This is an imperial revival of LOUIS BLANC's plan of national workshops in France forty years ago—a plan which was then felt to be Quixotic, and which ended in disaster. The question of state socialism has made great progress since that time, however, and Germany has gone farther than most states in its practical recognition. But the present imperial step is very much longer than the most democratic state has contemplated. The Emperor declares it to be the duty of the state to regulate labor so as to insure the health, morality, and economic wants of working men.

That is a plain declaration of the duty of a state to support its citizens. Working men is an arbitrary term, which in this case must be construed to mean the great mass of the German people, because the multitude everywhere earns its livelihood by working for wages. It is not surprising that this announcement of the Emperor is interpreted in various ways. It is supposed on one side to be a serious proposition; on another, to be an ingenious device to expose the utter futility of any such scheme; on another, to be "a good enough MORGAN till after elec-

to keep the place within the ...

tion. The office has been administered without regard to politics, and strictly upon the reformed system, which the Republican platform declared ought to be extended, while the Republican President said that only the interests of the public service should suggest removals from office.

Mr. SALTONSTALL's term expires in May, but in defiance of the party platform and of his own pledges, and in deference to the urgency of Senators HOAR, DAWES, and other politicians, the President has removed him. Mr. HOAR, who sharply censured President CLEVELAND for such performances, naturally hastens to say that the removal has nothing to do with a just view of reform, which is certainly true, and that the office is political. It is political, however, solely because it has been treated as the Senator and the President now treat it, as spoils. A Massachusetts Secretary of the Treasury once said that by a party change of administration the people meant to change the messenger at his door. He held a messenger to be a political officer. The implication that Collector SALTONSTALL, or any other honorable officer, would have allowed his views of a tariff to influence the discharge of his duty under the law is simply absurd.

President HARRISON asked his Secretary of the Treasury to try to obtain Mr. SALTONSTALL's resignation. Mr. SALTONSTALL replied with perfect courtesy that, placing entire confidence in the declaration of the President concerning tenure of office, he was prepared to serve out his term unless removed by the President for such cause as he had announced to be controlling in such cases, and the Collector respectfully asked to be informed if such cause existed. He enclosed a copy of the letter to the President, and the President forthwith removed him. President HARRISON came in upon the strongest declaration of reform in the civil service that any party ever made. He said that he should promote reform, and hoped to extend it. There were not in the whole service three more conspicuous illustrations of upright, non-partisan, capable, and efficient public officers than Postmaster PEARSON, Collector SALTONSTALL, and Naval Officer BURT. They were precisely the kind of offi-

taken out of the enterprise by making it a World's International Fair of the Republican party. The great work for which I am ardently anxious will then be a Fair for Republican revenue, with the incidental election of a Republican President."

This is a view which would undoubtedly have caused the late Mr. Squeers to exclaim, "Here's richness!" But it has its serious side also. Not many months ago, just after the election of Mr. Harrison, the *bien aimé* of happy Republicanism, the comic papers presented us weekly with exhilarating pictures of the "Big Four," representing the non-partisan Mr. Platt and Mr. Warner Miller and Mr. Depew and Mr. Hiscock, dancing merry dances—gavottes, perhaps, and boleros and joyous hornpipes and other saltatory exercises expressive of harmonious happiness. Then the beautiful vision of a World's Fair arose above the horizon of 1892 like the summer morn. The cup seemed almost too full. The bill which was to secure the prize was made ready, and the suave Democratic leader in the Republican Assembly moved its immediate passage, when one of the Four suddenly called a halt. The summons recalled the direction in old plays, "Alarum: enter an army." Wild confusion ensued. At last, in the meeting of the General Committee, Mr. Warner Miller said that he would not serve upon the Fair Commission if it should be made political. Mr. Miller and Mr. Depew both voted for the adoption of the report which scouted and flouted the non-partisan Mr. Platt; and simultaneously Mr. Hiscock telegraphed from Washington substantially, "The Platt bill, or no Fair."

In such woful disaster that hilarious dancing ends! As the grieving pen writes these lines there really seems to be danger that we shall be laughed at. We are on the perilous edge of being ridiculous. The enthusiasm of last summer, the great assembly of distinguished citizens at the City Hall, the appointment of eminent committees, the daily jeers at Chicago, the munificent subscriptions, the solemn hearing in Washington, the proud assumption that Paris and the Eiffel Tower were to be easily outdone—all these ending in the apparent demonstration that we cannot manage a worthy commemoration of the discovery of the continent and the marvellous development and progress of America because of party intrigue and jealousy! If, as is now plainly alleged, Chicago has never wanted the Fair, and has been playing merely a game of bluff, and New York has ruined it in advance by trying to impose upon it a party character, we cannot complain, however we may chafe, if a ripple of inextinguishable laughter runs around the globe.

McCARTHY'S "FOUR GEORGES."

The second volume of Justin McCarthy's *History of the Four Georges* has just been issued by the Harpers. It is a very entertaining popular summary of the chief events of the reign of George the Second, with vivid sketches of its famous persons. The chief figure is of course Sir Robert Walpole, and it is interesting to observe that, with less apparent sympathy with him than Mr. Morley shows in his recent work, Mr. McCarthy makes the same general estimate of the statesman, reckoning him, with his great ability and invaluable service to England, only just short of a great man.

Mr. Morley justly holds Walpole to have been a true patriot, and is not content to explain his conduct, even when he condemns it, as the result of mere love of office. It is curious, however, that while Walpole's control for twenty years is generally conceded to have established securely the results of the revolution of 1688 and the Hanoverian succession, Mr. McCarthy is of opinion that the rising of Prince Charlie in the year after Walpole's death would probably have succeeded, for the time at least, had he only pushed on to London. George the Second was ready to go, and would have gone without the regret of England. Morley also states that Walpole apprehended that the Pretender might perhaps have returned if he would have favored the English Church and have abjured vindictive retaliation.

Mr. McCarthy has the art of interesting narration and skilful avoidance. His task is to make a picture of the times by a selection of its characteristic points and characters, and he has performed it with the same success as in his *History of Our Own Times*. When he has completed his sketches of the Third and Fourth Georges he will have finished a compact and popular history of England under Hanoverian rule, written with democratic sympathies and with the kindliest feeling. The story will have been told with accurate knowledge and in a most entertaining manner.

AN ANNUAL PROD.

The Hospital Book and Newspaper Society, which furnishes reading to the sick and suffering, makes its sixteenth annual appeal. The appeal is not a sign of declining public interest in the work, for the distributions of the society during the year were, we believe, larger than ever before. If the impatient reader should therefore inquire: "Why, then, prod us again? If the thing is doing so well, why not let it do well, and spare us one, at least, of the incessant appeals?" the answer is very simple. The impatient reader fills his life with such constant well-doing that if he is not specifically prodded, any one of the opportunities which it is his wish to improve is sure to drop from his memory.

This is the precise case with this noiseless and admirable charity, which asks of all patient and impatient friends but two simple things: one is to drop magazines and weekly, illustrated, and daily papers in the boxes conveniently provided at the railway and ferry stations and elsewhere, and to send other reading matter to 20 University Place; and the other is to send little sums of money to the treasurer, Mrs. Fordham Morris, 20 Fifth Avenue, for the necessary expenses of the good work.

Nothing could be simpler or more practicable. This busy and pleasure-diffusing society offers everybody the happiness of eating his cake and having it. It invites us all to do good at no cost to ourselves—a most unworthy motive, indeed, and one which is not consciously proffered by the Society. But it is none the less true that we are asked to make over the paper or magazine from which we have already taken our two cents' or ten cents' or twenty-five cents' worth of enjoyment, and so balanced our books, to others, who will derive from it similar if not greater pleasure. There is no annual prodding which a newspaper can perform with greater satisfaction than that which spurs the fruitful recollection of this excellent charity.

THE NEW MINISTER TO RUSSIA.

In securing the nomination of Mr. Blaine at Chicago in 1884, no three friends of his were more efficient than Mr. Whitelaw Reid, Mr. William Walter Phelps, and Mr. Charles Emory Smith. It is not surprising, therefore, that these gentlemen have all been called to distinguished posts under the present administration. Mr. Reid's appointment to the French mission and Mr Phelps's to Germany is now followed by that of Mr. Smith to Russia. Like Mr. Reid, he is a journalist of ability, distinction, and long experience. If his party zeal seems sometimes to make him unjust to his own true and generous impulses, it is plain that it cannot extinguish them, and that his heart and judgment support most willingly the best aims and professions of his party. Personally a cultivated, courteous, honorable, and genial man, he is admirably qualified to represent America. But his withdrawal from his present chair will be a serious loss to the Republican party. Perhaps, however, in the next campaign his opponents may find that it is but *reculer pour mieux sauter*.

COMIC OPERA ROYALTY.

The small excitement which was produced by the opera bouffe performance of the young Duke of Orleans in Paris is significant of the firmer foundation of the French Republic. There is always, of course, a doubt what effect such an incident may have upon so volatile a multitude as the inhabitants of Paris, but it is pretty evident that the danger of a serious royalist rising in France is very greatly diminished. The law prohibiting the return of certain persons to the country has been enforced in this instance by a trial and sentence of two years' imprisonment.

The old romantic legitimate sentiment which was represented by the Count of Chambord could not be transferred to the Count of Paris. He might be acknowledged perfunctorily as the heir of the monarchy, but not with any rapture of royalty; while the Orleanist régime itself could make an effective appeal only by demonstrating its greater practical expediency for the country—a task which it would hardly undertake. It is much more than a generation since Louis Philippe suddenly left the Tuileries, and it cannot be said, with all the good sense in many ways of the Citizen King, that he left any family prestige behind him. He was himself a compromise between the monarchy and the republic, and the republic has outgrown the necessity of such further compromise.

The young man of the present movement would offer France either the monarchy of Charles Tenth or of Louis Philippe. But the former is impossible, and the latter is unnecessary. His only reliance, therefore, would be a possible restless dissatisfaction in the country with the existing order, which would accept his leadership not from preference of a monarchy, but from a desire of change. To control successfully such a movement under such circumstances would have baffled Napoleon himself. Louis Philippe would never have tried it. What qualities for the enterprise his great-grandson may have, he will hardly have an opportunity to demonstrate.

HONOR TO WHOM HONOR.

In a recent article upon Dom Pedro's patriotism we credited inadvertently the report of his remarks to the Associated Press, instead of the Press News Association, to whose enterprise and energy the interesting interview with the ex-Emperor was due.

SAVING THE FORESTS.

The Governor's suggestion of an Adirondack Park has been followed by the revival of the State Forestry Association, under the presidency of Mr. Morris K. Jesup, and the association with him as officers of many conspicuous citizens. The sanitary aspect of the subject, also, has been presented by a committee of physicians. The elevation of the Adirondack forest, its equable temperature, and the hygienic qualities of its evergreen timber make it an incomparable health resort, especially valuable in incipient stages of consumption.

The destruction of lumber for charcoal by the iron interest is a very serious blow at the forests, and the great benefits of the region will be lost if there is general public indifference. The committee of physicians propose that the whole region be acquired as a park, either by an immediate appropriation or by annual grants, and that the destructive extension of railroads into the forests be prohibited. Judicious planting and cutting will make the timber supply of great advantage to the State, and Mr. Clinton L. Merriam, who is thoroughly familiar with the subject, says that many of the lumber owners now admit that the destruction of young trees is greatly injurious to their own interests.

At the present time the Adirondack forests are threatened by four railroads—one from each point of the compass. The danger from them to the whole community in the destruction of the woods is greater than the advantage to be gained by any number of private companies. New York has proved by the Niagara reservation that if properly aroused it has quite public spirit enough for such great enterprises. In that case, however, there was a system of organized and persistent appeal and diffusion of information and wise assiduity in pressing legislation. The movement also had the invaluable assistance of two or three members of the Legislature who were personally deeply interested in its success. All these the association means to provide. The Adirondacks should not want personal friends in the New York Legislature, supported, as they would be, by the most intelligent sentiment of the State.

PERSONAL.

Major Serpa Pinto, whose impetuous and unauthorized methods of territorial aggrandizement in Africa gave England a plausible excuse for bullying Portugal, has always been more or less of a source of anxiety to his country. He is forty-four years old, and entered the army while still a youth. Having distinguished himself in war and exploration—his principal feat being his journey across Africa, from Benguela on the west coast to Durban on the east—he was welcomed back to Portugal with marked distinction, and received honors from many of the governments and learned societies of Europe. His restless and roaming disposition would not permit him to remain at home, however, although he had been elected to the Chamber of Deputies, so he was appointed Consul-General at Zanzibar, where he soon became embroiled with the English and German authorities, and finally declared unwarranted war against the Sultan. Then he was given a roving commission to develop and extend the Portuguese settlements on the Zambesi, an expansion of power which succeeding events have apparently proved to have been unwise. Now the Major is in apparent disgrace with his home government, although his rashness has endeared him to the radical hot heads, by whom he is already hailed as the "first President of the Portuguese Republic." Serpa Pinto is small in stature, but lithe and muscular. He wears his hair and beard long, his dress is foppish, and he has the yellow complexion of a tropical explorer. He is a thorough man of the world, and an eloquent speaker.

—Reminiscences of George P. Morris and N. P. Willis are always interesting, and no one is better fitted to write entertainingly of them than Morris Phillips, the present editor of the *Home Journal*. In recently changing the form of his paper from four to eight pages, Mr. Phillips publishes an illustrated article devoted to these well-known poets and *littérateurs*, who founded the paper forty-five years ago. Mr. Phillips's acquaintance with them began in 1854, when he entered the service of the *Home Journal*, and he learned their characteristics as he met them at work or in their homes. He has life-size portraits of both men, that of Morris being a pastel by Julius Gollman, a famous German artist, while Willis's was painted by Elliott, the famous American portrait-painter.

—For some years before her death Mrs. Prudence Crandall Philleo received an annuity of $400, voted her by the Connecticut Legislature in recompense for the injury done her years ago by the same body in breaking up her school for colored girls.

—A graceful and well-deserved tribute has been paid Mrs. Margaret E. Sangster by the Freshman class at Wells College in electing her an honorary member. Mrs. Sangster's popularity among the youth of both sexes is proverbial. Besides those who know her only by reputation she has many warm personal friends, not the least among these being the young ladies of the large and flourishing Bible class which meets her every Sunday afternoon in Brooklyn.

—Ex-President Cleveland has taken a pew in the Central Presbyterian Church in this city, and his wife has transferred her membership to it from a Washington church. Their pastor is Rev. Wilton Merle Smith, who was graduated from Princeton in 1877, and is now about thirty-four years old. Rev. Mr. Smith distinguished himself as a base-ball pitcher in college, and has not considered it beneath his dignity to engage in out-door sports since entering the ministry.

—Henrik Ibsen, the Norwegian dramatist and poet, has been happily married for over thirty years, but has only one child, a son, who was formerly connected with the Swedish legation at Washington. Mrs. Ibsen is the step-daughter of Magdalena Thoresen, the Norwegian poetess. The poet left his native land in 1864, and has since lived in Rome and other Italian cities.

—Evidence accumulates that Mary Anderson is engaged to Antonio de Navarro, the son of José F. de Navarro, of this city, and the fair actress is said to have written William Black, the novelist, a letter announcing the fact. Meanwhile her friends in this country are not so zealously denying the report as they were.

—Captain William John Logan, who died in Brooklyn on the 10th inst., aged sixty-eight years, was widely known as the captain of many famous clipper ships during the California gold fever. At nineteen years of age he commanded his first ship, and subsequently the *Lawrence*, *Napier*, *Winged Rover*, and *Red Rover*. Captain Logan was always accompanied on his voyages by his wife, who still survives him.

—Notwithstanding his seventy years, General Sherman is one of the best-known club and society men in New York. Evening dinners and receptions furnish him his recreation, for during the day he is kept busy by an enormous correspondence and by numerous callers. He never grudges the demands upon his time made by old soldiers, many of whom write to him or call upon him for advice.

—The death of Cardinal Pecci, the brother of the Pope, has taken from the latter a valued adviser. He was raised to the cardinalate in 1879 by his brother.

—Stepniak, the exiled Russian nihilist, lives quietly in London with his gifted wife, and the two spend much time in the British Museum, ransacking books and making many notes. Stepniak is an industrious writer, and is rarely seen at the clubs or in society, although he has a host of friends.

—Sam Wah Kee, the wealthiest and most influential Chinese resident of Boston, has obtained leave from the government to visit his native land and return to this country. The Chinese restriction law seems to be elastic enough to admit a Celestial "merchant," who is not a "laborer."

—An extraordinary career was closed by the death of Photius Fisk at Boston the other day. Over seventy-five years ago an American missionary picked up in the streets of Smyrna a little Greek boy whose parents had evidently died of the plague, and sent him to this country. He spent several years in Rev. Dr. Lyman Beecher's household, and then was educated for the ministry. In due time he became a clergyman, but the defence of slavery by the Church, and the tenets held by some of the Congregational theologians under whom he had studied, were too much for him, and he turned into a radical. He worked with Gerrit Smith and Joshua Giddings in the cause of abolition, and was finally appointed a chaplain in the navy, principally through the influence of John Quincy Adams, then in Congress.

RECENT ASPECT OF BROADWAY AT CITY HALL PARK.

STREET OBSTRUCTIONS IN NEW YORK.

An indisposition on the part of the public to assert and protect a certain class of its rights has become an acknowledged feature in American cities as compared with those of Europe, and in none perhaps is this more strongly marked than in New York. A contemplation of the patient and long-suffering crowds that morning and evening are jammed into the elevated trains and street cars of the metropolis, and who apparently accept with meekness the strap-hanging and aisle- and platform-filling situation as a permanent condition, supplies a ready illustration of the fact. Incivilities from ticket-sellers and other corporation employés whose business it is to serve the public are borne with as they would be in no other civilized country.

Especially is indifference to and disregard for the rights of the community at large manifested in the unwarranted obstruction of the streets. The abuse takes many forms. It includes the appropriation of parts of the highway to private uses, the practice of regarding it as a refuse receptacle, and the failure of the authorities to properly pave and otherwise care for it. The prevailing gas, water, sewerage, electric subway, and steam-heating systems involve a tearing up of the roadway which at best interferes greatly with traffic; but where the excavating and refilling are carried on in a slovenly and reckless way the evil is immeasurably increased. The multiplying subterranean uses to which the streets of a modern city are put call for a thorough method of treatment, whereby the present frequent and obstructing breaking up of the surface shall be avoided. Perhaps nothing less than connecting series of roomy tunnels will solve the problem. The urgency of remedying the existing state of affairs has been emphasized in a marked way by the condition of lower Broadway for several months past. Street cars between South Ferry and the Post-office have much of the time been useless to any one having business on hand. As a rule, walking has been the speedier mode of covering the distance. The pavement has been in a continual process of irruption, and a goodly share of the much-needed highway closed. But even under the barbarous plan of permitting the managers of each underground system to dig their own independent trenches, there is room for great improvement—a fact that is sufficiently demonstrated in London, where the contracting constructor of the pavement attends to its breaks and repairs under bonds, the cost being paid by the proper party.

Obstructions that are trivial elsewhere are of importance in crowded streets. A bad or rough road-bed hinders traffic materially. Over a smooth one the stream flows easily and more rapidly, and the capacity for service is increased. It is estimated that the effective draught power of horses is some forty per cent. greater on good asphalt than it is on the Belgian blocks so much used in New York. The latter, of course, are very much better than the unspeakable cobblestones that still afflict certain parts of the city. The unnecessary wear and tear of vehicles and the waste of horse-power due to the inferior pavements of the metropolis cost enough to pay in a very short time for placing the latter in a condition equal to that of the streets in London and Paris. The raised car rail in common use in one thoroughfares is an abomination that would not be tolerated on the other side of the Atlantic. In the narrow down-town streets it is responsible for a considerable share of the "jams," and the pecuniary loss that is incurred by the constantly recurring delays involved. Wagons that might otherwise pass each other in the small available space are prevented through the sliding of their wheels along the iron ridge, and long lines of them are stopped indefinitely in consequence. In all parts of the city this rail remains a perennial wrecker of wheels and axles. It is the bane of carriages and cabs and the dread and discomfort of their occupants, and all because the public permits the railroad companies to impose upon it. A partial improvement in the shape of a compromise rail is slowly being instituted, but it will be some years before even this grudgingly granted amelioration is effected. The result will fall short of being satisfactory, in view of the fact that still better rails, which offer practically no obstacle or injury to traffic, are in vogue in other great cities of the world.

The encroachments of builders upon the highways form a notable class of obstructions. The legal restrictions are very generally disregarded, except in the busiest parts of the city. The law permits the use of one-third of the street in front of the lot upon which the structure is being erected, proper provision being made for the safe passage of pedestrians on the sidewalk. The rule of the builder appears to be to take at least half the street, and the frontage of as many adjacent lots as suit his convenience. He, moreover, usually prefers to have his sand piles more or less tracked and distributed by passing wheels to properly shoring them up for his own and the general benefit. The sidewalk requisition is often ignored altogether. In the crowded business centre, where a similar contempt for the rights of the community obviously cannot be tolerated, the situation is more as it should be, and demonstrates the feasibility of bettering matters in the other districts if the authorities are so disposed. The truckman who takes the trouble to protest against a brick pile abutting on or beyond the middle of the street, or the pedestrian who complains in proper quarters of the splashings of mortar beds, is rare, and as there is an absence of official action the general imposition assumes large proportions.

The storage in the highways of trucks, carts, delivery and peddlers' wagons, when not in use, constitutes another and serious form of obstruction. It is estimated that there are no less than eighty thousand vehicles of various descriptions standing nightly in the thoroughfares of the metropolis, and a large percentage of them throughout the day also. The plea for this occupation of public property for private uses is that the owners or users of the wagons cannot well afford to otherwise care for them. The law is lenient with respect to the usage. Owners can legally store their wagons in front of their own premises, or in front of other premises with permission of the occupier, provided that two or more vehicles are not placed side by side, and that the authorities—who may use their discretion in the matter—do not see fit to interfere. In the poorer districts the aldermen are on the side of the wagon men, and interference with the objectionable custom is not often ventured upon. During his recent term of office Mayor Hewitt made a determined move to stop the practice. But notwithstanding his vigorous will the force of circumstances was too strong for him, and the effort proved futile. The necessity for keeping the highway clear must be of a specially direct and imperative character to secure official action. The objections to thus encumbering the thoroughfares are grave and marked. In some streets the curbs on both sides are literally lined with vehicles for blocks. They materially limit the capacity of the roadways, which are none too wide, and in cases of fire cannot help being hinderances and productive of expensive delays. Where they prevail, the street-cleaning machines are rendered useless. Coverts are supplied by them for dirt and rubbish which collect under them. Not infrequently they are lairs of crime and shelters for vagrants. However preposterous the proposition that the streets are maintained to be choked up in this way to save private individuals stable-room, the meek New York public quietly endures the abuse with all the inconvenience, additional fire risk, dirt, and other considerations involved.

The elevated railway company also appropriates space in the public highways which has not been granted it, by the simple process of taking it. It habitually stores large numbers of its cars on a third track in the streets through which its structure is built. The privilege of constructing occasional switches, such as may be really necessary for the operating of the road, has been stretched, especially in the case of Third Avenue, until the result is an unauthorized new track throughout much of the entire line. This third track darkens the street, and when occupied with unused cars that should be stored on the company's own property, obscures the view more or less to the discomfort of the residents affected. But the situation is accepted with characteristic American submissiveness. The posts of the elevated roads, which are planted directly in the roadways, are obstructions that perhaps, under the circumstances, are unavoidable. Still they limit the capacity of the street below, and more than one death has ensued by passengers of the surface cars heedlessly jumping against them in alighting.

The obstructions on the sidewalks are more numerous, if less serious, than those of the roadway. Those resulting from building operations have already been alluded to. The most marked are the appropriations for private business purposes. The stores and warehouses of the city are rarely supplied with courts or rear facilities for the delivery and shipping of goods. Public rights in the sidewalk have been practically ignored in the local commercial architecture. Either the wagons to unload or receive merchandise are backed directly up to the front doors of the warehouses, as is generally the case in South, Front, Water, and a number of other streets, or the boxes of wares occupy the greater part of the space between the curb and the building. In the wholesale grocery and dry-goods regions the sidewalks are mainly added rent free to the available business area of the abutting establishments. The plea of the offenders is that it would be impossible for them to do business otherwise. Owing to the faulty construction of the buildings there is much truth in what they say, but efforts to reduce the evil to a minimum are wofully lacking. The usurpation of the sidewalks by the retail men is of a widely varied character. There are instances to be found where a cellar only is rented by the dealer, and the street at its door utilized for exhibition and sale purposes. Grocers, fruiterers, cheap clothing and furniture men usually extend their wares far out on the public domain, and dealers of all classes put forth signs, portable show cases, or what not, with little or no regard for the ordinances regulating such practices. It is illegal to place signs or goods at a greater distance than twelve inches from the building line. Awnings must be "eight feet six inches high and no more" at the curb, and no "part of any cloth or canvas used as an awning shall hang loosely down from the same" under penalties. There are hundreds of awnings in the city which a man of medium size with a high hat cannot pass under without stooping. Petitions for the privilege of establishing booths and stands for the sale of small wares, refreshments, etc., have resulted in the issue of innumerable permits to that end, generally at the behest of men having influence to dispose of in return for votes. The chairs of the boot-blacking fraternity, in the aggregate, occupy a very considerable amount of out-door space. In some instances these booths and stands do not appreciably obstruct the highway, but in many cases they do, and as the effort of their proprietors is to place them where the greatest number of people pass, there is a constant tendency for them to accumulate precisely where they are the most objectionable. The venders who have no booths or stands, but carry their wares in baskets or suspended from their necks and arms, are obstacles to the currents of humanity that flow through the busy streets. The swinging of shoe-strings and other pendants in the faces of pedestrians and the solicitations to purchase are annoying, but the worst of this class of nuisances is the oratorical salesman of some catch-penny trinket or nostrum, who gathers a crowd about him which dams and delays the stream of people who have business of some importance to attend to.

The long-continued but languid and ineffective efforts to remove the obstructions created by the telegraph and electric-light systems have recently been stimulated into something like vigor by the killing of an uncomfortable number of people by electricity. Even after the dangerous features of the situation had been tragically demonstrated by repeated loss of life, the electric-light companies, consideration of the public safety notwithstanding, insisted upon keeping their deadly wires in the highway; and it was not until the Supreme Court of the State came to the rescue that the authorities could successfully assert their right to control the public property as against the companies. A telegraph pole eighteen inches or more in diameter, on a narrow sidewalk in a busy street, like Nassau or William, is an obstacle of some moment. It is a disfigurement besides, and its burden of wires, which in some cases number over a hundred, obstructs the space before the upper stories of buildings, and at critical times embarrasses firemen in their operations. Though it remains to be satisfactorily shown that the present subway system will serve all the purposes for which it was intended, a start has been made in the desired direction, and there is a prospect that the class of obstructions in question will be almost wholly removed before very long.

Another unpleasant occupier of the sidewalk is the ash and garbage barrel or box. In the better parts of the city this institution is kept in a reasonable state of subjection, and gives the pedestrian small cause for complaint save when its contents are in process of being dumped into a cart, and powdery portions thereof, wafted by the breezes, whiten his garments and get into his eyes. But in the poorer and tenement districts it is ever obnoxiously present. Often it is overflowing at the top or broken out at the sides, and the pavement is littered accordingly. Frequently the dwellers in these regions dispense with the form of throwing their refuse into barrels or boxes, and scatter it broadcast in the thoroughfare, where it remains for an indefinite period. Given this practice, trains of standing wagons at either curb, a snowy winter, and many of the city's side streets become practically impassable by the early spring. The idea that the highway is a proper place to throw refuse appears to be so deeply seated with a large part of the population as to be instinctive. Many proprietors and residents sweep out their shops and halls directly into the streets, and the passer-by is sometimes called upon either to dodge a broom load that is shot from a doorway, or receive it on his boots and trousers. The house-maid may not infrequently be seen shaking a rug out of an upstairs window, in serene unconsciousness of the fact that the highway is intended for people to walk in and for purposes of communication generally. It is scarcely necessary to say that there are laws in plenty against these offences. The fact that they have not been enforced has supplied the Street Cleaning Department with a ready explanation for part of its apparent remissness. It alleges lack of co-operation on the part of the Police, the Health, and the Board of Public Works bureaus. Certainly bad pavements, the constant tearing up of the surface, the out-door storage of wagons, the slovenliness of builders, and the throwing of refuse into the streets greatly add to the difficulty of keeping them clean.

The tides of city humanity meet with another class of obstacles caused by thoughtless individual conduct. The motives of the stout and presumably good-hearted old lady who keeps an impatient crowd waiting at the ticket office of the elevated road, bridge, or ferry while she is engaged in searching for the ever-elusive female pocket, deciding upon an appropriate coin, or counting her change, are not to be impugned; but she is a trying obstruction nevertheless. And there is in some unfortunately constituted individuals a natural perversity which seems to make them believe that they gain something by needlessly standing in the way of others. The understanding and appreciation of the value of the ethics of the thoroughfare have much room to grow in New York, with respect to both public and individual action. The desired improvement involves both a diminution in the usurpations of the selfish and inconsiderate, and the increase, on the part of the citizen, of the disposition to resist infractions on his rights as a member of the public. It moreover involves a growing determination that public officials shall do their duty, and that the advances of modern civilization as manifested in the streets of other great cities of the world shall be profited by in the American metropolis. Amos W. Wright.

THE NEW HARVARD GATES.

The new Harvard gates, of which we give a picture on another page, were completed in December last, just before Christmas. They are built so as to practically close the end of the quadrangle between Harvard and Massachusetts halls—two of the oldest buildings of the college. Formerly a plain rail-fence terminated here in two rough-hewn granite posts of Quincy stone, gray and cold-looking, between which swung an insignificant cast-iron gate; on class day a high board fence was built between the two old halls to exclude strangers. The present gates are the gift of the late Samuel Johnston, of Chicago, a member of the class of 1855, who desired that the approach to the college grounds should be made more dignified and impressive. He accordingly bequeathed $10,000 for a gateway, the building of which was, after a delay of some two years, intrusted to the architects Messrs. McKim, Mead, & White. The result of their labors has been to secure a design in perfect harmony with the venerable and dignified character of its surroundings. The buildings and gates are both in the style of the architecture of the Georgian period; and in the brick posts and walls of the gates the same mode of bricklaying is pursued as in the adjoining buildings, and even the color and texture of the older erections are obtained by a careful selection of brick from the Boston yards, so laid as to give an alternating effect of buff and black, and which, contrasted with the coping and massive caps of the posts, surmounted by huge round spheres, also the carved panels of Yorkshire sandstone, gives an impression at once of warmth and of age. The central gate posts are about six feet square and nineteen feet high. They bear on carved panels of Yorkshire stone, with fitting inscriptions, the seals of Harvard College, Massachusetts, and the city of Cambridge, the fourth being reserved to the donor of the gates, and bearing an appropriate memorial inscription. On the college side of the walls, to right and left of the gate posts, are two niches, crowned by sea-shells cut in Yorkshire stone, in one of which is a fountain springing from a small satyr's head, carved in bronze, set in the wall. The foundation of the entire structure is of the Conway granite of yellow tone, and of this stone is also cut the seat to the right of the entrance, another exactly like it on the other side of the inner wall, and the basin for the fountain. To right and left of the entrance are panels of Yorkshire stone sunk in the walls, the arc of one of which bears a quaint inscription taken from the first records of the college, and the other tells, with a certain pathetic simplicity, why those first pioneers stinted their household necessities to satisfy a spiritual one they considered the nearest of all. They little thought how their primitive "schoole" would burst the modest limits they had planned for it! By far the most elaborate feature of the whole design, however, is (very properly too) the gates themselves and the canopy above them, which form the centre of construction. These, like the forged iron fence and the smaller bay-yard gates at either side, are of the finest and most

.ES EMORY SMITH.

les Emory Smith, editor of the Philadelphia
Russia, the President has conferred a long-
me of the most conspicuous citizens of
ith is noted quite as much for his ability and sagacity as a journalist and man of affairs as for his prominence as a member of the Republican party. In either capacity his record has been admirable. As a journalist Mr. Smith has achieved for himself, and for the paper which he now controls, one of the most brilliant successes of modern journalism. It is in respect of this, rather than for his upright and consistent course in politics, that Mr. Smith deserves the honor bestowed upon him.

To persons at all familiar with the history of Philadelphia journalism, the work of Mr. Smith during the past ten years has been worthy of the highest commendation. When Mr. Smith removed to Philadelphia in March, 1880, the *Press*, of which he became editor and part proprietor, was in a sad state generally. Its fortunes were at a low ebb, while its rivals, the *Ledger*, the *Times*, and the *Record*, were riotously prosperous. Even the most casual observers soon saw, however, that the young man who had so rashly ventured in upon Philadelphia conservatism knew his business. The *Press* began to get the news and plenty of it, which must have surprised even the proof press in the composing-room beyond measure. Colonel McClure's *Times* no longer had a close monopoly of interesting Sunday papers, nor did the rivalry diminish during the other days of the week. Mr. Smith engaged in no quarrels with his neighbors, but contented himself with crowding his paper so full of news seven mornings a week that people had to buy it whether they agreed with it politically or not. As a newspaper's success is almost invariably proportionate to the quality and quantity of news that it contains, Mr Smith's policy had its reward. The *Press* grew in prosperity and influence year by year, until to-day it ranks with the best in the country.

Although he has always been a sincere Republican in political matters, Mr. Smith has never gone to extremes in partisan service, but has followed a middle course that has gained for him and for his paper the respect and confidence of the best elements of all parties. His utterances on political questions have been independent rather than partisan, with always a strong touch of sincerity that showed the earnestness of purpose behind them.

For the work which he has done in Philadelphia Mr. Smith had an excellent training in the city of Albany, New York, where he had been prominently engaged in journalistic work for fifteen years. During the ten years prior to his removal to Philadelphia he had been connected with the Albany *Journal*, first as an associate with Mr. George Dawson, and then as editor, after Mr. Dawson's retirement. Before that time he had been for five years editor of the Albany *Express*. For several months in 1868, while editor of the *Express*, he undertook, in addition, the duties of private secretary to Governor Reuben E. Fenton. Mr. Smith had shown an aptitude for journalism several years before he became connected with it. In 1858, after graduating from the Albany Academy at the age of sixteen years, he wrote leading articles for the Albany *Evening Transcript*. Six months later he entered the Schenectady University, from which he was graduated in 1861. Upon leaving college he became a member of the staff of General Rathbone, and for two years he assisted in the work of recruiting and organizing volunteers for the war of the rebellion. He exchanged this work for a position in the faculty of the Albany Academy, where he remained until he took editorial charge of the Albany *Express* in 1865. His interest in educational matters did not cease, however, for in 1871 he was made a trustee of Union College, and in 1879 a regent of the University of the State of New York.

MR. CHARLES EMORY SMITH, OF PHILADELPHIA, THE NEWLY APPOINTED MINISTER TO RUSSIA.
From a Photograph by Gutekunst.

While working as a journalist in Albany Mr Smith was well known also as an influential member of the Republican party. For six successive years he served as a delegate to the Republican State Convention. In the February Convention of 1880 he was selected as temporary and permanent president. In each of the other years he was chairman of the Committee on Resolutions, except in 1877, when Roscoe Conkling was chairman and Mr. Smith secretary. As New York member of the Committee on Resolutions at the National Republican Convention at Cincinnati in 1876 he drafted a large part of the platform. During important campaigns Mr. Smith has taken excellent rank as a Republican orator. His abilities as an after-dinner speaker also have made him popular socially, not only in Philadelphia, but elsewhere. It is the opinion of his friends that he will prove to be a highly successful representative of the United States at the court of St. Petersburg. Mr. Smith is still a young man in years and intellectual energy. He was born at Mansfield, Connecticut, on February 18, 1842.

THE NEW HARVARD GATES, AS DESIGNED, AND AS EXECUTED.—[See Page 143.]

particularly of those who were unused to high altitudes, and several deaths occurred among them during their long detention. The only doctor in the blockaded trains at Truckee was taken ill with a congestive chill, so that medical advice was lacking, and the medical stores obtainable were insufficient for the needs of the imprisoned travellers. The passengers sought every means to enliven the weary days of their waiting, and tried to forget the bleakness of their surroundings in cards, dominoes, extemporised games, and even by amateur theatricals. These cars were kept lighted and comfortably warm; and in every case where a passenger requested it, he was supplied with food by the railway company. About a hundred miles of track was blockaded, the deepest and least penetrable snows being near the summit of the mountain range, at a point known as Cascade, where a bridge spans a foaming stream. Here the snow-shed ordinarily relied on to protect the track had been burned during the past summer, and the snow lay upon the track twenty feet deep.

At Blue Cañon and other parts of the line near the summit not only the roadway but the station buildings and the houses of the little towns were literally buried in snow. So deeply were some of the smaller dwellings covered that, in order to keep up the fires within, the chimneys had to be dug down to, and extended by means of stovepipe or barrels, and people went in and out of their houses through holes in the roof. The hotel at Blue Cañon was so nearly overwhelmed by snow that its lower door could only be reached by means of a tunnel thirty feet long. Previous to the blockade, in anticipation of severe winter storms, the railway company had stationed snow-ploughs, extra men, and boarding camps along the line, and other extraordinary precautions had been taken to meet the contingency of the heavy snowfall; and when it came, the efforts of the railroad managers to reopen the line of traffic were incessant and untiring, all the knowledge gained by previous experience and every expedient suggested by the immediate emergency were used.

At the beginning of the great storm the railway company had two great snow-ploughs of different models at each end of the blockaded track, and they were set to work with vigor to break a way through the snow. The rotary plough, coming from the Pacific slope, worked eastward, and the cyclone plough, starting from Reno, worked westward toward the centre of the

could keep awake no longer, the fires in the engines were allowed to burn low, the brakes were set, and all hands tried to snatch a few hours' sleep. The last and greatest struggle during the blockade took place on the easterly side of the Cascade bridge. A passage had been broken to the bridge, and all the track on the westward behind the plough was clear, but beyond the bridge rose a high bank of hard snow, which, for a mile and a quarter, varied from fourteen to twenty feet in depth. Against that mass the rotary plough started, and pushing across the bridge, which shook beneath the grinding driving-wheels of the locomotives, attacked with its blades the face of the bank, and slowly forced its way into it, while the hoppers hurled the snow in a mighty stream far over the bank and into the cañon below.

The cyclone plough, a gigantic machine which works on the principle of an auger, did not give good results during the last storm. Its trial upon the road on this occasion being of the nature of an experiment, everything seemed to go wrong with it. The machinery got quickly out of order; it was delayed a number of times, broke down on the road once, was for a while lost sight of, then laid up with a hot box, and when it reached the snow it was found unfit to combat with drifts of considerable depths. It was too large to pass through the snow-sheds wherever they were at all crushed out of shape; and thus the heaviest labor fell upon the rotary plough. The cyclone plough is shaped like a large box car. Projecting in front is a large worm, or auger, which bores in, and draws the snow into a hopper that revolves at a high rate of speed. The hopper throws the snow through a funnel to a distance of about two hundred feet from the track. The cyclone plough is operated by six engines, representing 600 horse-power. In future experiments it may give better results.

Besides the two great snow-ploughs, which represented the heavy artillery used in the attack on the snow, a force of 2500 men, picked up wherever they could be found, and paid high wages, was at work with shovels and pickaxes upon the snow. The railway company estimates its loss during the blockade at $75,000 a day, or more than $1,000,000 during the entire period, and this reckoning is exclusive of the coming repairs which the disaster has necessitated. The telegraph companies found great difficulty in keeping their lines open, and despatches were greatly delayed. In places the snow lay two feet upon the

was received with great enthusiasm. His correct habits of life and his just dealings with his neighbors led them, irrespective of their political predilections, to part with an unusually large number of compliments. All this made Abner's wife Jane happy. Politics wasn't such a bad thing, after all.

But gradually the enthusiasm began to cool. Abner's party opponents, seeing the necessity of finding some weakness in his candidacy, quieted their consciences with the fine things that they had said, and proceeded to manufacture campaign material, with that busy and irresponsible iconoclast Rumor at the head of the enterprise. It then came about that Abner's just dealings were nothing more than extortion, and that his success was an affront to every neighbor of different political belief who had not succeeded. Who was he, anyhow? Simply a poor country boy, who had got along in some mysterious way, and had now reached the eminence of a high place on the ticket, when there were older men in the district who should have had the honor. This talk pleased the older men, and although outwardly supporting Abner, they had hard feelings in their hearts, and seemed to listen to the talk against him with a complaisant air of secret gratification.

All this Abner saw and appreciated. He went down to town, and had a long talk with Colonel Short, the party leader, or better known as the "boss." The colonel was affable and interested.

"I understand it perfectly," he said. "It is always that way, and we'll have to whip those fellows into line. We're going to have a pretty hard fight this year, and we've got to pile up a handsome majority in Sussex District to help us out. The best way is to begin by getting up the biggest meeting you have ever held. Your store at the Cross-roads is a central point, and there is no reason why you should not draw a crowd. Who is the worst man you've got to deal with?"

"Old Silas Legg is about as bad as anybody. I traded horses with him once, and he has never got over it."

"Yes; I know him. He isn't much account, but you can make him chairman of the meeting. How about the speakers?"

"There is Major Powderdry. We'll have to have him, and yet if he gets started he'll talk all night."

"And say nothing. Well, invent some means to shut him off. I'll send Carr, and you can get some of your neighbors to make a few remarks,

Erastus Crawley had a conscious air, and occasionally his lips moved, as if he were trying to keep his impromptu speech well in memory. Young Carr sat with the easy grace of an experienced speaker, and, like a good politician, looked for his inspiration in the faces of the rosy-cheeked country girls in the audience. More prominent than all of these was Major Powderdry, who was trembling on the threshold of his greatest effort. He crossed and recrossed his legs until his trousers were in danger of being worn out. He talked first to one neighbor and then to another, and waited with great impatience until the party men of the district had got seated on the stage. Then arising, and kicking down his trousers, which through too much movement had climbed up to his shoe tops, he exhibited his large expanse of cuffs, and said,

"Ladies and gentlemen, I move that the Honorable Silas Legg, our distinguished fellow citizen, be made chairman of this splendid outpouring of the people."

The motion was seconded, and Mr. Legg, whose "honorable" had come from one brief term in the Legislature twenty years before, arose, and slowly moved to the small table in front. He bowed to the applause, bowed to the platform, and bowed to the audience. Then, in a piping voice, he thanked the people for the compliment, and spoke of the pride of the district in the nomination of "that citizen whom we all love for his ability and integrity, Mr. Abner Green, our next sheriff." There was great applause; and Jane blushed, and felt very proud indeed that she had such a husband. Mr. Legg referred to the party; told the people that they ought to cast their votes "early but not often," and then said he would not delay the proceedings with any further remarks, but would introduce a man whom they all knew and all honored—the Honorable Erastus Crawley.

Mr. Crawley, who likewise had been in the Legislature, moved to the front with the easy grace of a Dutch steam-ship lurching into port. He raised his hand and began.

"Fellow-citizens, I did not expect to make a speech, but no man who loves this party as I love it can face this assemblage and wish to be quiet. It is a proud privilege to appear before you, and to say a few words in behalf of the splendid ticket that our party has placed in the field—a ticket sound as a dollar and good as gold—a ticket which contains the name of our friend and neigh-

"the ides of November" from the major, and made him change his words. But fortunately the rest of the speech differed entirely from Mr. Crawley's, and the major had no difficulty in rolling off his long and tedious phrases. Once fully started, he was like a boat launched in the tide; he kept on going until—until—

Yes, until something happened. It was while he was growing eloquent over the "matchless and deathless principles of our glorious old party" that a strain of music with sundry shouts came from down the road, about a hundred yards away. The major drowned it with his voice; but up it came again, louder than ever. Quickly some secret telegraph spread it around that there was a performing bear in the vicinity. The news had a wonderful effect. At first, those on the outside slipped away. Then the benches began to be emptied. The major talked on with brave resolution; but what was a mere orator in a country district to a performing bear?

Abner Green was in dismay. Only the women and a few men were left in the audience. His meeting was on the verge of failure. He called a man, and found out the trouble. He did not hesitate.

"Keep it going, gentlemen, till I get back," he said. And jumping off the platform, he hurried to the road.

The plotters of the opposition quickly mingled with the crowd when they saw him approaching. He came on, with his face full of determination. It had been many years since he had seen a bear, but his curiosity was overwhelmed in his desire to save the meeting.

There, in the centre of the crowd, the poor old bear was dancing to the discord of an asthmatic bagpipe. Abner marched boldly into the arena, and demanded the cause of the interference. The man promptly replied that he was on his way to town, and that some young gentlemen had paid him a dollar to give a performance.

"Come with me," whispered Abner, "and I'll give you two dollars; and if you don't come, I'll have you arrested."

The two dollars was a stronger attraction than the threat. Very promptly the man, leading the bear, followed Abner Green, and behind them came the crowd that had forsaken the meeting. The animal produced a great sensation. Major Powderdry took a recess; and when it was seen that Abner was going to have that bear give a brief performance on the platform, the excitement reached an intensity that had never been known in that neighborhood.

"He is harmless, gentlemen," was Abner's assurance; but it did not assure the distinguished committee-men and officers. They did not care to share the honors of the platform with a bear. Hon. Silas Legg surrendered the chairmanship, and became an humble spectator; Hon. Erastus Crawley thought he would rather see the proceedings from the audience; and Major Powderdry, with a look of supreme contempt, retired to the corner of the stage, where he could easily jump off at the first sign of hostility. Abner Green remained bravely at his post.

"Ladies and gentlemen," he said, "we not only defy the opposition, but we capture their ammunition; and we are going to show you the kind of arguments that they use, by letting their animals give a little show." (Applause.)

Abner motioned to the man, and he came forward with the bagpipe and the bear. He played a tune—or an apology for a tune—and Bruin danced to the music. Everybody was all attention. The performance met with great applause, and a second instalment was called for. Abner had secured the undivided respect of every man and woman in the place.

"Now, ladies and gentlemen, we will have some more speech-making. Nothing like variety, you know."

The man and the bear retired. The animal laid down on the far corner of the platform. Major Powderdry saw the field open, and he advanced to finish his speech. Abner was sorely disappointed. He had hoped the major would not try again; but the major was not the kind of man to spend a week over his greatest effort, and have it ruined by such untoward circumstances. He began at the safe corner of the platform, but his eloquence being of the moving sort—especially in its effects on himself—he gradually warmed up to his words and moved to the centre of the stage. His oratory was never better. The audience was interested, and the bear was quiet. Presently he reached a climax that called for applause. It came vociferously. Abner joined in it by stamping on the platform. The bear woke up and growled. The major looked around, and seeing Bruin, promptly returned to his safe corner for security.

Again he proceeded. Again he waxed eloquent. Again there was applause. Again Bruin growled, and again the major retired from the centre of the stage to his corner.

A third time he started out to awake the echoes.

"In the multiplied industries, the diverse interests of our glorious nation," he said, "what party has afforded the most sacred security to our advancing progress? What principles founded on justice and built by experience, compassing the munificent wisdom of past history with the magnificent practicalities of the golden age of the present, have given the rich incentives to our expanding civilization, the splendid promise of freedom and safety to our sovereign citizenship, and the sure protection against extravagance in our public affairs? What principles I say—and I repeat it with all the earnestness of my soul—what principles except those which are embodied, like jewels in rich settings of gold, in the platform and practices of our great and glorious old party?"

There was tremendous applause. The people clapped their hands and hurrahed. Abner stamped on the platform with all the force of his heavy new boots. And suddenly the bear, with a noisier growl than ever, arose to his feet, and made a step forward. The major heard him, and saw him advance. In his heated imagination, warmed by the fires of eloquence, he fancied a whole drove of bears coming upon him with distended jaws. He did not tarry, but with a leap cleared the stage, and took refuge in the audience.

Great excitement began, but a panic was easily averted by the man, who took hold of the chain and pulled the animal back.

Abner again came to the front. "That was a beautiful speech of Major Powderdry's," he said. "It was sound and reasonable and eloquent. Now, to show you a contrast, we'll have another of the sort of speeches our enemies use."

This reassured the people, who caught the full spirit of the fun. The music began, and the bear advanced in the usual way. While the performance was in progress, Abner retired, and called some of his men to him.

"Get this man and this bear away from here," he whispered. "Drive them down the road, and threaten to hang the man to a tree if he don't get out of this neighborhood. And mind, do it quietly."

When the dance was over, Abner took the man to the rear of the stage, and placed two dollars in his hand. As he did so, he whispered:

"Get away from here as quietly as you can, and leave the neighborhood. If you don't, we'll string you to a tree."

The event had filled the poor wanderer with astonishment. He had been so dazed that he scarcely remembered his old tunes. The amazement kept on increasing, and this last admonition settled him. Grabbing the money and holding it tightly, he got off the platform, and pulled the bear after him. Then, plunging into the darkness, he fled from the place.

Quite promptly and complacently Abner came to the front again. He had bloomed out on the platform all at once. It surprised no one more than himself to find that he was talking in a good voice to so many people whom he had never faced collectively before. It was the excitement and the needs of the hour that developed him. He introduced Mr. Carr with a vigorous flourish of compliments, and the young orator proceeded to give the people a strong, practical, persuasive speech, illustrated and brightened by good stories that kept every one amused and interested, his remarks being so entertaining that the bear was for the time forgotten.

It was getting rather late—late for the country, of course—when Carr finished; but he saw that the people were not especially tired, and he took Abner's breath away by saying that he was sure everybody wanted to hear a few words from the candidate for sheriff. He was shrewd enough to observe that Abner had in him a strong vein of eloquent common-sense. His handling of the bear incident showed that. Abner hesitated; but when the demand became urgent, he arose and tried to say something, looking to Jane for his inspiration.

"Ladies and gentlemen," he began, "I am no speech-maker; but as the representative of this district on the ticket, I feel proud of the honor, and I tell you squarely that I want your votes. ["You'll get 'em," shouted a voice.] I believe I will, my friend; and I tell you now that some people will have about as much success in downing our ticket as they did in trying to stop this meeting. [Great applause.] We'll not only capture them, but their bears and all the other animals in their menagerie. [Renewed demonstrations.] Fellow-citizens, I'd like to say one word about that bear. You noticed him, didn't you? Did you ever see such a bear? [Laughter.] He was strong and healthy, and yet he looked poor and weak and ashamed—looked as if he had lost his self-respect and independence. Now think a minute. What does that bear do? He does all the work. He does the dancing, while the man with the wind-bag plays the music. So far so good. Now, when the money comes in, who gets it? The bear that makes the show a success, or the man with the wind? Why, the poor old bear don't get anything. If sugar-cured hams were a cent apiece, he would never know the taste of them in a year. [Laughter.] The man just plays, and the old bear dances, and I wouldn't wonder if he was fool enough to think that he was doing the right thing. [Laughter.] Now, it strikes me, fellow-citizens, that our friends on the other side have sent us a first-class specimen of their way of running their party. ["That's so!" said a voice.] I see before me some good members of that party, and I see some colored voters who belong to it, too. Now I ask them if their bosses have not been playing on the wind-bag, and making them do the dancing. [Laughter.] Haven't they cast the votes, while the bosses stood around and waited for the prizes? Who got the proceeds? Why, fellow-citizens of the other side of the fence, you have been doing all the work, and you haven't got a smell of the results. [Laughter and applause.] You are the bear, and the bosses are the firm that plays a little campaign music, and takes all the offices. [Great laughter.] Why don't you come into a party that treats you like men, that respects your independence, and glories in your manhood? [Great applause.] You have heard the splendid speeches here to-night. These men talked to your reason; they didn't play on wind, and expect you to do the dancing, while they put the money in their pockets, and left you to prowl around the corn fields for your supper. [More laughter and renewed applause.] Come into an honest party. We've already got a big majority, but there's always room for more; and we will see that you will be treated like free American citizens, and not like animals to be trotted out once a year to do the voting for somebody else's profit. I thank you, ladies and gentlemen, for your kind attention."

There wasn't any applause too fervent for Abner Green. He had spoken in a homely, forcible way, carrying everybody with him. Mr. Legg's piping words, Mr. Crawley's tumultuous blows, Major Powderdry's voluble rhetoric, and even Carr's able arguments, were forgotten in the apt and telling illustration of the candidate for sheriff. The people were astonished at his performance, and were proud of his success, and they crowded to the front to shake him by the hand.

"Abner," said Carr, "that is worth a hundred votes."

But Abner shook his head, and began to compliment the other speakers. He thanked the Hon. Silas Legg for his kindness and his eloquent words; he thanked the Hon. Erastus Crawley for his magnificent speech; he thanked Major Powderdry for his splendid address—"the best I ever heard, major; as fine as anything any orator could do."

And so everybody went home pleased and satisfied.

Carr spent the night at Abner Green's. When all the people had gone, Carr and Abner and Jane sat down to a little supper which Jane had prepared. Jane was prouder than ever of her husband.

"That bear was very funny," she said; "but it was too bad for it to scare poor Major Powderdry so! Wasn't it, Mr. Carr?"

Carr looked at Abner, and noticed a vagrant smile steal over his face.

"Abner, how did you manage it?" he asked.

"Oh, I didn't do anything! There was a loose board on the platform. I was sitting on one end of it and the bear was on the other end, and somehow when I applauded, the board flew up and hit the bear, and the bear didn't seem to like it. Carr," exclaimed Abner, "that bear saved the meeting. Some kind Providence sent him here to-night. If it hadn't been for him, the major would have talked all night."

Jane laid down her knife and fork, and gazed sadly at her husband.

"Abner," she said, as she shook her head, "I'm afraid politics will be the ruination of you."

But Carr declared that it was the best thing he had ever heard of, and he accused Abner of having the bear around on purpose; but Abner denied this, and said it was nothing but pure good-luck, "which," he added, "is better than riches, and almost as good as a campaign fund."

A HIGHLY DEVELOPED POSTAL SYSTEM.

BY JULIAN RALPH.

It seemed to me that in England the biblical adage should be altered to read, "The poor and the post-office ye have always with you." It may have been mere coincidences, but wherever I lived or stopped, there was always a post-office around the corner. When I was at the Hotel Victoria, in London, the post-office was at the Strand and Trafalgar Square; at the Tavistock it was on the next corner. So it was when I tried boarding in Bayswater, and so it continued at Henley, through Kent and Devonshire, and in Birmingham and Liverpool. I may have been in little villages that boast no post-offices, but I am inclined to doubt it, for whenever I wanted one, in no matter how tiny a place—even in Clovelly or smaller places in Devonshire—it was always close at hand. There are 9000 post-offices according to the penny hand-book of the department; but whether they include the ones I found maintained in little stationery and general shops is a question. The one nearest to the Stork Hotel in Birmingham consists of one counter in a little shop for the sale of pens, ink, paper, and penny goods for children; and the one in Clovelly is inextricably combined with painted shells and watering-place kickshaws of all sorts.

But an English post-office is very little like an American one. In no other single view one gets of English life is there such a wide contrast between our customs and theirs, or so marked an example of the lengths to which monarchy, even as diluted as the English, may lead as in the British post-offices. An American may entertain a Jacksonian hostility to the principle underlying that postal system, but he cannot help finding the finished result a very convenient institution. At any one of these always handy offices he may post a letter, express a package of or under eleven pounds weight, send a telegram, or procure a money-order. But to the Britisher the neighboring post-office is vastly more important. There he may mail, register, or insure his letters, obtain postal money-orders, send telegrams, insure his life, express his parcels, deposit his weekly or daily savings, buy an old-age fund or arrange for an annuity, obtain the correct time from the Greenwich Observatory, post himself upon the arrival and departure of all trains and of all ships sailing to and from every nook and corner of the world, and get a forecast of the next day's weather.

There is little about the arrangement of or methods in an English post-office that strikes an American as peculiar. One strange fact is that everything done there necessitates the use of stamps, and they must always be affixed by the purchaser. When you send a telegram, you must put the price of it in stamps in the upper right-hand corner of the printed form, and when you deposit money for insurance, annuities, or as a savings fund, you make the payment or deposit in stamps, which no one behind the counter may paste on the form that they are to go upon. Another oddity is that though you get your letter weighed and buy your stamps in-doors, you must always go out-of-doors to post it. The employés in the office are separated from the mail matter—plain or registered or insured, whichever it may be. The letter slits are in the outer wall of the building, and you must pass out of the door to mail your letter.

The English go further than to merely register a letter. They insure letters as well. Every letter on which only the stamps for postage have been put is insured to the amount of one pound ($5), and that sum will be paid if it be damaged or goes astray, and if the Postmaster-General be satisfied that it was of that value. Registered letters cost twopence extra, and carry with them a guarantee of five pounds, in case they are lost or damaged. For still another twopence the insurance is raised to ten pounds, or whatever part of that sum the proven loss or damage amounts to.

The government or post-office savings-banks are distinctly the depositories of the poor. You cannot bank money at a post-office if you have an account in any other savings-bank, and you may not deposit more than $150 in a year or $750 altogether. Interest is not paid on less than a pound, and then only at the rate of twelve cents a year on five dollars. After the limit of deposit is reached, the depositor can buy government stock, provided he does not buy more than $500 worth in a year, or more than $1500 worth altogether. He may withdraw all his money from the post-office bank at a day's notice, and he can sell his government stock at the market-price the moment he desires, a commission being charged for the sale. There is also a charge of a commission of ninepence on all purchases exceeding twenty-five pounds' worth of stock. Thus, in all ways, private banks and brokers are measurably protected against undue rivalry by the government. Whenever a deposit is made in a post-office bank the depositor gets an acknowledgment. Deposits are made by filling regularly prepared forms with postage-stamps representing the amount deposited; but in opening an account the depositor must also hand in a written declaration that he has no savings in any other savings institution. This declaration must be witnessed by an officer of the Postmaster-General, or a clergyman of any faith, or a justice of the peace, or a commissioner to administer oaths—that is to say, a notary public.

The life-insurance business is a feature of the banking business. Any person of fourteen years or not more than sixty-five years of age can insure his or her life for any amount from £5 ($25) to £100 ($500). The sum insured for may be made payable at death, at sixty years of age, or sooner if death occurs before that age is reached, or on the expiration of 10, 15, 20, 25, 30, 35, or 40 years, in case death does not occur before such period is closed. The payments for life-insurance are made in the same way as savings-bank accounts are kept, and the annual payments may be made in any sums convenient to the insurer. Interest on a bank deposit may be credited to the insurance account. No medical certificate is required when the insurance desired is only $125 or less. If an insurant cannot continue his payments for any reason, the National Debt Commissioners will specify what proportion of what he has paid shall be returned to him.

Annuities are popular, I was going to say, in England; but, upon second thought, it occurs to me that they are equally highly regarded everywhere. But in the older countries, where there is a greater proportion of inherited wealth than in ours, it is in the annual form that incomes are calculated or received; and the English government shows an appreciation of this in establishing these funds, by which what may be called self-pensioning may be effected. Immediate annuities are purchased by the payment of a lump sum. A pound a year can be gotten for a five-year-old boy for £25, 9s. A thirty-year-old man must pay £224, 10s., 10d. for £10 a year; a woman of that age must pay one pound and six shillings more, because her "expectations of life" are better. The government will not contract for a greater annuity than £100.

There is also provision for what is called Old Age Pay, or deferred annuities. In this branch of what the crown calls its "Aids to Thrift," a contract is made with the government for the payment of a fixed sum after a certain lapse of time, when the insurant shall have reached a specified age. A man aged twenty-four, who wants to be sure of a pound a year when and after he is fifty-four years old, must pay $1.08 cents (or four shillings and fourpence a year—two cents a week); or he may pay down a lump sum of £3, 19s. 11d. Deposits upon a contract for Old Age Pay are made at all the post-offices in precisely the same way as savings are deposited; indeed, an account like a savings account must be opened in order to make such a contract.

As the government owns the telegraphs, the post-offices are the only telegraph offices excepting those in railway depots and the stations of the cable companies. The rate for telegraphing is sixpence for a dozen words, and half a cent for each additional word. You must pay for every word you write, including the address, and to insure accuracy by repetition half the price of the telegram must be added; but that is done as little there as here. If you are expecting a great deal of telegraphic correspondence you may effect a saving by registering a cipher address such as "Andes, London," instead of "J. Hammersmith Mitchell-Andrews, 312 Archer Street, Notting Hill, London." This will cost you only £1 1s. or $5 25 a year. You may write all your telegrams in Latin or in any European language for no extra cost; but if you use invented and unintelligible words, they will cost you ten cents extra each. In the cities, telegrams are delivered at the distance of a mile for nothing; but in the country this so-called porterage costs a quarter of a dollar a mile, and in Ireland sixteen cents. Persons living in the country may hand their telegrams to the letter-carriers, or stamp them and drop them in the letter-boxes.

You may rent a private wire wherever you live, and have it run from any point to any point. It

servant for the sum of $3 75 a year, or for keeping a carriage. A one-horse team costs $5 25 a year, and a double team twice as much. If you possess a coat of arms, but never use it or display it, there is no tax upon it; but if you paint it on your carriage, you must pay $10 50 for the pleasure. If you have no carriage but display your bearings on your letter-paper, that amusement is considered worth £1 1s. A game license costs $15 a year, and $10 extra for a gamekeeper.

Naturally a person who lives by his pen would have more occasion to use the post-offices than an ordinary tourist, and better ability to judge them fairly, under which heading I have nothing but praise for all the foreign posts I used, though they could not be more reliable than ours at home. But I found the English postal stations of great service beyond my requirements from the mail. When separated from friends, and when travelling to meet them, without accurate knowledge of their whereabouts, it became my tried and satisfactory habit to leave written word at the village post-offices. Once I lost a document of great value. Discovering the loss in one village, I imagined it to have occurred in another, and it was eminently satisfactory to be able to pick out one in six or eight houses as a telegraph and post office, and communicate instantly with the village we had just left. That could not be done in such small places in America. Later, while retracing my steps, I posted notices of the loss in the post-offices of the villages I had stopped in, confident that practically all the people in each place would see the placards there more quickly than anywhere else. When I reached London the lost document was awaiting me there.

The thrift of the British government and of the British people is shown in the manner in which the Post-office is "worked," and in the manner in which the people support it. Every branch of the department is maintained on business principles that have increased its profits from £1,280,000 sterling twenty years ago, to £4,000,000 sterling to-day. This is quite as creditable a showing for the government as the four million separate accounts in the Post-office savings-banks (representing deposits of £54,000,000) is for the people.

BANKS AND BANKERS.

WALL STREET has ceased to occupy itself much with the affairs of the Sixth National Bank and the two small State banks—the Equitable and the Lenox Hill. The Sixth National is known to be in good condition again, and its restoration to the Clearing-house is only a matter of time, while its daily clearances are at present made through the Gallatin National Bank. The scandals and crimes, however, which caused the suspension of the Sixth National and the Equitable and Lenox Hill concerns are not yet done with, and the whole affair still properly claims space in the columns of the daily papers. The proper steps to fix the guilt of the bank wreckers, and to bring upon them the penalties of the law, are being taken in the manner contemplated by the law, and the incident has accordingly ceased to figure among the causes which influence the money and stock markets.

It is noticeable, however, that the general public does not take so positive a view of the recent bank scandals as that which is taken in Wall Street. The stoppage or failure of a bank, from whatever cause, always excites a storm of feeling in the public mind, faithfully represented in the daily press, and usually so violent as to include in its condemnation all who are brought into important connection with the broken institution, even if they touch it only to repair loss or prevent the disaster from spreading. The business of a bank of deposit and discount, though of the most matter-of-fact nature, is a mystery to the mass of the community, and stories which would find few believers if told about men engaged in mercantile business are quite popular when told about bank managers. Hence on every occasion of a bank failure we read in the papers statements that are well suited to frighten people who have some money and very little knowledge of business—statements which would imply a general looseness of bank management, such as in fact could not long exist without wide-spread disaster as its natural result.

The banking business has been very largely developed of late years, and the number of people directly interested in it as depositors is correspondingly increased. Experience has shown the general safety of the system, so that fortunately we have gone along for many years without any general uneasiness on this score, and even without cause for it. And why? Chiefly because of the effective measures promptly taken in every case of trouble. The Bank Clearing-house of New York, comprising in its membership practically all of the important banks, with the less important concerns making their clearances, or daily settlements, through individual members of the Clearing-house, has a standing committee which has special powers to act in cases of embarrassment. A report of trouble reaches the Clearing-house, and the Clearing-house Committee at once visits the bank in question, examines its affairs, and proceeds to act, with the controlling purpose not to let the bank fail if it is solvent. If the securities requisite are there, the embarrassed bank is carried safely through its period of difficulty, and the mischief is not allowed to spread. This applies to banks that are members of the Clearing-house; if they become embarrassed, but yet are solvent, they are saved by the Clearing-house Committee—have been saved in the past, and will be in the future. In the case of a bank not a member of the Clearing-house, it still has its connections more powerful than itself, and it is saved if worth saving. The action of bank managers generally in such cases is conservative in a high degree, and has always been successful when the materials for success existed.

Nor does this action of the Clearing-house Committee involve any covering up of wrong-doing. There is discipline as well as help in it; the interests at stake are too great to permit of trifling, and the committee, from official position no less than from personal character, feels responsibility equal to its power. Moreover, and this is very important, wrong-doing in such cases could not be concealed even if bank presidents conspired to conceal it. The greater part of our banks are under the national system, and are open to the visits and examinations of Bank Examiners appointed by the Comptroller of the Currency. One of the great benefits of the National Bank system is that it has bred a class of Bank Examiners to become real experts in their business; and their responsibility to the Comptroller of the Currency makes them independent of local influences. They have the advantage of great experience and constant practice, and the public gets the benefit of this when their services are needed. In the case of the Sixth National Bank, for instance, when Mr. Hepburn, the Examiner, stepped in, he became virtually the Receiver of the concern, and so held it until the action of the committee and Mr. Leland enabled it to resume business. Concurrently with Mr. Hepburn's action began the proceedings before the United States Commissioner, now going on; the whole machinery of the National Bank law having been promptly set in motion to bring to justice the conspirators who robbed the bank. In the case of the defrauded State banks the State law is taking its course; not so quickly as the national law, but with every prospect of substantial justice being done. The agents of the State banking laws have a smaller field and less practice, but we may depend upon it that they are on their mettle, and will give a good account of themselves.

The recent cases are cases of atrocious robbery, and bear no resemblance to the insidious dangers caused by bad debts and decaying investments. In such cases the Bank Examiners have great power, and can force a bank to charge its real losses to profit and loss. This is naturally a slow process, owing to the enormous mass of securities to be investigated. But every calamity among the banks makes bank officers more strict and vigilant, and we may also count upon its increasing the vigilance of the official independent Bank Examiners.

HENRY J. MACDONALD.

NEW YORK, *Friday Evening, February* 14, 1890.

TAKE CARE! THERE IS DANGER

In allowing inactivity of the kidneys to grow through neglect. The deadly shoals of Bright's disease and diabetes will wreck the goodly bark of health if it is allowed to drift rudderless upon them. The bladder, too, if inactive, and judicious medication does not speedily direct the helm toward the port of safety, will be whelmed by the quicksand of disease. In selecting a diuretic, let your choice fall upon Hostetter's Stomach Bitters, which stimulates the renal organs without irritating and exciting them, two effects to be apprehended from the unmedicated stimuli largely resorted to. These have a tendency to react prejudicially. The Bitters invigorate the kidneys and bladder, in common with the nerves and the digestive organs, and so afford lasting aid. It also affords dual assistance in preventing and curing intermittent and remittent fever. Biliousness, constipation, and rheumatism it also subjugates.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

COUGHS AND COLDS.—Those who are suffering from Coughs, Colds, Hoarseness, Sore Throat, etc., should try BROWN'S BRONCHIAL TROCHES, a simple and effective remedy. They contain nothing injurious, and may be used at all times with perfect safety.—[*Adv.*]

IMPERIAL GRANUM
Is the safest, most reliable, and wholesome FOOD for Infants and Children. The most nourishing, strengthening, and delicious FOOD for Nursing Mothers, Invalids, Convalescents, and the Aged.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

THE strong feature of Nicholson's Liquid Bread is that while a pleasant, refreshing beverage, it assists the constitution to overcome the various weakening and wasting maladies. Ask your druggist or grocer for it. Do not fail to try it.—[*Adv.*]

1775–1783.

ARMY UNIFORMS IN THE UNITED STATES.

BY HENRY LOOMIS NELSON.—ILLUSTRATED BY H. A. OGDEN.

THE uniform of the United States Army is not splendid. It is hardly interesting. It would be very easy to secure from officers and men adverse verdicts of its adaptation to the needs of those who wear it. There is something sombre about the dark blue blouse and the light blue trousers of the enlisted men—the former relieved by a single row of buttons, and the latter by a red, yellow, or white stripe, according as the wearer is artilleryman, cavalryman, or infantryman. It is not the best uniform that can be devised for field work. The trousers are always too tight, and there are no gaiters into which their bottoms can be gathered and prevented from catching up and accumulating all the loose stuff of the highways and byways, the fields and forests. We are behind the rest of the world in our uniforms, as we are in arms and all munitions of war. The United States Army is not equipped either for show or service. Some of its officers, indeed, make a gallant spectacle in their full-dress—a major-general, for example, with his broad buff sash over his shoulder—is an imposing person; but even he could stand a good deal more gold-lace than the regulations permit. Perhaps the officer who is most impressive is a handsome young cavalry adjutant, with yellow plume and facings and his gleaming golden aiguillette. In a long parade of American soldiers there will be some bright spots, but they will be only here and there; there will be very little of the pomp and circumstance of the military shows of Europe. Wherever the army is a leading institution of the state, there is not only a great deal of magnificence, but very much variety in the uniforms of the troops. Although the prevailing color of the coats of the British Army is red, there are other colors worn by some of the regiments. The Household Cavalry of the Guards, and the Third Regiment of the Foot-Guards, for example, are clad in blue; while the buff coats and cuirasses of the Lifeguards and the Buffs date back to the days of Charles II. There are also the Scotch and Irish regiments, who wear their national colors. On the Continent the variety is quite as great. A great procession of handsomely uniformed troops is the finest spectacle that men can present to their fellows; but ten thousand men in blue, in heavy marching order, trudging behind a half-score of inefficient buglers, do not inspire the on-lookers with anything but a sense of weariness. It is true that the troops who show themselves in this garb look to be capable of attending thoroughly to their soldierly duties, but it ought not to be necessary to give that assurance on gala-days. What the spectators want on such an occasion is all the splendor in which the soldiers, regular and militia, can array themselves. When a command is as large as the Seventh Regiment of New York, there is no reason why it should not have its distinctive uniform, at least for holiday and parade occasions. If the regular army were as large as it ought to be, there could be no objection to variety of uniform in its ranks, especially in facings or peculiar forms of hat, or other distinctive features of dress, indicating any event or recalling any heroic incident in the history of a corps. However that may be, it is now useless to urge a change of the uniform system of the regular army, and it is undoubtedly well to insist on a State dress for all but large bodies of militia. The objection to variety is that it breaks the apparent solidity of a column, and it is unquestionably true that variety of color in small patches, such as we used to have in New York before the State adopted the regiment as the unit of organization, makes processions look a good deal like huge party-colored clowns.

Uniforms, determined and designed by the government, are of comparatively modern origin. In Great Britain, for example, it was not until the seventeenth century that the government defined uniforms for the army, and it was not until George III. was on the throne that a uniform was prescribed for the Navy. There was a time when each man-at-arms wore whatever defensive armor his lord gave to him. Before Charles II. began the formation of the Household Guards, the basis of the present standing army of Great Britain, the military force of the kingdom was the militia of the counties, commanded by the lord-lieutenants, and officered by the gentry. The law of that day did not exempt any Englishman from the burdens of arms, but he was not necessarily compelled to do service himself. He was simply obliged to maintain, or to help maintain, a man. If his landed property returned to him an income of five hundred pounds a year, or if he had personal estate of six thousand pounds, he was obliged to provide, equip, and pay, at his own charge, one horseman. If his income from land was fifty pounds, or if his personal estate was six hundred pounds in value, he was charged with the maintenance of a pikeman or musketeer. Persons not so well endowed with worldly goods were united into a society, each society being charged with the support of a soldier. It is probable that these bands of militia were uniformed according to the taste, pride, or penuriousness of those at whose expense they were maintained. The life of the soldier was of value to the person charged with him, for, in the event of his death, a new equipment would have to be purchased for the recruit who took his place. Those parts of the soldier's dress, therefore, that were intended for protection—like the helmet, the leather jerkin, and the breastplate—were undoubtedly provided, but the only uniformity that existed in the costumes of the men-at-arms was due to the fact that makers of accoutrements of the early day the world over had a very slender list of patterns. When fire-arms made metal armor useless, and the government undertook the charge of a standing army, officers and military tailors set themselves to the invention of new forms and to attractive combinations of color. It was late in the time of the Stuarts when all this happened, for the foot-soldiers of the army of Charles II. still carried pikes as well as muskets, and the dagger worn in a hanger or thrust into the muzzle was just beginning to develop into the bayonet.

It would be exceedingly interesting to trace the evolution of modern military uniforms from the armor of mediæval knights and men-at-arms, and the gradual development of what is now mere ornament from that which once was wholly utilitarian. The breast and back plates of the cuirassiers of Europe are the showy remnants of what was once the leather jerkin and subsequently the protective mail. The gorget worn by Washington had the same origin. The helmet of to-day is the natural descendant of the casque of the Middle Ages. The aiguillette, whose glittering loops and coils of gold now adorn mounted officers, used to be a cord and pencil for the writing of despatches. It is merely for show in these days, but at its end the form of the pencil is preserved. There is no doubt, I believe, concerning the origin of this particular bit of bravery, although there may be about the suggestion that epaulettes, wings, shoulder-knots and straps are the ornamental reminiscences of the plates, straps, and lacings which in olden times fastened together the front and back plates of armor. In the eighteenth century officers of the infantry still carried spontoons and half pikes, suggestions of the day when foot-soldiers were pikemen. The body sash, no longer worn in the United States Army, except by general officers, served a purpose generations before standing armies existed. When a warrior was sore wounded, and was prone on the ground in the midst of a fight, but was not yet killed or a prisoner, his comrades laid hold of the sash, and by means of it drew him out of the crowd. There is now no helmet designating rank by the quality or number of the bars of its bearer, but plumes and metal cap ornaments are insignia of rank and corps. We have no longer the shield which proclaimed with its coat-of-arms the identity of its owner; but we have the embroidered epaulette, or knot, or strap, each of which declares the rank of its wearer and the arm of the service to which he belongs. Uniforms developed very slowly, and many years elapsed before the comfort and convenience of the foot-soldiers were considered by those who designed and designated his clothes. His head covering is even yet a matter of apparently very little importance to those who are not obliged to stagger under the burdens which go to make up his necessary equipment. The helmet worn by our troops is neither handsome nor convenient, while the forage-cap is a mere pretence, so far as it is supposed to furnish any protection to its wearer.

The colors used in the uniforms of troops were probably first suggested by the colors and metals of heraldry. Therefore red and blue prevail, while yellow and white, representing gold and silver, are the usual facings. The other colors of heraldry, green and purple, are less frequently employed, and black, or sable, still less often. Modifications of color have naturally followed their introduction into the dress of troops, and the facings of regiments, which also may be said to have taken the place of the blazon on the knight's shield, are no longer limited to the colors of heraldry. We have, at least, the various shades of reds, blues, and yellows, and we do not follow the old rule of the blazoner, that metal may not go on metal and color on color. How our troops of the old French and Indian wars, and of the Revolution, came to adopt the colors of their uniforms is a difficult matter to determine. The theory has been advanced that we wore the blue of the English Whigs, of the Scotch Covenanters, and of the Dutch. It is true that blue, "true blue," was the color of the Covenanters of the Commonwealth and of the Whigs. It is also true that orange and its modification, buff, combined with blue, became distinctive regimental colors in honor of William III., whose Royal Artillery Regiment was clad in blue and buff, very like the uniform adopted by Washington for himself when he took command of the army at Cambridge. Buff and blue, however, were never the national colors. The facings of the uniforms of general officers were buff, and the color continued to be employed in the decoration of collars and cuffs of major and brigadier generals for several years after the close of the Revolutionary war, but there was no distinctive uniform for the American army that won the independence of the country. Several attempts were made by Washington and by Congress to secure uniformity of dress, but they were frustrated by the poverty of the colonies, and by the difficulty of importing cloth while the war was in progress. In 1775 our own textile

ıade on hand-looms, and it was in the linen unting shirts woven and put together by the ur troops were mostly clad when they were

ıy of the thirteen had its military force. The ne of the cities was well drilled and dressed. commands that fought in the colonial wars ench and Indians, paraded in honor of royal scorted the dignitaries to the Commencements College, and bore their part in the struggle an independence, are still in existence. The Foot Guards, of Hartford, Connecticut, not only this day, but continue to wear the scarlet coats, hats, and half-gaiters which originally composed orm. The City Troop of Philadelphia was with on, and its dress of to-day is a modification of that wore a hundred years ago. There are other mili- nizations in other cities, whose warrants or charters the Constitution or the battles of Lexington and . There was a good deal of military spirit in the . The necessities of a new country and the neigh- l of hostile Frenchmen and Indians compelled strict ent acts. In 1755 a volunteer militia regiment was in Pennsylvania, of which Franklin was colonel. all the inhabitants, except the Quakers, joined the which thus early excited the fears of the extreme sts in England, although it formed part of the perma- army in America, of which the Earl of Loudoun was ommander-in-chief. In Abercrombie's army, in 1758, Stark and Israel Putnam served with a force of 9000 incial troops. In this army appeared a body of men se like, afterward, always carried dismay to the hearts of ish regulars. They were "The New England Rangers." y wore the dress of woodmen, and were armed with chets in addition to their firelocks. Powder-horns were ng over their shoulders, and at their waists they carried ather bags filled with bullets. Pitt expected that New England and New York would capture Canada, and that the mid- e colonies would drive the French out of the Ohio Valley. The Virginia militia formed the best part of all the pro- ncial forces that co-operated with the regulars in the move- ents in the Ohio Valley. In this service Washington was st an adjutant of a district, then lieutenant-colonel, and en colonel and commander-in-chief of the forces of the col- y. His troops were ill-clad, and his own ideas of disci- ine were constantly thwarted by Governor Dinwiddie. niforms were not plentiful, and, at Winchester, he sug- sted the hunting dress, which he afterward advised for the volutionary troops. Uniforms had been so scarce that olonel Bouquet, of the regular army, expressed his delight th the new dress, writing: "We see nothing but shirts d blankets . . . Their dress should be one pattern for this pedition." It is evident that the use of the American rifle ess for troops originated in the French and Indian war, er Abercrombie had taken command of the army, and it had stirred the colonies to warlike activity.

As to Washington's own uniform at this time, the best thority is doubtless the portrait painted from life by C. Peale. There is no reason to suppose that, at this time, ashington had any sentimental reverence for the Whig nbination of buff and blue. His old friend Lord Fair- had been an officer in the Blues, and Peale represents his ject in a blue coat with red facings, and with red waist- it and breeches. This was then, and is now, the combi- lon of color in the uniform of the British and our own llery service. If Washington had any choice in the mat- of his militia uniform, it is probable that he was influ- ed by the dress of the independent cavalry company ich Fairfax maintained at Greenway Court. Sixteen rs after his resignation as an officer of the Virginia mili- he was a member of the Continental Congress, and one its military committee. After the news of Concord and cington reached Philadelphia, Washington appeared every in his place in Congress in uniform. John Adams, who ntions the fact in a letter to his wife, does not describe uniform, but it is reasonable to assume that it was the which he wore as a colonel of Virginia militia, and ich Peale painted. The buff and blue uniform that he re when he appeared at Cambridge was doubtless adopted r Congress appointed him commander-in-chief. He was ıctilious in the matter of rank designations, and it is likely t he selected the buff and blue as a designation for gen- l officers, and because of its marked contrast with the rlet uniforms of the enemy.

here is some confusion concerning Washington's uni- m. Col. Asa Bird Gardner, whose study of the history American uniforms has been most thorough, and who st be accepted as an authority on the subject, says that uniform of Washington's Virginia regiment was blue buff, and that "this was also the uniform of the '1st ned Associates' at Alexandria, of which he acted as col- l *ex officio* in 1775." With all deference to Colonel Gard- s authority in general, however, we must prefer that of le on this point. His portrait was painted from life in l at Mount Vernon, and there is no reason to doubt its absolute correctness in detail, except for the testimony of J. F. D. Smyth in his *Tour in America*. Smyth felt very bitterly against Washington, and apparently never saw him. His statement as to the color of the Virginia uniform, published nine years after the event in connection with which he mentions it, is not first-rate authority.

No sooner had the affairs at Concord and Lexington occurred than the provincial militia rose. In a letter to Mrs. Adams, written from Philadelphia June 10, 1775, John Adams says:

"Two days ago we saw a very wonderful phenomenon in this city: a field-day, on which three battalions of soldiers were reviewed, making full 2000 men—battalion men, light-infantry, grenadiers, riflemen, light-horse, artillerymen, with a fine train—all in uniforms, going through the manual of exercise and the manœuvres with remarkable dexterity."

The militia of the Middle States were generally clad in blue, with scarlet facings. They wore the cocked hat, or a small round felt hat turned up on one side and fastened with a cockade. Colonel Gardner, in his article on American Uniforms, mentions a New Jersey force of 1100 or 1200 men who, in 1758, were called the "Jersey Blues." They wore blue coats with red facings, gray stockings, and buckskin breeches. A number of the Massachusetts militia wore the red coat of the British service. In a print made in Boston in 1775, representing the fight at Lexington, the provincials are clad in coats of different colors; there are red coats, among others, in combination with buff waistcoats and breeches; while with the blue coats the small-clothes are red. The prevailing uniform in colonial New York was also blue and red. Some companies wore bear-skin caps; some wore green, with crimson facings; others green and buff. Most of the underclothes were white. The uniformed militia, however, were confined to the cities, where wealth and its displays were far from being unknown in the pre-revolutionary days. John Adams, in describing the party which attended Generals Washington, Lee, and Schuyler "a little way on their journey," when they started to go to the army at Cambridge, mentioned "all the delegates from the Massachusetts, with their servants and carriages; many others of the delegates from the Congress; a large troop of the light-horse in their uniforms; many officers of militia besides in theirs; music playing, etc., etc. Such is the pride and pomp of war."

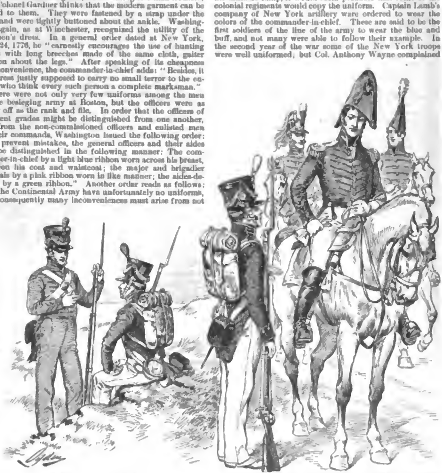
Whatever pride and pomp there was about the departure of the three generals from Philadelphia, and the field-day of the city's militia, there was very little to be found among the troops that were beleaguering Boston. There was never a more unsoldierly gathering than that which besieged the British Army, drove Gage to England in disgrace, and saw the fleet of Howe sail out of the harbor for New York. The New England men had very few uniforms. Here and there were militia companies, who soon wore out the regimentals of their colonial service. The first troops to march into camp, raised under the authority of the Continental Congress, were Morgan's riflemen. They came from Virginia, Maryland, and western Pennsylvania. Nearly all of them were clothed in white linen hunting shirts with furbelows at the wrists, elbows, shoulders, and around the neck. Whenever they appeared they caused a panic among the British troops, who had never met such marksmen, and whose smooth-bores were no match for the rifles of the woodsmen. When they emerged from the forests into Canada they were declared to be clothed in sheet-iron. The first Frenchmen who saw them announced that they were *vêtu en toile*, which, in the course of oral transmission, easily became *vêtu en tôle*. Captain Rawlings's company of Maryland Riflemen were clothed in green hunting shirts and leggings. These leggings, both white and green, were nothing less than trousers, and Colonel Gardner thinks that the modern garment can be traced to them. They were fastened by a strap under the foot, and were tightly buttoned about the ankle. Washington again, as at Winchester, recognized the utility of the riflemen's dress. In a general order dated at New York, July 24, 1776, he "earnestly encourages the use of hunting shirts with long breeches made of the same cloth, gaiter fashion about the legs." After speaking of its cheapness and convenience, the commander-in-chief adds: "Besides, it is a dress justly supposed to carry no small terror to the enemy, who think every such person a complete marksman."

There were not only very few uniforms among the men in the besieging army at Boston, but the officers were as badly off as the rank and file. In order that the officers of different grades might be distinguished from one another, and from the non-commissioned officers and enlisted men of their commands, Washington issued the following order: "To prevent mistakes, the general officers and their aides will be distinguished in the following manner: The commander-in-chief by a light blue ribbon worn across his breast, between his coat and waistcoat; the major and brigadier generals by a pink ribbon worn in like manner; the aides-de-camp by a green ribbon." Another order reads as follows: "As the Continental Army have unfortunately no uniforms, and consequently many inconveniences must arise from not being able to distinguish the commissioned officers from the privates, it is desired that some badges of distinction may be immediately provided, for instance, that the field-officers may have red or pink colored cockades in their hats, the captains yellow or buff, and the subalterns green. They are to furnish themselves accordingly. The sergeants may be distinguished by an epaulette or stripe of red cloth sewed upon their right shoulder; the corporals by one of green." One more order was necessary to complete the series. It provided that the major generals should be distinguished from the brigadier-generals by a purple instead of a pink ribbon.

These devices continued to mark the distinctions of rank, at least during the first years of the war. At the battles of Harlem and White Plains there were no uniforms. The officers still wore the colored cockades which Washington had prescribed, and by them alone were they distinguished from their men. Another mark of distinction at these fights was a white stripe worn on the arm by the riflemen. The pretty general adoption of Washington's suggestion, that as many of the troops as were not uniformed should procure hunting shirts, is shown by the fact, mentioned by Colonel Gardner, upon whose researches many of the statements in this article are based, that, at the battle of Long Island, many of the militia were clothed in hunting shirts of different colors, some in black, and others in yellow, green, or blue.

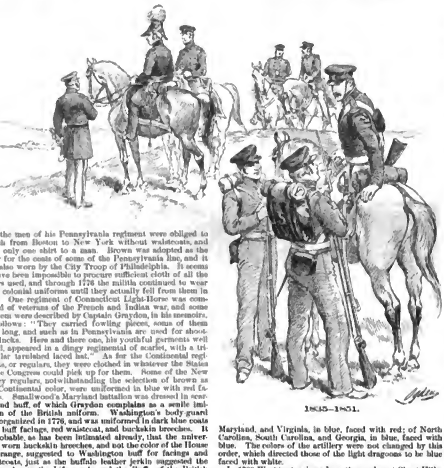
After the first year the army's need was not so much a question of uniforms as of clothes. Washington was continually begging for clothes, food, and ammunition for his troops. From the moment that he took command of the army until the close of the war he was in distress for supplies. At the very outset he found that his army had only nine rounds of ammunition, and Congress would not send him the powder that was absolutely necessary. All the provision that was made came from the colonies themselves. They raised the men, and were responsible for their pay, their clothing, and subsistence. Washington marched his men from Boston to New York, through the Jerseys, and to Yorktown. Often they were without shoes, sometimes without hats, or coats, or breeches. So destitute were they in New Jersey that the women of Philadelphia were begged to send to the army all the cast-off clothing they could find. It was a long time before the Continental Congress could be induced to authorize the enlistment of a standing army, and finally ended by giving Washington sole power in raising forces. Even then, it neglected to provide clothing and supplies for its regulars, who were as destitute as the militia of the colonies had been. In 1775 it enacted that the color of the uniform coats should be brown, and that the regiments should be designated by their facings and their buttons. It was also provided that the uniforms should be paid for by stoppages out of the men's pay. Brown, thereafter, became a prevailing color in the dress of the Continental Army. Buff underclothes were more common than those of any other color, mainly because most of the troops who were fortunate enough to have any substantial garments wore buckskin breeches. The independent companies of New York had gone into the war with their blue coats and red facings, the green of the Bold Foresters, and the silver-lace and gray and scarlet of the other commands. The Connecticut militia had worn out the scarlet coats which the government had on hand when the war began. The two colonies undertook to follow the direction of Congress, but New York only succeeded in procuring a lot of brown, gray, and blue cloth, which had been imported from Canada by an enterprising Albany merchant. The blue coats were faced with crimson, the brown with blue, and the gray with green.

Blue and buff being worn by the commander-in-chief and his aides-de-camp, it would seem probable that some of the colonial regiments would copy the uniform. Captain Lamb's company of New York artillery were ordered to wear the colors of the commander-in-chief. These are said to be the first soldiers of the line of the army to wear the blue and buff, and not many were able to follow their example. In the second year of the war some of the New York troops were well uniformed, but Col. Anthony Wayne complained



Rifle. Artillery Infantry. Dragoon. Major-General. Field-officer of Infantry.

1813–1821.



1835–1851.

that the men of his Pennsylvania regiment were obliged to march from Boston to New York without waistcoats, and with only one shirt to a man. Brown was adopted as the color for the coats of some of the Pennsylvania line, and it was also worn by the City Troop of Philadelphia. It seems to have been impossible to procure sufficient cloth of all the colors used, and through 1778 the militia continued to wear their colonial uniforms until they actually fell from them in rags. One regiment of Connecticut Light-Horse was composed of veterans of the French and Indian war, and some of them were described by Captain Graydon, in his memoirs, as follows: "They carried fowling pieces, some of them very long, and such as in Pennsylvania are used for shooting ducks. Here and there one, his youthful garments well saved, appeared in a dingy regimental of scarlet, with a triangular tarnished laced hat." As for the Continental regiments, or regulars, they were clothed in whatever the States or the Congress could pick up for them. Some of the New Jersey regulars, notwithstanding the selection of brown as the Continental color, were uniformed in blue with red facings. Smallwood's Maryland battalion was dressed in scarlet and buff, of which Graydon complains as a senile imitation of the British uniform. Washington's body-guard was organized in 1776, and was uniformed in dark blue coats with buff facings, red waistcoat, and buckskin breeches. It is probable, as has been intimated already, that the universally worn buckskin breeches, and not the color of the House of Orange, suggested to Washington buff for facings and waistcoats, just as the buffalo leather jerkin suggested the same color to the Lifeguards and the Buffs of the British Army many years before William and Mary ascended the English throne. Colonel Gardner gives the uniforms of the Pennsylvania regiments of the Continental line as follows: First Regiment, brown and buff; Second, blue and red; Third, brown and white, pewter buttons with "3" stamped upon them, black cocked hats with white tape binding, and buckskin breeches; Fourth and Fifth, blue and white; Sixth, blue and red. Some companies of the Virginia Light Dragoons, a Continental regiment, wore blue coats with red facings, and others were clad in brown coats with green facings. All wore leather breeches.

By 1777 uniforms were even scarcer than they had been during the first two years of the war. There was very little cloth to be had. Many of Washington's army wore the cast-off coats and breeches that had been sent to them in New Jersey by the women of Philadelphia. Colonel Anthony Wayne, of the Fourth Pennsylvania, whose uniform should have been blue and white, describes himself as "dressed in character for Mr. Heath or Captain Gibbes, in a dingy red coat and tarnished laced hat." General Gates is represented in a London engraving dressed in a red coat and buff facings. A uniform in all its details had been prescribed for the four regular artillery regiments. It was to consist of a blue or black coat, reaching to the knee, full lapels, "with ten open-worked button holes in yellow silk on each lappel (*sic*), and ten large regimental yellow buttons at equal distances on each side, three large yellow regimental buttons on each cuff, and a like number on each pocket-flap." The skirts were to hook back, in order that the red lining might be shown; and the lapels and cuffs were also to be red. The waistcoat and breeches were to be white, the half gaiters black, and the stock white. The shirts were to be ruffled, the hats cocked and bound with yellow. There were to be red plumes, black cockades, gilt-handled small swords, and gilt epaulettes. Congress and the States at last undertook to procure cloth for both officers and men, but their efforts were fruitless; and regulations of color and cut of coats, of ruffled shirts and gilt epaulettes, of white belts and stocks, must have appeared grimly humorous to the men at Valley Forge, who had neither breeches, shoes, stockings, nor blankets, and who, to perform their camp duties, borrowed the garments of their comrades, who went to bed until their turn came to go on guard, to dig in the trenches, or to fight. Most of the rank and file of the army to which Burgoyne surrendered were in the rags of what had been the working-dress of citizens, principally of farmers. And this was not the worst, for many of the troops were reduced to blankets and bed-coverings for coats, while the officers were clothed in motley, each one wearing a color and fashion not of his taste, but of his necessity. Although uniforms were the exception, both among the regulars and the militia, the variety of dress that had been adopted by the different States was wonderful. The artillery was pretty generally supposed to be clothed in blue and red, but the infantry wore all manner of facings with their blue, brown, and gray coats. Colonel Sumpter's South Carolina regiment wore red coats and black facings. Moylan's cavalry wore green coats faced with red, and round leather hats turned up with bear-skin. Some regiments had sky-blue coats and pale blue facings, supposed to be the origin of the light blue of our present uniform. The uniforms were prescribed, but they were largely imaginary.

Finally, in 1779, in anticipation of material aid from France, Congress authorized Washington to "fix and prescribe" the color, facings, and cut of the clothes to be worn by the troops. Accordingly the commander-in-chief issued an order at New Windsor, New York, in which he urged the soldiers to uniform themselves as follows. The regiments of New Hampshire, Massachusetts, Rhode Island, and Connecticut, in blue, faced with white; of New York and New Jersey, in blue, faced with buff; of Pennsylvania, Delaware, Maryland, and Virginia, in blue, faced with red; of North Carolina, South Carolina, and Georgia, in blue, faced with blue. The colors of the artillery were not changed by this order, which directed those of the light dragoons to be blue faced with white.

In 1780 Washington issued another order, at Short Hills, New Jersey, designating the uniforms for general officers and the staff. The major-generals were directed to wear blue coats with buff facings and linings, white or buff underclothes, two epaulettes with two stars on each, and a black and white feather in the hat. The uniform of the brigadier-generals was to be the same, with the exception that their rank should be designated by one star on each epaulette and the feather white. The stars were furnished at head-quarters; and they continue to distinguish the general officers of our army, precisely as was prescribed by Washington in 1780. The field-officers were ordered to wear two epaulettes, the captains one epaulette on the right shoulder, and the subalterns one on the left shoulder. The aides-de-camp were directed to wear the uniforms of their rank and corps, or, if they were not of any arm of the service, the colors of the grade of their general officers. Aides of a major or brigadier general were to wear green feathers, and those of Washington white and green. The feathers of the inspectors were to be blue. The order directed that the uniform of the engineers and sappers should be blue, buff facings, red linings, and buff underclothes. "All officers, as well warrant as commissioned, to wear a cockade and side arms, either a sword or a genteel bayonet." A few days later, Washington advised his officers to wear black and white cockades, typifying the union of France and America, the uniform of the French line being white.

The union of the armies was close at hand when Washington issued this order. His careful attention to details, and his insistence upon strict adherence to his prescriptions, showed that he was determined that his soldiers should appear as smart as possible when they were joined by their French allies. French aid was supposed to have opened to the Congress and the States the markets of Europe, and orders were sent abroad for the cloths and other articles necessary for the new uniforms. Lafayette had purchased the uniforms for the Division of Light-Infantry, and had presented the men with muskets and the officers with swords. This corps was composed of picked men from the infantry line. They were dressed in blue coats with white facings, white waistcoats and breeches, full black leggings, or spatterdashes, and round leather caps crested with horse-hair. They wore white crossed belts, and were almost exact counterparts of the French infantry of the line, except that their coats were blue instead of white. Notwithstanding the French alliance, however, cloth was obtained slowly and in small quantities, and, in 1783, Washington, in order that the regulation blue coats with red facings might be retained, notwithstanding the non-arrival of the cloth expected from Europe, ordered that the coats be turned and refaced with red cloth that would be furnished. The red, however, was also not forth-coming, and Washington then directed that the facings of the infantry coat be white. This order was never rescinded, so the facings remained white.

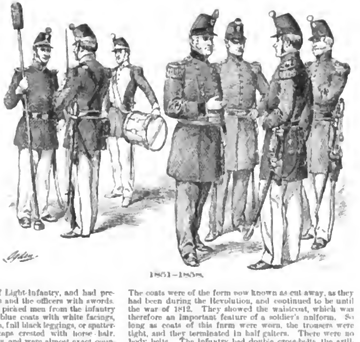
The Army of the Revolution was never properly clothed, and buff and blue were never the colors of its rank and file, with the exception of the prescribed uniform of the New York and New Jersey regiments, and of the engineers and sappers. They were made the colors of the general officers and the staff near the close of the war, and when Washington saw the opportunity and the occasion for maintaining the military rank and dignity consistent with the cause he served and with his own achievements and character.

From the close of the war of the Revolution until 1861 the uniform of the army has followed very closely the patterns of the French line. The few troops that remained in the service were organized into the "First American Regiment" of infantry, and two companies of artillery. The dress of the infantry regiment was blue, a coat with white facings and linings, white waistcoat and breeches, black cocked-hats, white shoulder-knots, silver epaulettes for officers, white cross-belts, black stocks, black gaiters, and black plumes. The artillery uniform remained blue with red facings, yellow worsted shoulder-knots, buff belts, and a red top to the black plume. These were the colors, reversed in the case of the infantry, of the French troops of the period.

The evolution of the uniform of the army of the United States accords mainly with the movement and development of French military fashions. In the Mexican war, and in 1861, the demand of active campaigns necessitated some modifications for the comfort and convenience of the troops in the field; and in 1881 we adopted the German helmet. The first substantial change in uniform, after the close of the Revolution, was in 1794, when the cavalry were ordered to wear helmets with white horse-hair plumes. Until 1810, the round leather hat of Lafayette's Light Guard was worn by American foot soldiers, and white was for a long time the distinguishing color of the infantry. The distinction was marked in every detail of the soldier's dress, not only in the color and metal of the epaulettes, but in the scabbards, the artillery wearing gilt, and the infantry steel scabbards. In 1796 both the infantry and artillery wore red facings, but the linings and buttons of the infantry uniforms continued to be white. In this year officers of infantry were authorized to wear boots instead of half-gaiters or spatterdashes. In 1794 the artillery adopted the French helmet. It was ornamented with a red plume.

For many years the company and regimental musicians wore red coats and blue waistcoats and trousers.

The colors of the uniforms of general officers had not changed: they remained blue and buff. Their long boots were lined with red, and so made that a little of the red was necessarily displayed. The commander-in-chief wore a white plume; a major-general black and white, and brigadier-generals red and white. At this time the infantry wore white pantaloons on occasions of parades and reviews, and on other occasions blue pantaloons edged with red. The difference between the artillery and the infantry dress consisted mainly in the color of the linings, not in the facings. The tight pantaloons, the black half-gaiter, were still in use, and continued to form part of the uniform for several years. The flank companies of the infantry were distinguished by white and red plumes, and of the artillery by black and red. Other changes were made by the order of 1799. The coat of the cavalry, early in the year green and white, was subsequently made green with black collar, cuffs, and lapels, the skirts turned up with black. The waistcoat was white, and the breeches of white leather. The cap was a leather helmet with a black horse-hair plume, which resembled a little more closely the helmet of the French cuirassiers. It was in 1802 that Jefferson ordered the French leather cap with a strip of bear skin on the top. Otherwise the changes in the uniform were not very great. By this time blue cloth had displaced buckskin leather or buff for winter pantaloons. White pantaloons were worn only in summer. The hat of the officers at this time was the immense *chapeau bras*. It was worn by general, field, and line officers. Artillery officers continued to wear gold epaulettes, and infantry officers silver.



1851–1858.

The coats were of the form now known as cut away, as they had been during the Revolution, and continued to be until the war of 1812. They showed the waistcoat, which was therefore an important feature of a soldier's uniform. So long as coats of this form were worn, the trousers were tight, and they terminated in half gaiters. There were no body belts. The infantry had double cross-belts, the artillery and cavalry single shoulder belts, to which hangers, swords, cartridge boxes, and bayonets were attached. The gorget, which was worn through the Revolution, the survivor of the breast-plate, disappeared, and an oval plate on the belt took its place.

The hair was tied up in cues, the length of which and the manner of arranging, it being minutely described in General Alexander Hamilton's order of 1799. But in 1801 Gen-

blue trousers were permitted in winter and white in summer. The medical staff was dressed in black. The two stars for the epaulettes of major-generals and the one star for brigadier-generals, which were prescribed by Washington in 1780, were ordered again in the regulations of 1813. High military boots, gilt spurs, were ordered. The general staff were directed to carry yellow-mounted sabres with black or yellow grip. The rest carried straight swords. Sashes went out for the first time, and black waist belts were worn by the staff, and by cavalry and artillery officers. The form of the buttons changed. They had been flat, now they were bullet-shaped. The coats were braided both on the breast and the skirts. The braiding on the skirts was in the herring-bone form. The buttons and loops of the artillery *chapeau* were yellow. The sword was what was known as "cut and thrust."

The light dragoons, for undress, wore a blue single-breasted coat, with one row of plated bullet buttons with straight blind hole. The stand-up collar, characteristic of the new coat, which was also closely buttoned, was worked with silver braid. The trousers were made, as they had always been, with a fall, and the fall of the dragoons' was worked with silk braid. Their full-dress consisted of a hussar jacket with three rows of plated bullet buttons. There was a wealth of blue silk braiding on the breast, collar, sleeves, and skirts of the coat. The vest was white, and the trousers, for parade, were white or buckskin. Dark blue trousers were worn for service. The dragoon boots covered the knee, and the spurs were white. The epaulettes were silver. The adjutant wore a white plume with a blue top, the quartermaster a green plume, the paymaster a blue plume and red top. The cloak was of the hussar pattern, with sleeves. Bars were used on the housings to denote the rank of troop officers—three for captains, two for lieutenants, and one for cornets. The holsters were bear-skin. Sergeants wore two white worsted epaulettes, and corporals one epaulette on the right shoulder. The dragoon armament consisted of pistols, sabres, steel scabbards, buff leather waist belt, white plate in front with the eagle in relief, and silver sword-knot.

In 1814 an order was issued taking the white lace and cords from the jackets of the officers and men.

The light artillery officers wore a coatee which was in form like the present dress coat of the West Point cadets. There were three rows of buttons, the button-holes being worked diagonally in blue twist. The collars were high, and ornamented with blind button-holes. The vest was white cassimere or doeskin for winter, and white jean or nankeen for summer. The trousers, white for parade, and dark blue for service. Hussar boots were worn. The cocked hat gave way to the black leather bell-crowned shako with visor, which had been adopted by the French. A gold band and tassel fell from the crown of the right side, and there was a gilt plate in front. The plumes were white, tipped with red. Epaulettes were worn as in the Revolutionary army. In this respect also we followed the French. The plumes of the quartermaster were green, and of the paymaster red. The bursings were red, and of the medical staff, blue. The armament consisted of sabres, gilt scabbards, black waist belt, a plate in front with eagle in relief, red sash, sabre suspended by a chain, cut-and-thrust swords, with black scabbards, for undress.

The undress coat was long, the skirts sloping from the hips. On social occasions, knee-breeches and shoes were permitted, and yellow knee-buckles were prescribed. Chapeaux bras without plumes were permitted. Non-commissioned officers wore yellow epaulettes.

The officers of the infantry dressed like those of the artillery, except that the sword was of sabre form, with silver or plated mountings. The epaulettes, buttons, spurs, and trimmings of the infantry were silver or plated.

A new uniform was adopted in the army at this time. It was the gray of the enlisted men of the riflemen. Colonel Gardner is of the opinion that the selection of this color was due to the difficulty of procuring blue cloth while the embargo lasted. The coat was short and single-breasted. The buttons were flat and yellow, and were ornamented with a bugle surrounded by stars, the number of the regiment being within the curve of the bugle. The blind button-holes, in herring-bone form, were worked in black, and the leather cap, ornamented like the buttons, bore a green pompon in front. Here, again, in the adoption of green for riflemen, we followed the French. Waistcoats and trousers were also gray. The officers wore artillery uniforms except in active service, when they dressed like their men. Most of the troops who fought in Canada wore the gray uniform, which was adopted in 1815 for the West Point cadets, in honor of the victories won in Canada, when the high silk hat was also prescribed.

In 1816 wings of gold bullion were authorized for officers of artillery and light infantry. The uniform of the ordnance corps was like that of the artillery, except that the buttons bore a significant device.

The army regulations of 1821 declare dark blue to be the national color. Chapeaux bras were ordered for all officers except company officers, who were directed to wear the bell-crown leather caps with gilt scales, yellow eagle in front, and the number of the regiment cut in the shield. A black cockade with a yellow button in the centre ornamented the cap. No plumes or pompons were worn with the chapeaux bras, but with the caps the artillery wore yellow pompons; the light artillery, white with red tops; the infantry, white; the light infantry companies, yellow; rifles, green. The artillery trimmings are all yellow, and those of the infantry white. The epaulettes and wings of the officers of the foot troops were silver.

A new rank mark was introduced at this time. Captains wore a chevron above the elbow on each arm; subalterns wore their chevrons below the elbow. Green jackets trimmed with black braid were ordered for the riflemen, and gray jackets with sleeves took the place of vests. Gray pantaloons were worn by the enlisted men of the artillery and infantry for winter service, and green for riflemen. Mounted officers wore high boots, and the enlisted men wore what from that time until recently were called "bootees," which were simply laced shoes a little higher than the old Jefferson shoe, which came two inches above the ankle. In these regulations the devices for buttons now in use in the army were prescribed. Officers were still advised that they might wear "white pantaloons or breeches with white silk stockings and shoes" on "unofficial occasions and in private societies."

In 1825 a cloth shako, or foraging cap, was introduced. It was blue trimmed with white lace. The colors of the pompons were changed in the following respects: light artillery, yellow with red tops; light infantry, white with red tops; grenadiers, red. The chevron was ordered for the non-commissioned officer this year. Sergeants wore one chevron above the elbow, and corporals one below the elbow. Uniforms were prescribed for the pay corps this year. In 1831 chaplains, commissaries, judge-advocates, and paymasters had no uniforms.

In 1833 the army returned to colored facings and trimmings, and some features of its uniform were then adopted that are to be seen to-day. General officers wore double-breasted coats with buff turn-backs, dark blue trousers with buff stripes, a buff sash. A cocked hat, such as General Scott continued to wear to the day of his retirement, much higher than the modern chapeau, ornamented with plumes, was prescribed. The major-general commanding wore three stars on his epaulettes; all other major-generals wore their coat buttons in threes, as they do at present, and had two stars; the buttons of brigadier-generals were ranged in twos, and the epaulette carried one star. The plume of the commanding general was a yellow swan feather; of other major-generals, black and white; of brigadier-generals, red and white; of adjutant-general, inspector general, aides-de-camp of the commanding general, yellow; of other staff officers, the color of their chief; of the quartermaster general, light blue; of subsistence department, half blue and half white.

The lining of the cloaks of general officers was buff. Red became the distinguishing color of the artillery. The coats had red edgings and turn-backs; the plumes were red cock feathers; the cloaks were lined with red; the trousers were

THE SPEAKER'S VICTORY.

THE Speaker of the House of Representatives has long been one of the most important of public officers. He appoints the committees of the House, which prepare all legislation, and the House generally follows the committees. It is thus largely in the power of the Speaker to control legislation. Under the old rules of procedure, however, the minority could delay and even baffle the action of the House, and some method of restraining filibustering was unquestionably necessary. But the Republican majority, under Mr. REED's leadership, has adopted rules which greatly increase the power of the Speaker, and make him a still more important figure in the government. This is done by depriving the minority of a power which the Republican minority has always justly claimed to be of the highest conservative value—the power of imperatively calling the attention of the country to proposed acts of the political majority

THE disposition and the ability of the people to restrain themselves are the vindication of popular government. In other words, it is the moderation, not the inflammation, of party spirit which is the security of such a government. It used to be accepted almost as a truism that popular governments inevitably perished by the madness and fury of factions, and the Roman proscriptions and the civil contests of the so-called mediæval republics were cited as awful warnings. But the history of the American republic traverses this tradition. It is especially interesting as an illustration of peaceful popular acquiescence in the will of the majority lawfully expressed. Obedience to law is the distinction and the security of the republic. This is due largely to the temperament of the dominant race in the country, to its traditions, and to its training. These have given us the disposition and the power to restrain ourselves. It follows that the tendency to magnify and intensify party spirit is one that patriotism will vigorously oppose, because such a tendency involves the destruction of our chief political safeguard.

The assertion of party organs and orators that our government is one of party, that therefore every citizen ought to be a partisan, and the more completely partisan the better, is a great mistake. The very reverse of this proposition is the truth. The more effectively a man restrains his party spirit the better citizen is he, and the more wisely he serves the country. No man ought to be a partisan in the sense in which the assertions about party are generally made. A party is properly an agency: it is a convenient form of association and action to obtain certain results; but its transformation into a continuing organization to be supported for its own sake, which is the theory of ardent partisans, is both ridiculous and dangerous. It was this conviction which led Mr. GREELEY to say that parties ought to be reconstructed every few years, and the will and power practically to oppose the tendency to magnify party are the conservative forces of popular government. This is the source of interest of the late contest about the World's Fair in New York. Party spirit, or what is familiarly called politics, suddenly intervened, and

all reforms aiming at honester political methods—a spirit which is unquestionably powerful—has hitherto prevented the passage of the reform bill. In doing this he opposes a very strong and increasing feeling in his own party, and he must foresee that his party would not dare, in a national platform, to pronounce against ballot reform, or even to omit to declare its approval of it. He is playing a dangerous game for himself, unless he is persuaded that the controlling sentiment of his party is really hostile to the reform, or unless he is desperately conscious that its best sentiment approves it, and for that reason would reject him as the party candidate.

There can be no doubt of the passage of the bill by the Republican Legislature, and no doubt, also, of the great benefit to honest elections if it should become law. The prompt and general demand of ballot reform, and its complete success wherever applied, are very suggestive facts for every shrewd politician. The Governor undoubtedly sees in its support by Mr. PLATT and his State Committee reason to believe that it must somehow benefit the Republican party, because otherwise the PLATT power would not favor it. The tone of the Governor's friends in the press shows that the objection will be raised that the reform disfranchises illiterate voters. This point, however, has been foreseen, and due provision made to secure the casting of such ballots according to the will of the voter. The illiterate voter must in any case be aided, and the law secures honest aid for him. The dishonest manipulation of such voters is one of the chief and most familiar corruptions of elections, and it is one of the notorious wrongs upon honest voters which the law is intended to correct. Moreover, in a community which taxes itself enormously to provide free education for every citizen, illiteracy cannot be justly urged as a bar against equitable measures for securing honest elections. The general registry which has been proposed is a good scheme, but it has nothing whatever to do with the ballot law. The registry records the right to vote; the reformed ballot law prescribes the method of voting. If the Democratic representatives in the Legislature generally sustain Governor HILL in opposing the SAXTON bill, to a community for fabulous wealth, for the happiness of its people, and their increase in intelligence is now offered," while he playfully disposed of Mr. Platt's theory of the Tammany drift of the Commission by remarking that it was of a kind to make a brass monkey get up on his hind legs and laugh his head off.

But it is probably "Tom Platt" who laughs last. He said that there was a Tammany majority on the Commission, and it must be annulled by adding twenty-two Republican names. "Oh no," said the other side, "there is no Tammany majority whatever, but let us annul it by requiring a two-thirds vote." "All right," said "Tom"; "I agree, for that annuls the Tammany majority." Thereupon three cheers for the Honorable Thomas C. Platt shook the circumambient air. Everybody claimed the victory. "Traitors," "assassins," "Judas Iscariots," "Benedict Arnolds," "renegades," and "enemies of the Fair" fell to mutual embracing, and all made one happy family. Once more the Great Four are cutting pigeon wings of harmony, and as the curtain descends on the good old comedy, they advance to the foot-lights, tripping in time, and singing, gayly,

"On with the dance; let joy be unconfined."

PARNELLISM AND CRIME.

The report of the Parnell Commission is an important document, with which, according to the London correspondents, both sides seem to be satisfied. The direct criminal complicity, as charged by the *Times* in its articles upon "Parnellism and Crime," is denied. But an encouragement of methods which led to crime is affirmed, and forty-four members of the House are found guilty, in this sense, of criminal conspiracy. They countenanced boycotting and intimidation.

This, however, is a refinement which will be lost practically upon the British mind. If the distinct criminal charges against Mr. Parnell are unfounded, Mr. Parnell is a better man than we took him for. This will be the general conclusion. For any man who warmly supports a cause may be in a certain sense held to be responsible for acts done to advance it. The New York Whigs and Tories of the Revolution were classed respectively as friends of Skinners and Cow-boys. The supporters of the Land League, in the same way, promoted boycotting and the wrongs which resulted from it. In finding the Irish members named guilty of criminal conspiracy the Commission embarrasses the government more than the members or the country, which will regard the phrase as Pickwickian.

The report is undoubtedly an impartial judgment of the situation, and as such it must be interpreted as favorable to Mr. Parnell and his friends. The real charge was that they were engaged in a conspiracy to separate Ireland from England, and were practically accessory to crimes to promote that object. This charge has failed wholly, and the Irish members appear as engaged in a lawful scheme for what they hold to be for the benefit of their country, and in the pursuit of that object many excesses have been committed and laws have been resisted. The vague background of criminal suspicion against which the Home Rulers stood, to their immense disadvantage, has vanished. They may be unwise, and many of their followers may be lawless, but they are fighting a legitimate constitutional battle. This must be considered to be the verdict, and it cannot but be considered a great victory for Mr. Parnell and his friends.

FROM SANTA FE.

Here is a Santa Fe view of ballot reform:

"The Australian system is good just this far—it makes every voter *independent*. Let's have it by all means. But the idea that secrecy will stop vote-buying seems more than doubtful. The chances that a floater will take a bribe, and then break his word and vote the other way, are about one in a hundred. Does the floater wish to see his 'occupation gone'? Not quite. Is there no honor among thieves? Will the doubtful but wealthy candidate save his money, and let slip a 9-10 or even a 1-2 chance that his floaters will vote as they agree? Not by one hundred years more of dilly-dallying with the question. Why not add a clincher to the Australian system by taking all penalty from the vote-seller, and making it no less than five years in the penitentiary to buy a vote? That would make the business dangerous—positively dangerous—and give detectives a chance. So long as buyer and seller are equally punishable, they protect each other.

"But we can't do it. Why? Just this:

"There are enough political hogs in both parties who don't want reform to block all progress."

Our correspondent must not lose heart. Experience shows that there are not enough "political hogs" in both parties to defeat any reform which the public conviction really demands. In such cases the "hogs" may root, but they must die.

MR. DOUGLAS ON ABRAHAM LINCOLN.

The speech of Mr. Douglas, the son of Mr. Lincoln's old rival and opponent, at the late dinner in Brooklyn on Lincoln's birthday was very interesting. He said that there is a general tendency to extol Mr. Lincoln's tenderness and gentleness and childlikeness, in practical disregard of the positive, practical, masterful qualities which made him a true leader of men. Mr. Douglas regards him as the clearest-headed and shrewdest, as well as the cleanest-handed and purest, of American politicians; or, as we should prefer to say, public men; for the word politician, however good a word, has come to be used in a sense which fits many men, but not Mr. Lincoln.

This view is fully justified by the Hay and Nicolay life of Mr. Lincoln, and by that of Mr. Herndon. The revelations made by his secretaries of Mr. Lincoln's command of his cabinet and administration, of his tranquil but absolute self-reliance, of his extraordinary ability in affairs of which he might be supposed to have been practically ignorant, his singular tact in dealing with men, and of his marvellous diplomatic instinct, as illustrated in his correction of Mr. Seward's despatches, are as surprising as they are agreeable.

Such facts are as pleasant as the details of the ability and wisdom of Washington to one who has taken only the mythological view of him. The goodness of both men is obvious. It is their greatness which with the lapse of time is constantly more striking. The successful leadership of colonies in active revolution requires something more than goodness and tenderness and sweetness, and the wise conduct of a great country convulsed with civil war, under the conditions of our contest, demands the greatest and noblest human qualities. This truth was recalled and illustrated admirably by the son of Mr. Douglas in speaking of Mr. Lincoln.

THE PENDING COPYRIGHT BILL.

There seems to be little reason to doubt that the Senate, which last year passed the copyright bill, is as friendly to the measure, or even more friendly, this year. The Judiciary Committee of the House has unanimously agreed to report an international bill, which is substantially the Chace-Breckenridge bill, and the House Committee on Patents has already reported favorably a similar bill. As the bills are not materially different, if the favorable reports are honest, final agreement may be assumed, and the passage of a compromise bill. But the ways of Congress temper the ardor of anticipation, and the progress of the measure must be watched closely.

The recognition of an author's moral property right in his production, and the necessity of considering both vested interests and the fundamental law, have produced the bill known as the Chace, or Chace-Breckenridge bill. This is supported by authors, publishers, and the various branches of book manufacture. It is the first and only bill which has united that support, and the union, of course, is due to mutual concessions. The plea against the bill is practically one of confiscation. It calls itself a plea for cheap literature, but it really urges cheapness at any cost.

In fact, as is shown by the testimony of the most sagacious experts, the cost of no class of books would be affected by the bill, except possibly future novels. The logic of the adverse argument would abolish all copyright, domestic as well as foreign. But if the public welfare is to be the final consideration, it is undeniable that the confiscation of any rights instinctively recognized by a just public sentiment is an injury to the public welfare whether it makes books cheaper or dearer.

THE NEW YORK CAPITOL.

The New York Capitol has already cost more than four times its contemplated cost, and a sum equal to that originally contemplated is necessary to complete it. The sum first mentioned was $4,000,000. The outlay thus far has been, according to the report of the Comptroller, $18,260,255.23, and undoubtedly $4,000,000 more would be necessary to complete it properly. The project first took form in the Constitutional Convention twenty-three years ago, and the narrative of the progress of the work is not a pleasing tale for the pride or the purse of New York.

It is, however, in many ways a noble building. Except the Capitol at Washington, there is no public building in the country so impressive. Certain parts, like the chamber of the Court of Appeals and the stately Library, are unequalled. That there have been monstrous carelessness and jobbery, however, during the course of the work the exposure of the ceiling scandal showed, and that under private auspices the building would have been finished long ago, no less substantially and very much more cheaply, is unquestionable.

But there can be no doubt that it should be pushed to completion as rapidly as possible. If the people of the State could be polled upon the question they would not decree that the Capitol should remain unfinished. They would, however, undoubtedly demand to know exactly what needs yet to be done, and what the estimated cost may be. Politics and jobbery are the Gog and Magog of public buildings, and it is only with labor and pains that the public work gets done. But labor and pains can ascertain what is necessary to complete the Capitol, and the same good genii can then complete it.

KNICKERBOCKER "WORTHIES."

The loiterer who admires Union Square and Gramercy Park and Madison Square—pleasant parks amid busy streets—naturally rejoices that there was an intelligent public spirit which would not suffer those open spaces to be obliterated by the encroaching city. But a recent paper in the *Tribune* reminds us of the pertinence of the cadi's question, "Who is she?" Every great movement is apt to resolve itself largely into the heroic tenacity of one man or woman whose name historically represents it, as Romilly the reform of the penal laws in England, or Garrison the abolition of slavery in the United States, or Florence Nightingale the sanitary care of an army. Such men and women do not accomplish results alone, but when known they typify the result to the public mind.

We say when known, because it is often necessary to ask the cadi's question. Here is a result, but who mainly achieved it? Union Square, within the memory of men living, was a waste and neglected ground. But a citizen of great public spirit and mental grasp, whose official reports upon internal improvements and the Erie Canal are of very great value, and whose figure was familiar until within a few years, Samuel B. Ruggles, was the real founder of Union Square as we know it, and a bust of him might well be placed there. He also gave the area of Gramercy Park to the owners of sixty adjoining lots, on condition that they would build fine houses around it. Mr. Ruggles must be ranked among the "worthies" of the city.

In a similar way Madison Square, a delightful pleasure-ground, the city mainly owes to James Harper, who was Mayor of New York forty-six years ago. The land had been a Potter's Field, and was partly covered with a pond. The city authorities proposed to build upon it a House of Refuge, but Mr. Harper rescued it and saved it for the public ground which is a great ornament of the city. It is pleasant to associate such pleasant spots with eminent citizens, and to be reminded that it is just such individual perception and persistence, which show and lead the way, that secure great public benefits.

PERSONAL.

Among the earliest lecturers on Russian Nihilism in this country was John Baker, now of Boston, an escaped Siberian exile, who carries the marks of the knout on his back. His father was beheaded in the latter part of the '50s for participation in a Polish insurrection, and he, his mother, sisters, and sweetheart were packed off to Siberia by different routes. The band of exiles which included Baker rose against their guards while on their way to Siberia. Some of the prisoners were shot down and others escaped, Baker being among the latter. He came to this country near the opening of the war, entered the Union army, and fought with the boys in blue till peace was restored. Then he joined the regular army, and saw service on the frontier. The loss of a hand by an accident forced his discharge, and he has since been engaged in literary and other pursuits. Now he is married to an American lady, and lives in Boston, where he holds some government position. When Mr. Baker first told in this country his story of Russian cruelty and oppression, it was pronounced untruthful and greatly overdrawn by George Kennan, who had been to the land of the Muscovite, but only had a surface glimpse of its institutions and government. Since his later investigations Mr. Kennan has materially changed his views. Mr. Baker's name is of course assumed, and he preserves his homely pseudonym out of regard for his friends in Siberia and in Russian Poland, for he, like other exiles, is active in secret work which it is hoped may some time bring peace and light to his native land.

—The late Empress Augusta maintained a strict dietary for many years before her death. Her first meal of the day was a cup of cocoa or of strong tea, taken early in the morning, and this was followed at 11 A.M. by a large cup of bouillon. About two o'clock she ate her principal meal, consisting usually of a small piece of fowl, a few vegetables, and a glass of wine and water, while her supper consisted only of an ice, a slice of cake, and a cup of tea. Among other anecdotes now circulated concerning the Empress is the one that during the Berlin riots of 1848 she disguised herself in the uniform of a lieutenant of artillery, and carried some valuable papers she could confide to no one else from the residence of the Prince of Prussia to the royal palace. The Empress is said to have left a fortune of over ten million marks. The Grand Duchess of Baden inherits half of this sum, and all of the Empress's jewels.

—Solomon Sulzer, the reformer of the Jewish liturgy, and composer of most of the ritual music used everywhere by the reformed Jews, died recently at Vienna at the age of eighty-six. He had been chief cantor in the synagogue of that city for the past sixty years.

—Beethoven's musical instruments have been exciting a good deal of public interest lately. A Guarnerius violin, supposed to be his on the strength of the initials L. v. B. scratched upon it, has recently been proved spurious; but the last piano used by him, made expressly for him by Conrad Graff, and declared by competent judges to be genuine, has just been secured by the Beethoven Society of Bonn.

—Greene's celebrated "Ride to Khiva" is to be outdone by a Cossack officer named Pyevtzoff. Mounted on a cavalry horse, and carrying his provisions with him, he started alone from Blagovetchensk, on the river Amoor, in November. He expects to reach St. Petersburg in April, having made the longest ride on record, a distance of 5300 miles. When met near Irkutsk he had made about a quarter of the distance, and was in excellent health and spirits.

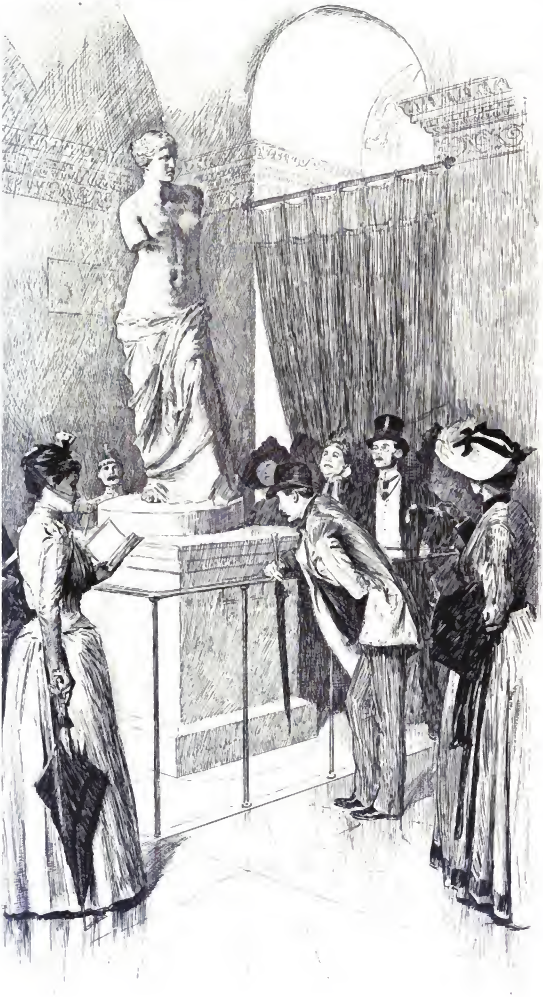
—Señor Castelar, the great Spanish republican, has recently brought himself into ill odor among his own party by the display of his personal esteem for Queen Christina and his solicitude during the illness of the baby King. His gallantry in making inquiries concerning his illness has been construed into disloyalty to his principles. His regard for the Queen dates back to the loss of his sister, to whom he was deeply attached, and at whose death the Queen sent many kind expressions of sympathy. This bereavement is said to have altered Castelar's whole nature, converting him into a melancholy, reserved man.

—Dwight L. Moody, the well-known evangelist, is growing gray and portly in these later years of his useful life, but his aptness of metaphor and the force with which he is in the habit of driving home unpalatable truths have not diminished. He seems to work just as hard as ever, too, and his schools at Northfield, Massachusetts, and his mission at Chicago do not keep him from filling appointments for longer or shorter periods in different parts of the country.

—A laboratory for the free treatment of patients suffering from hydrophobia is soon to be opened at 178 East Tenth Street, in this city, by Dr. Paul Gibier, a professor of pathology at the Paris Museum of Natural History, and a collaborator of Pasteur and other distinguished scientists. He is one of the greatest of experts in hydrophobia, and has also made especial studies of the yellow-fever and cholera. His laboratory here will be patterned after the one in Paris.

—Miss Susanna Warfield, who composed the grand inaugural march which was rendered at the inauguration of President William Henry Harrison forty-eight years ago, has just died at her home near Sykesville, Maryland. She was ninety-five years old.

—Miss Susan B. Anthony celebrated her seventieth birthday at Washington in a characteristic manner the other day. After holding an all-day reception, during which many friends called upon her to express their congratulations, she attended a banquet given in her honor, where about two hundred and fifty people sat down. Miss Anthony escorted Senator Blair to dinner and placed him at her right, while Dr. Robert Purvis, of Pennsylvania, a colored man, sat at her left. The tables were prettily decorated with flowers, and there were many good things to eat. After the feasting there were poems and responses to toasts, among those who contributed being Phœbe Couzins, Harriet Hosmer, Rev. Anna H. Shaw, Elizabeth Cady Stanton, Isabella Beecher Hooker, Mary Wright Sewell, Laura Ormiston Chant, of England, and Miss Anthony herself. Miss Anthony wore a trained gown of garnet, with lace at the neck and shoulders, and looked as bright and happy as the occasion required.



NG ABROAD—THE VENUS OF MILO, IN THE LOUVRE.—Drawn by C. S. Reinhart.—[See Page 163.]

this our satisfaction was short-lived, for the Priest Captain quickly ordered the officer to relieve us of them, and of our cartridge belts as well. Nor was it until we had been thus entirely disarmed that he arose from his undignified position and resumed his seat upon the throne.

While the disagreeable process of disarming us was going on I spoke to Fray Antonio of the curious possibilities suggested by the knowledge of fire-arms which the Priest Captain, alone among all the Aztlanecas, so obviously possessed; and he in reply, bade me remember what Tizoc had told us of the use that Itzacoatl made of wax matches in lighting the sacred fire. "Can it possibly be, then, that he is in communication with the outside world?" I exclaimed.

As I uttered these words I glanced at Itzacoatl, and the expression on his face was that of one who listens intently and who is greatly enraged by what he hears. At the same moment Rayburn cried: "That man understands Spanish. He is listening to you!"

Doubtless some sort of an explanation would have followed this strange discovery, for that we had made it was very obvious, but at that moment a man—seemingly, from his dress, a priest of high rank—came into the hall hurriedly and very earnestly delivered a communication to Itzacoatl in low, excited tones. That the substance of this communication was highly disagreeable to him was shown by his manner of receiving it; and for a moment he slightly hesitated, as though very grave consequences might attend upon the decision that he then made. But it was for a moment only that he stood in doubt. Then he called the barge-master to him and gave some order in a low voice, and then, accompanied by the priest, went out rapidly from the hall.

Evidently in obedience to the order that he had received, the barge-master bade us follow him, and so led us into the court-yard again. Young proposed, since we had only this one man to deal with, that we should make short work of him and so get back our arms—which remained where he had placed them, in a pile beside the throne. But Rayburn's more prudent counsel overcame this tempting proposition. As he pointed out, the promptness with which the curtains had been pulled back showed that attendants of some sort were close at hand; and in addition to these we knew that the guard of soldiers was just outside of the entrance to the hall. It was certain, therefore, that we could not regain our arms without immediately using them in very active fighting—and, no matter how well we fought, under these conditions we must certainly be defeated in the end. All of which was so just and so reasonable that Young could not in any wise gainsay its propriety; but he was in a very ill humor at being restrained from the pleasure of "havin' it out with 'em," as he grumblingly declared, and as we passed forth into the court-yard he relieved his mind by swearing most vigorously.

For my part, even the peril that we were in did not suffice to distract my mind from curious consideration of the strange state of affairs that existed among the folk dwelling in this hidden valley if our surmise in regard to the Priest Captain's knowledge of the outer world should prove to be well-founded—and unless it were well-founded there seemed to be no possible way by which to account for his possession of friction matches, his acquaintance with fire-arms, and his knowledge of the Spanish tongue. The implication was unavoidable that this extraordinary man actually had a more or less complete knowledge of the powers and appliances of the nineteenth century; and that he was using his nineteenth century knowledge to maintain his supremacy over a people whose civilization was about on a par with that of European communities of a thousand years ago. From the stand-point of the ethnologist a more interesting situation than the one thus developed could not possibly be devised. What I most longed for was the establishment of such friendly relations with Itzacoatl that I could carry out a systematized series of scientific investigations among the Aztlanecas before the impending crash of discovery came, and my keenest regret at that moment was caused by the conviction that the incapacity of Itzacoatl to understand the value of scientific inquiry into such curious ethnologic facts would result in his mere vulgar killing of me—whereby a precious store of knowledge would be withheld from the world at large.

As we came out into the court-yard we heard the sound of voices, which seemed to be raised in angry altercation, coming from the direction of the main entrance, with which there was also a slight clinking sound, as of arms being got in readiness, and, much further away, the sound seemingly coming from a distant quarter of the city, the tapping of a drum. When we first had crossed the court-yard it had been entirely deserted, but now many priests and soldiers were standing in groups about it, and more were coming down the stair from the temple; and all of these men had a look of eager alertness, as though some decisive event were imminent in which they expected to have a part. But we had only a moment in which to observe all this, for we were hurried away toward the corner of the building that was most remote from the street, and here, before I well could understand what was being done with me, I was thrust so suddenly and I fell heavily upon the floor. Before I could regain my feet, Young had tumbled down on top of me, and then the others tumbled on top of us both—they having been in the same rude fashion injected in the apartment; and while we thus were lying in a heap together—my own body, being undermost, having the breath wellnigh squeezed out of it—we heard the rattle of metal upon stone as the doorway was quickly closed with heavy bars.

We struggled to our feet in nearly total darkness—for outside the bars a curtain had been dropped that shut off almost wholly the light of day—and I am confident that no one room ever contained two angrier people than Rayburn and Young were then; for their very strength and hardihood made them the more ragingly resent being thus tumbled about as though they were bales or boxes rather than men. Rayburn's language was not open to the charge of weakness, but the words in which Young gave vent to his feelings were so startlingly vigorous that even a Wyoming cow-boy would have been surprised by them; yet I must confess that at the moment—so greatly was my own anger aroused—I thought his observations exceedingly appropriate to the occasion that called them forth, and I even was disposed to envy him the command of a technical vocabulary that enabled him to express so adequately his righteous wrath. However, I was for once well pleased that Fray Antonio did not understand English.

But our anger quickly was swallowed up in anxious grief as we discovered, when our eyes had become somewhat accustomed to the very faint light, that only we four were in the room together, and a great dread fell upon us because of the imminent peril to Pablo which this separation of him from the rest of us implied. Assuredly, there was strong reason why he should be an especial object of Itzacoatl's fear and hatred. He and El Sabio together were the visible sign which told that the prophecy touching the Priest Captain's downfall was about to be fulfilled; and, more than this, Pablo's simple statement of the condition of affairs among the modern Mexicans—showing that the crisis in their fate that Chalchiuitzin had foretold, and for which he had so well prepared, long since had come and gone—would be far more convincing to the masses of the Aztlanecas than would be any exhibition of these same facts that we could make to them; for we were aliens among them, while Pablo was of their own race and class. That we all were like to be done to death by this barbarous theocrat we did not for a moment doubt; but it was plain enough that every motive of self-interest must prompt him to put Pablo and the poor ass most summarily out of the way. And as the logic of these facts irresistibly presented itself in my mind, a keen and heavy sorrow overcame me: for I could not shirk the conviction that, whoever might strike the blow that killed him, I myself was the cause of this poor boy's death. Fray Antonio could not see my face in that shadowy prison; yet his fine nature divined the pain that I suffered and the cause of it, and he sought to comfort me with his sympathy. He did not speak, but he came close beside me and tenderly laid his hand upon my shoulder; and his loving touch, telling of his sorrow for me and with me, did bring a little cheer into my heavy heart.

Meanwhile the commotion outside increased greatly, and even through the thick folds of the curtain we could hear plainly the clanking of arms, and the heavy tread of men, and sharply given words of command. We pressed close to the bars and tried to push the curtain aside that we might see out into the court-yard, but the bars were so near together that our hands would not pass between them, and we therefore could gather only from the sounds which we heard what was going on outside. But the sounds were unmistakable. There could be no doubt whatever that a vigorous assault upon the building was in progress, and that those within it vigorously were defending it; and we knew that the cause of the fighting certainly must be ourselves. Already, it would seem, the prophecy of the Priest Captain's downfall was assuming a tangible reality; for this rising in arms against him could mean nothing less than that his high-handed refusal to permit us to be carried before the Council of the Twenty Lords had fairly brought matters to a crisis, and that the long-threatened revolution actually had been begun.

[TO BE CONTINUED.]

SIGHT-SEEING ABROAD.

THE VENUS OF MILO.

"I HAD not been ten minutes in the place before I fell in love with the most beautiful creature the world had ever seen. She was standing, silent and majestic, in the centre of one of the rooms of the statue gallery, and the very first glimpse of her struck one breathless with the sense of beauty. . . . She may be two-and-thirty, and she was born about two thousand years ago." So wrote Clive Newcome to Pendennis from Paris in 18—. The place was the Louvre; "the creature silent and majestic," the Venus of Milo.

To-day the Venus of Milo has changed somewhat her position, and this in a double sense. As Thackeray saw her she was in the

s, superb,

majestic, at one end of a gallery, and her only rival, the Venus of Vienne, is in place at the other end. Her pose was more perpendicular in Clive's time than it is now. When, during the war with Germany, Paris was besieged, and there was the chance that a shell might shatter the greatest statue in the world—which is this Venus of Milo—she was buried. When she was exhumed, and a careful study made of the base on which she stood, it became evident that the position as the sculptor had willed it should give her more of an inclination to one side, and so she stands to-day, and, if it were possible, with increase of dignity.

This statue has made an epoch in art, purifying and elevating it. Modern reproductions in bronze and plaster are found all over the United States; for of the works made by human hands she alone fills every artistic requirement. Rescued from partial oblivion sixty-nine years ago, it is not likely that she will ever be again lost to the world.

Speculations as to whether she stood alone or formed one of a group need not be here discussed, nor is it worth while to argue whether in the hand which once existed an apple or a shield was held. As she stands, armless, she is sufficient, and her mutilation is barely appreciated.

Mr. Reinhart, in his happy sketch, draws his scene in unison with the effect this statue imposes on those who look at her. Sight-seers, with guide-books in their hands, may refresh their minds with a name, a date; but the printed page serves but for the instant, and then the greatest work of art rivets their attention. Perhaps the feeling of astonishment is the one least developed in those who see the Venus of Milo for the first time. Awe there is, with some undefined emotion akin to reverence. The young man near the railing is absorbed. He feels the grandeur of that woman the old Greek has made. Right back of him, separated by the width of the pedestal and the rail, there is the head of a young woman, thrown in apparently by the artist without much premeditation, but which shows Mr. Reinhart's cleverness. It is a little face lost in admiration, for the girl tries at a single glance to take in the whole of the august figure. The woman with the book, whose own pose is so perfect, will have impressed on that thoughtful brain of hers a remembrance of her Greek sister which will never be forgotten.

MAKING A LANDING BY SEARCH-LIGHT ON THE MISSISSIPPI RIVER.

NOT sometimes but always recent discoveries in science or their applications are used first as common conveniences before they are adopted for military or naval purposes. Electric motors and storage batteries will be thoroughly tested by various transportation companies, the advantages or disadvantages studied and compared with other methods of creating power, before they will be taken into general use by the navy. The search-light, which is so important as a means of defence for a ship of war, was long in use by the merchant steamer before it was taken by the navies of the world.

The point has been disputed whether the use of the search-light on the ocean steamer was not anticipated by the Mississippi steamer. As to the conveniences derivable from the search-light for a steamer on the great river they are conspicuous. The craft that travel up and down the Father of Waters are peripatetic—this to be understood in the sense that though there be regular landings, there are many which are not. Some of these boats are of the most accommodating kind, and will, if the river permits of it, stop, and take on or let off a single passenger, and will pick up freight all along the long route.

It is the necessities of landing which call into use the search-light, and electric illumination for this purpose is likely to be much increased. The people on the land do not always know when the steam-boat intends hauling into their shore. Conveniences such as of docks or wharves are not common. The loud whistle is often the first announcement at night of the arrival of the steam-boat. It would be impossible to make a landing of a dark night without the search-light. In an instant the carbon pencils, brought up to the highest state of incandescence by means of the interrupted electric fluid, have their intensity focused by a mirror on one exact point, and a brilliant gleam of light streams across the horizon. The light, as it were, drills its way through the murky gloom. The houses on the shore, the low wharf, the coal or the wood shed, the thickets of trees in the background, are held in the glare of the electric beams. The mimic sun sends forth its radiations. It is not as much the whistle that wakes up the ears of "the Coast," as it is their eyes. There is nothing that startles a sleeping man so strangely as an electric light thrown suddenly on him. Then the town bestirs itself, and, just as Mr. Graham has drawn it, the fifty or a hundred people rush down to the water-side.

The search-light is under charge of the pilot. A simple mechanism makes the connection between the dynamo and the wires, and the pilot not only puts in the light, but can turn the apparatus in any direction at his pleasure. In the illustration there is an old gentleman and a lad who are to make a

h

baggage the advantage of the roughest kind of handling. The old colored woman, the stewardess, who always is the kindest, politest of servants, is there too to bid her passengers good-by.

It may be said that river life is not as eventful as it was in the times that are past. The Mississippi is, however, the great natural artery, and on its turbid waters there will always be carried a vast amount of freight. The build of the boats that thrash its waters, the character of their officers and men, differ from those of other days, and the present is all the better for the changes made. Quick to appreciate any advantages, those whose interests lie in steam-boats plying on "The River" the search-light is likely to be generally used. The huge stream, which never is the same, requires a skilled pilot, and besides the conveniences which the electric light gives when a landing is to be made, floating obstructions and snags are made visible of nights, and so dangers are evaded.

ARMY UNIFORMS IN THE UNITED STATES.

(Continued from page 150, Supplement.)

sky-blue with a red stripe. The uniform of the ordnance was the same, except that the stripe on the trousers was blue. The infantry uniform had white edgings and turn-backs, the trousers white stripes, and the plume was of white cock feathers. The turn-backs of the dragoon coats were yellow, as were the stripes on their "blue-gray" trousers. On their cap was a drooping white horse-hair pompon, that of the officers having a strip of red hair.

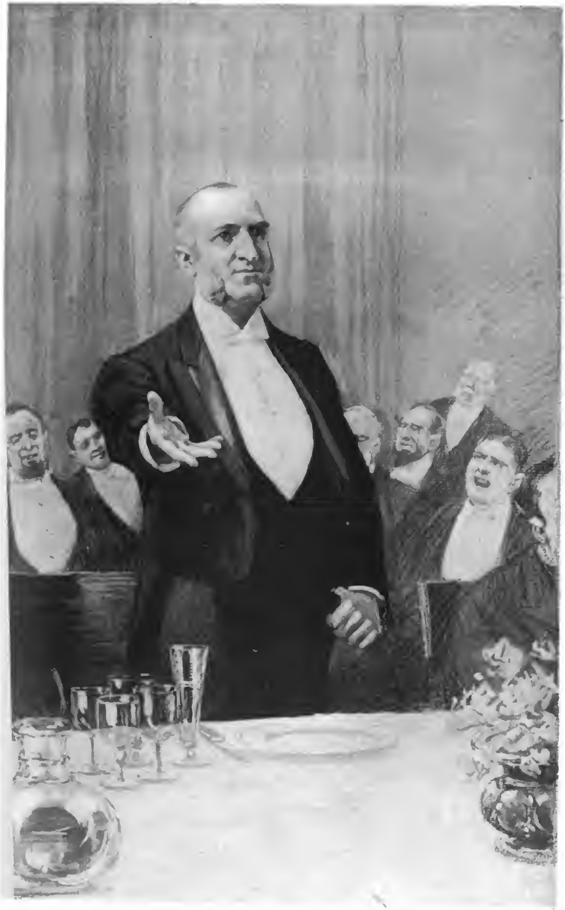
In 1835 the spread eagle was adopted as the indication of rank on the epaulettes of the colonel. The epaulettes of the major were of silver-lace instead of bullion. All officers who were entitled to epaulettes wore them on both shoulders. Aiguillettes were worn by all general staff officers, except of the engineer and ordnance corps. Shoulder-straps were also introduced.

In 1841 the major-general commanding was permitted to have his cuffs and collar embroidered with gold oak leaves on dark blue cloth. The color of the plume of the adjutant-general was changed to white, and of the inspector-general to green. Three black ostrich feathers were prescribed for the engineers not topographical. The topographical engineers wore black plumes of the same form as those of the general staff.

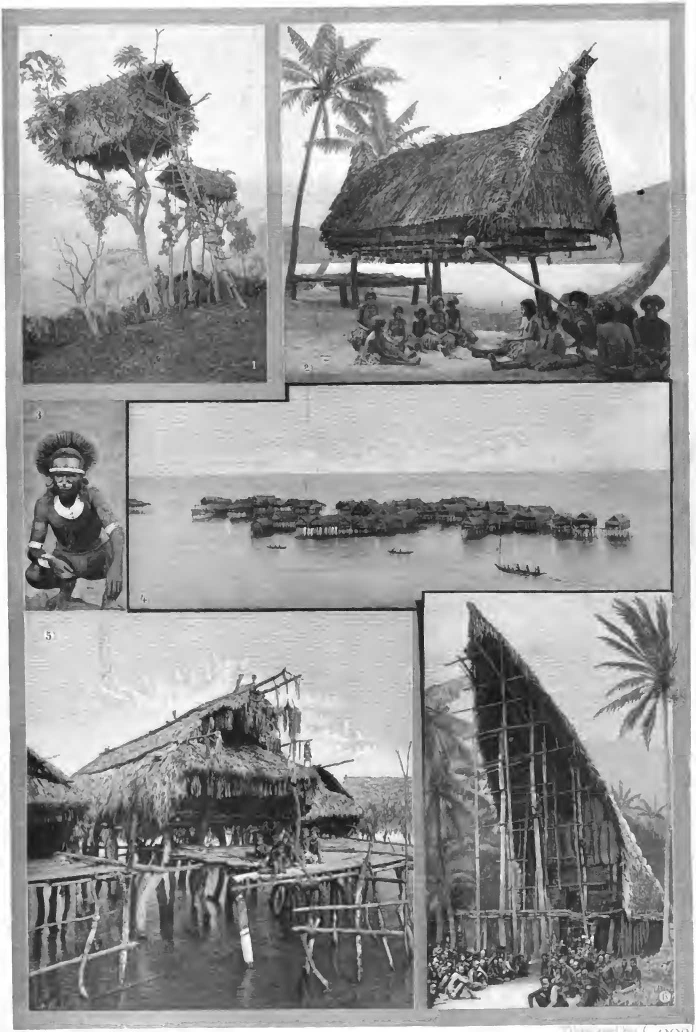
In 1847 what were the uniforms of the Mexican war were substantially provided for in regulations. Then the army wore the roundabout jacket, the infantry had waist belts, and the pancake forage-cap was introduced. Mounted riflemen were uniformed very like the dragoons, the trousers being edged with yellow cord. Foot riflemen wore dark gray coats and trousers, the seams of the latter being edged with yellow cord. Chevrons were prescribed for all non-commissioned officers. They were precisely as they are now, except those worn by ordnance sergeants, which were not determined until 1857; the point of the angle, however, was up instead of down.

Under the regulations of 1857, buff disappeared from the uniforms of general officers. The collar and cuffs of the coat were dark blue velvet. The designating colors of the different arms were fixed as follows: Infantry, sky-blue; mounted riflemen, emerald green; dragoons, orange; cavalry, yellow; artillery, scarlet; engineers, yellow; ordnance, crimson. All trousers, except those of the general officers and staff, which were dark, were sky-blue. Another monstrosity in the way of head covering was invented at this time—the soft dress hat turned up on one side, or with stiff brim, which became very familiar during the war. The infantry color remained sky-blue for several years. Recently the white was restored. From the time of the Mexican war frock-coats, with full skirts, another French invention, have been worn, and the full-dress coats of men and officers during the war of 1861–65 were long-skirted.

The service dress, well remembered, for it is not long out of date, consisted of blouses for the foot and jackets for the cavalry and artillery. Dark blue for coats and light blue for trousers and overcoats are the colors that have been recognized for years. At the present time the chapeau has been readopted for general officers and the staff, but it is a different and a lower hat than that worn by General Scott. None but general officers now wear sashes and epaulettes. Line officers wear shoulder-knots and gilt sword-belts. The colors of the various arms and staff departments are as follows: Artillery, scarlet; cavalry, yellow; infantry, white; ordnance, crimson and white; engineer, yellow; quartermaster, buff (a recent adaptation of the old combination of blue and buff); signal corps, orange; and ordnance, scarlet and white. Enlisted men of the cavalry and artillery wear scales. The old forage-cap of the last war was almost as ugly as the dress hat. It was of blue cloth, with an inclined visor, and was so high and stiff that the top fell forward. It was hooked to the visor. Since then the army wears the French képi for fatigue, but it is not so comfortable or smart in appearance as the cap of the French army. After a short experience with a modern shako for a dress hat, the helmet was



HON. CHAUNCEY M. DEPEW.—Drawn from Life by T. de Thulstrup.—[See Page 166.]



NATIVE LIFE OF NEW GUINEA.—FROM PHOTOGRAPHS.—[SEE PAGE 166.]

1. Tree House. 2. Sleeping House. 3. A Native. 4. Marine Village of Supuselia. 5. Chief's House, Supuselia. 6. Chief's House, Olarri.

The Commodore called on him, and asked him to return his visits. Wherever they met, the Commodore put shrewd, quick questions to him, and got back just as shrewd answers, just as quickly uttered—a feature of the dialogues that greatly pleased the financier. Thus the social relations between the two came to bear fruit in the way of business for Mr Depew. He had the power to instantly concentrate his mind upon a given subject to the exclusion of all else. It is a very uncommon and remarkable gift, and has become the key-stone of his greatness. The Commodore had neither time nor patience for the traditional lawyer, who asks to have every matter for his consideration submitted in writing, with a profusion of detail, and who then buries it and himself in an office miles away, to set in force processes as mysterious and as slow as hatching chickens. The Commodore was in the last degree a difficult man to satisfy. He wanted legal advice as men get definitions from a dictionary or griddle-cakes at a restaurant. But it was not merely his lack of patience with the formula of lawyers that made him cling to a man who could dispense with them as Mr. Depew could; the matters he wanted counsel upon were too important, bold, and valuable to the speculative world to be put in writing, and handed about in a law office from lawyer to clerk and clerk to copyist. The great railroad operator avoided this risk of defeat by retaining counsellors who heard him discuss his plans, and then, taking a few notes only, went to their homes or their libraries to study and reflect. But the Commodore never was satisfied until he met Mr. Depew, who settled all his problems one way or the other on the spot; who could return answers as fast as the Commodore could put questions, and that was as fast as a cowboy can shoot, or the reader can snap his fingers.

This remarkable trial of Mr Depew's more than remarkable faculty was being made by Commodore Vanderbilt during the year that followed the young lawyer's election to the office of Secretary of State. Mr Depew declined a re-election to that office, declined the offer by W. H. Seward of the post of Minister to Japan, and would have had a chance to decline the honor of being the Collector of this port if President Johnson had not torn up the commission after signing it, because of a quarrel with the Hon. Edwin D. Morgan, who had asked it of him. Commodore Vanderbilt's influence was strong in this eventful juncture in Mr. Depew's career, for the old Commodore had no liking for politics and no patience with men who sought public office. In crowded stages time brought Mr. Depew his thirty-second year, and at that age, in 1866, the founder of the Vanderbilt fortunes appointed him attorney for the Harlem Railroad. His rise in rank as an officer of the Vanderbilt system kept pace with the growth of that gigantic foundation.

With the consolidation of the Harlem and Central roads he became a director of the system and its attorney. Other roads were taken in, and he became a Vice-president. As the ball swelled he who rode on top of it was lifted higher and higher. Before the Commodore died Mr. W. H. Vanderbilt had become attached to and dependent upon Mr. Depew. Next he died, and the world discovered what the Vanderbilts had found out far earlier, that all the while the lawyer had been giving out legal advice he had been imbibing a knowledge of railroading and of financiering. He became the President not of the comparatively little corporation built up by the Commodore, but of the majestic system that includes the Harlem, Hudson River, New York Central, Lake Shore, Michigan Central, Nickel Plate, St Paul, and West Shore roads. Better yet, he has demonstrated his fitness for the place so plainly that he who rides may read assurance of it.

Few now think of Mr. Depew as a lawyer, yet it is a question whether any consulting attorney in the country attends to anything like the volume of important business that accrues to him in his different relations. It is scarcely a question whether any man outranks him as the custodian of vast sums of money. First as a trustee, and then as a lawyer, having charge of great estates, he has the care of more millions than any other American. Not all the men who know what his responsibilities are can fathom the secret of his method of crowding into such a life all the social and political and public functions he performs. It is customary among the men who see him every day at the Grand Central Depot to dodge the question by calling him a "wizard." But that which distinguishes him in his relations to the world is the same faculty that impressed the first great Vanderbilt—that of focussing his knowledge, his memory, and all his other wits upon one matter after another, each separately and in its order. He never borrows trouble or considers a care till he comes to it. Then he thinks of nothing else, though the matter in hand may be a trifle, and he may know that in another hour the most vexatious difficulty is coming up for discussion.

He is the only man in the world, I suspect, who, having a speech to deliver at night, gives it no thought until he closes his desk at five o'clock on the evening of the event. This is his habit. Shut up in his library from half past five o'clock until half past six or seven o'clock, he emerges to dress himself for the occasion, ready then or at any subsequent moment to deliver a carefully prepared address.

NEW GUINEA.

Among the islands of the world New Guinea stands second in size to Australia, of which at one time it has evidently been a part. The geological character of the bottom of the shallow Torres Strait, which, with a width of eighty miles, separates the two islands, shows that it was a connecting isthmus before its submersion, which probably occurred in the Miocene period. New Guinea lies immediately north of Australia, between 0° 25′ and 10° 40′ south latitude, and between 130° 50′ and 150° 35′ east longitude. It is 1490 miles long, with a maximum breadth of 430 miles, and its area is 306,000 square miles. In its general configuration it is mountainous, and its coast-line is composed of steep cliffs broken by the swampy deltas of navigable rivers, some of which streams are of considerable size. A barrier reef, with openings that afford a safe harborage for large vessels, lies outside of much of its coast. From its situation, almost directly under the equator, the climate of New Guinea is hot and humid, and on the coast unhealthful. This great region thus far has baffled all attempts by explorers to penetrate it, and, except for a very scanty knowledge concerning its coasts, remains to civilized man an unrevealed tract. Though it is still practically unexplored, the existence of this island is not a recent discovery to navigators, for it is probable that it was sighted by A. Dabreu in 1511. It was apparently first visited either by the Portuguese Dom Jorge de Meneses, driven, on his way from Goa to Ternate in 1526, to take shelter on the northeast coast, or by the Spaniard Alvaro de Saavedra, two years later. By Ortiz de Retez, or Roda, who, in 1546, first laid several points along the north coast, the name of "New Guinea" was probably given to this island. In that century and the two following centuries, though the coast was visited at different times by the illustrious navigators Schouten and Lemaire, Tasman, Dampier, Torres, Bougainville, and Cook, little additional knowledge concerning it was gained.

The remoteness of New Guinea from the usual courses of merchant vessels, the steep cliffs of its coast, the dense forests, and, where the shores are low, the swamps and malarial jungles, together with the treachery and ferocity of its inhabitants, are causes which have rendered it so long a mystery to civilized eyes. While its coast-line is comparatively well mapped, but little more is known of the interior than that it contains high mountain ranges, some of which are visible from the sea, but they have so far proved inaccessible. D'Albertis, the Italian explorer, in 1776-7 steamed in the 10-ton launch *Neva* 500 miles up the Fly River, in the south part of New Guinea. He found the vegetation to be Australian in character, the river-banks low and swampy. As he penetrated the interior of the island he noted that the people were more civilized than those residing upon the coast, but they were warlike and treacherous, sometimes endeavoring to entice his party into ambuscades upon the shore, and several times attacking his launch with fleets of canoes.

Attempts by explorers to push by land into the interior have invariably failed before much progress was accomplished. All observations that have been made confirm the fact that New Guinea is rich in fruit and plant life of many descriptions, that the soil is fertile, the scenery magnificent in many parts, and that the island teems with inhabitants. It is by the great waterways into this island that the most important explorations have been made. By no other way could any part of the interior be as yet safely entered.

But little knowledge of the interior of New Guinea can be obtained from its native peoples, which consist of a great number of isolated tribes, differing much in appearance and language. These communities live at constant feud with one another, and can give little information of tribes beyond the limits of their respective domains. There are a variety of types among the people, the prevailing characteristics of race being those known as the Papuan, which are found especially in the southeast of the island. In this type is found long frizzy hair, which is dressed by its owners into the form of a mop; a skin removed just a shade from black; a prominent aquiline nose, depressed at the point, and protruding lips, which cause the chin to appear to retreat. Leprosy, elephantiasis, itch, and ophthalmia are frequent among the New Guinea natives, and fully a third of them are afflicted with a malignant ringworm caused by a microscopic insect. Among certain coast tribes of the island the intermixture of Arab and Malay blood has produced a fairer type of people, superior to the Papuans; other New Guinea tribes resemble the Polynesians. In the mountainous northern part of New Guinea, at Andai, are the Arfaks, which are described by D'Albertis as a fine, tall, strong people, superior to natives of the coast. The type of the mountain tribes is generally Papuan, and the expression of their countenances is melancholy. Among them, according to this explorer, are albinos; and some tribes have the woolly hair of the genuine negro. Among the natives the level of civilization varies, but it seldom reaches even the average Pacific island standard. They have no single name for New Guinea, nor any idea of its extent, only using terms signifying "great land" to distinguish it from the adjacent islands.

On the west coast there is a semi-civilization, due to intercourse with the Malay and Bughis traders who have settled at various points, and on the west coast Mohammedan teaching has also some civilizing effect. The natives have little religious feeling, but they are superstitious, standing in great fear of evil spirits of the dead. Music is a passion with them, and this characteristic renders them amenable to the influence of the missionaries, but as converts to Christianity they show no warmth of devotion, differing in this respect from the Polynesians. Many of the tribes at the west end of New Guinea are head hunters and cannibals, and, in fact, cannibalism is generally practised among the natives throughout New Guinea. The people display a frequent hostility and mistrust of strangers, which sentiments are perhaps partly caused by slave-hunting raids, to which they have been subjected, and ill-treatment by traders. The mountain tribes are usually despised by their coast neighbors as being ruder and more destitute of resources than themselves; but where the mountain folks are more numerous and fiercer, as in the south of West New Guinea, they repay this feeling with interest, and the coast people live in perpetual terror of their neighbors, who plunder and enslave them. When a tribe gets too strong for its neighbors, they combine to destroy it. Other causes of wars are outrages or insults which under their code must be avenged; or the sudden death of some member of a tribe is ascribed to the witchcraft of an enemy, for no death in New Guinea is believed by the natives to be the result of natural causes. But all these reasons for warfare are really excuses for cannibalism and head hunting.

There is a style of house construction common to all tribes in New Guinea, the peculiarity of which is the building of houses raised from the ground or above the water on piles. Mr. Basil H. Thomson describes the coast villages of the Motu, Saroa, Loyalupu, and other tribes, as being usually built on piles above the shallow water between the coral reef and the shore, from a quarter to half a mile distant from land, as is the case of the village of Supuselia, shown in the accompanying illustrations. This style of architecture is identical with that of the lake dwellers of old, once so common throughout Europe. The house interiors are littered with mats, pots, and the utensils of daily life. They are much crowded, and the frail structures rock in the strong wind; but as New Guinea is outside of the hurricane belt, fire destroys more of them than the storms. The piles are short-lived, owing to marine borers, but when a house becomes rickety new piles are inserted beside the old ones. Many of the houses on shore are built, as is shown in illustration 4, to represent the crocodile, the over-reaching roof imitating the upper jaw of the open mouth, and the projecting platform on the ground the lower. The poles and rafters are often decorated with the skulls and bones of enemies that the owners have killed and eaten. Those native villages which stand upon land usually have a number of tree houses—houses built in the tops of the tallest trees as a means of refuge in case of an attack upon the inhabitants.

Mr. Bell, a photographer of Australia, who accompanied one of the latest exploring expeditions, and who made some of the photographs from which the accompanying illustrations were taken, relates that on one occasion, while ascending a river in New Guinea, a number of the natives, who had never seen white men before, were induced to come on board the steam-launch, and in a short time became friendly. They were delighted with everything they saw, until they discovered in a cask some salt beef, which they evidently took for something else. They had a hurried consultation, no doubt arriving at the conclusion that the whites were cannibals like themselves, for they leaped into their canoes and paddled away as fast as possible, and could not be induced to return to the vessel. There are to-day hardly more than a score of white residents in New Guinea, and these are mostly traders and pearl fishers. An English mission is established at Port Moresby, under the care of the Rev. J. W Chalmers, of the London Missionary Society, whose teachers reside at all the principal villages of the Motu district.

A considerable trade is carried on between the different tribes along the coast. The natives in the neighborhood of Port Moresby manufacture pottery, and exchange it for sago with the tribes to the westward. The annual trading cruise is to them an important event. Large sailing craft called *lakatois* are made by lashing four or more canoes together. Masts and sails are rigged, and the whole loaded with pottery; then, taking advantage of the southeast trade winds, they sail westward to the villages on the coast and the rivers of the Papuan Gulf, exchanging their ware for sago and the other products of the region visited; then, after several weeks of feasting, they catch the northwest monsoons, which carry them homeward with their deeply loaded vessels. The natives, who have always borne a bad name as pirates, are believed to still sometimes combine a certain amount of piracy with their trading voyages along the coast.

The mammals of New Guinea are akin to those of Australia, but are limited in variety. The land swarms with wallaby of two species, and with a peculiar form of pig, opossums, a species of bandicoot, or wild rat, and mice. There is some reason to think that an exploration of the interior might reveal living specimens of the gigantic marsupials found as fossils in the Queensland Pleistocene. Of birds there is a great variety, among them the cassowary is included. The beauty and number of the birds are great, and out of 1028 species identified, 470 are peculiar to New Guinea and the adjacent islands, including Aroo. The more numerous and important genera are pre-eminently Australian in character, with many species peculiarly developed. Here abound birds-of-paradise, honeysuckers, flycatchers, parrots, crows, kingfishers, and pigeons, all rich in special forms and most of them distinguished by beauty of plumage. Birds of prey are rare. One of the most remarkable species of the bird family in New Guinea is the scrub-hen (*Megapodius tumulus*), which erects great mound nests, often more than ten feet high, and its eggs furnish the natives with animal food in the egg season, as a number of hens lay in one of these nests for several seasons. The brush turkey, a large species of the scrub-hen, lays eggs in the same mounds. The hot, moist climate on the coast becomes especially unhealthful during the transition between the monsoons, which period is long and irregular, owing to the action of the high mountain ranges on these winds. The heat is tempered by the heavy rainfall discharged by the northwest monsoon, chiefly in the west and north; the southeast monsoon also is wet, especially in the east and south districts. Over a great part of New Guinea dense forests prevail, clothing the mountains to an altitude of several thousand feet with timber of enormous height. The trees are matted with creepers, and there is a dense undergrowth of brushwood, ferns, and lycopodiums. Great reeds and grasses cover the swamps and open spaces. The plants usually found in the tropics abound; the cocoa-palm grows everywhere; the sago-palm grows wild in abundance in the swamps. Tobacco of a good quality and an indigenous cotton plant are also found.

Politically, New Guinea is divided among Holland, Germany, and Great Britain. The Dutch, who for many years have maintained a desultory trade on the coast, hold a nominal sovereignty over the northerly half of the island, claiming all the territory that lies west of 140° 47' east longitude. The southeasterly part is divided about equally between Germany and Great Britain. Germany in 1885 and 1886 made the northerly part of south-east New Guinea—the territory lying between Humboldt Bay and Huon Gulf—a German possession, and gave it the name of Kaiser Wilhelm Land. Here a German trading and colonization society, known as the New Guinea Company, has established stations on the coast at Finsch Haven, Constantine, and Hatzfeld harbors, but nowhere on the island has any power made an attempt to found a colony.

Since 1884 a British protectorate has been administered by a commissioner over the part of New Guinea claimed by Great Britain. Owing to the undefined nature of his executive and judicial powers, and the probability that an influx of Europeans would result in hostilities with natives, settlement by Europeans has been discouraged. In 1888 the territory controlled by Great Britain was declared a British possession by royal letters-patent, and the flag finally hoisted at Port Moresby on September 4th of that year. That New Guinea is ever to have a future of any great importance to the white race is uncertain. Should the climate of the uplands and plateaus of the interior prove to be salubrious, and the land suitable for planting or grazing, as has been predicted by explorers, then in a few years there may be a marked change in the country. A discovery of precious metal, of which there are indications, would hasten immigration, and pave the way for a more permanent settlement. Should none of these possibilities occur, however, then New Guinea is likely to remain for a long time as it is to-day.

COUNT ANDRASSY.

Count Julius (Gyula) Andrassy, who died on February 18th, at Volosca, near Fiume, where he had been sojourning for some time in the hope of improving his health, was a very prominent figure in the work of the reconstruction of Europe which has taken place since 1850. He was born in the county of Zemplen, Hungary, on March 8, 1823. His father, Count Charles Andrassy, was an influential member of the national diets, and a publicist of merit. His family is an old one, dating back to the sixteenth century in Hungary, and to the thirteenth in Bosnia.

Count Julius was a member of the Presburg Diet, Lord Lieutenant of the county of Zemplen, and an active mover in the revolutionary epidemic which spread over Europe in 1848. He led the militia of his district against the Austrians, who, with the aid of Russia, reduced Hungary to the condition of a province. Just previous to the collapse of the patriotic cause, Andrassy was sent as minister to Constantinople, and his absence from home doubtless saved his life, as he seems to have been condemned to death with others who suffered the penalty. As it was, he was hanged in effigy only, and reserved to render brilliant services to and receive high honors from the power which then sought his destruction. The Turkish authorities refused to deliver him up at the request of Austria; but to relieve the former of any embarrassment, Andrassy went to France, and lived there and in England until the Magyar patriots were amnestied in 1857. His talents and agreeable personality made him a notable favorite in the societies of the Western capitals.

Returning to Hungary when it had become feasible for him to do so, he soon entered into public affairs, and became Deak's most valued coadjutor. The Prussian victory at Königgrätz in 1866, in humbling Austria, led her to adopt a policy of conciliation toward the Hungarian people, with the result of granting them practically what they had fought in vain for in 1848. They were given an independent parliament, and Andrassy, at the request of Deak, who declined office himself, was made their Prime minister. One of his early official acts was to conduct the ceremonies wherein the Emperor and Empress of Austria were crowned King and Queen of Hungary, at Buda-Pesth. His term of office was signalized by the institution of important reforms, one of which was the restoration of trial by jury, and another, the removal of political disabilities from the Jews.

In 1871 he was called to succeed Count Beust as Foreign Minister of the Austro-Hungarian Empire, the chief officer under the Emperor of the dual government. The new German Empire had just been created, and Andrassy was one of the chief factors in the formation of the triple alliance known as the *Dreikaiserbund*. This was broken up after some years by the events connected with the Turco-Russian war, and the snatching of the fruits of victory from the victor. In all the diplomacy of that troublesome period he played a conspicuous part. He represented Austria in the Berlin Conference of 1878, and was instrumental in adding Bosnia and Herzegovina to the Austro-Hungarian Empire, and in extending its influence in the Balkans generally. He resigned his ministerial office in 1879, apparently because of internal complications arising out of the new order of things he had been instrumental in bringing about. Since his retirement ten years ago he has held no official position, but has retained a lively interest in governmental matters, and has been a trusted adviser.

NEAR EAST HAMPTON

(A PAINTING BY A. F. BUNNER.)

Above the new leaves of the old bent tree—
A trembling olive sea—
The light-winged bluebirds play,
And in the meadow stretching far away
The dusty bees among the flowers stray,
Where the glad bobolink
Floats on a tide of song above the clover pink.

I see the tawny fields of dimpling rye
Beneath a peaceful sky,
And hear the crystal brook
Murmur along through many a cressy nook
That weeping willows softly overlook,
And see the cloud-ships rest
In pale armadas far adown the rosy west.

Softly the purple-footed shadows creep
About the huddled sheep,
While all the happy land
Is by the amorous wing of summer fanned,
Festooned with roses, soothed by breezes bland,
And in a fairy dream
Like the light lily on the bosom of a stream.

Oh, perfect shining day, all green and gold!
What happiness untold
We'd know if so arrayed
Were all our fleeting days!—knowing no shade
Save that by brightest smiling sunshine made,
As when it gayly throws
Across the lily's face the shadow of a rose!

R. K. Munkittrick.

SOME MIDWINTER GAME BIRDS.

What an inspiring, rejuvenating, wholesomely savage sound is the "honk, honk" of the wild goose dropping down to us some morning at the close of a tiresome winter,

"As March leads forth across the leas
The wild and windy spring"!

It is a sound full of sap, and starts budding within us that seed of nomadic and wild nature inherited from those far ancestors to whom the mountain ranges were but challenges to exploration, and the ocean an invitation to travel and conquest. We look up and see the far-away triangle "harrowing the sky" on tireless pinions, cleaving its way with firm and unswerving speed toward the pole. Whence have they come? We have watched and shot at them on many a Southern bayou and inland lake; but surely these scornful emigrants are not from such near and common haunts. Whither are they bound? Imagination likes to follow—pleases itself with picturing the new scenes, the pungent adventures they must encounter from day to day before the far blue waters of Hudson's Bay and Athabasca Lake, or the desolate ice cliffs of King William's Land, invite them to pause for a summer's sojourn.

"Steering north with raucous cry,
Through tracts and provinces of sky,
Every night alighting down
In new landscapes of romance,
Where darkling feed the clamorous clans,
By lonely lakes to men unknown."

Game laws are of little service to the wild-goose. Everywhere he must run the gauntlet of the guns, and pay for his liberty the price of eternal vigilance. His arrival in his far Northern breeding grounds is hailed as the season of plenty by Esquimau, Indian, and white hunter, who search out his down-bedded nests in the morasses or on the cliffs to rob them of eggs and goslings, set snares and spread nets for the adults, chase them with spears, and kill them with gunshot by the hundred. The natives fatten upon their juicy flesh, and the fur traders preserve thousands for winter use. Foxes, weasels, ermines, and other marauders prey upon eggs and young, and the eagles, larger hawks, and great jaeger-gulls strike them down in mid-air. Finally, when the short summer is over, and their feeding grounds are skimmed with ice, and the numbing air admonishes them to be gone, the geese must run the gauntlet of the forest Indians of the Saskatchewan Valley and Upper Canada, must spring away from well-concealed gunners surrounding every pond and river head from Lac St. Jean to the Kootenay, and will find no rest from enemies when they at last settle down in the broad marshes of the United States. Yet so watchful, suspicious, and strong of wing are they that enough wild-geese escape all these perils to keep the ranks nearly as full as ever.

The migration does not seem to be continuous, but by stages, from feeding ground to feeding-ground. This is especially true in the fall, when the birds are loath to leave the North, and like to make as long halts *en route* as the weather permits. Hence they are often overtaken by storms, and then fly low, and drive through the rushing flakes almost or altogether at random, landmarks being obliterated. In the evening of such a day, as the observant Hudson's Bay Company's men inform us, the geese will sink to the ground and plunge into the fleecy drifts for shelter. But at just such a time the foxes and carcajous are most hungry, and hence most to be dreaded. Well aware of this, the geese sagaciously press their way forward for some yards, so that if a fox should trace and enter their tunnel, they may have plenty of start in making their escape.

There are no less than a dozen species and varieties of goose and brant that visit the United States in more or less numbers. Of these the *Branta canadensis* is the common wild-goose, which breeds in suitable places all along our Canadian frontier, as well as far to the northward. The brant is another large kind, furnishing capital sport along the northern Atlantic sea-shore, while some of the other species are more common in the Western States than on the Eastern seaboard.

Courageous in his sense of strength, a swan is the first bird from the South to reach the shores of arctic America, and to the native people there, almost worn out by their long contest with cold and starvation, he is a messenger of spring, and his advent the occasion of wide and hearty rejoicing. but this leader of the northward hastening column of migrant water-fowl is the great *trumpeter* of the Pacific coast—and a proper leader too!

Rear guard of that column, last of the migrants to be noted sailing over the posts of the fur traders on Hudson's Bay, on Peace River, and along the Mackenzie, goes the smaller whistling swan, the subject of our illustration, with which sportsmen of the United States are the more familiar, and which is also a resident of the polar shores and islands of the Old World. In severe winters it is forced as far south as England, central Europe, and the marshes which border the Caspian. It is daily seen in southern Siberia and Thibet, and is one of the visitants of China and northern Japan.

To the aborigines of all the semi-arctic zone this bird is of the greatest value, not only because its flesh and eggs are edible, and a grateful change from their winter diet of dried fish and moss, but because its down and feathers enter into the few materials available for clothing. At the most northerly Hudson's Bay posts great numbers of the bodies of these birds are salted down, to be served out as rations to their men and the Indian hunters during the succeeding winter.

One of the populous breeding haunts of this swan was discovered by Captain Dale near the mouth of the Yukon, in Alaska; and he tells us that in July, when the big birds are moulting and cannot fly well, the Esquimaux slaughter them by means of their cleverly barbed bone tridents, which combine the service of a spear and a grapnel. These Esquimaux, as well as their neighbors of the Tinneh, further east, flay nearly all they secure, and save the skins to be made into under-clothing; but the carcass is not refused on that account, even by the white men of that region. "In Iceland, to the inhabitants of which," according to Selby, "the down and feathers are of great value, not only for domestic comfort, but as an article of barter, they are hunted down and killed in great numbers in the month of August, at which time the old birds are unable to fly, having cast their quill feathers. At this season the natives assemble in bodies in places where the swans are most abundant, attended by dogs, and mounted upon small but active horses, purposely trained to pass over bogs and through marshy soil; the chase then commences, and many are ridden down, but the greater number are caught by the dogs, which always seize by the neck, a mode of attack that causes the bird to lose its balance and become an easy prey."

Returning from the North, the swans and their young appear in the United States in company with the geese, but seem to fly wholly by an inland route, and are rarely seen on the coast of New England. Their flight is usually at a great elevation, in a straight line, and with a rapidity no doubt exceeding 100 miles an hour when under full headway. Not the least interesting thing connected with this southward flight is the fact that upon the back of nearly every swan are perched a little company of warblers and flycatchers, which take this rapid and easy method of making the journey to and from the arctic lands, where they love to breed, but which they could rarely reach or get away from upon unaided wings.

Coming to our ears from a great height or across a wide and wind-swept marsh, the note which gives them the name "Whistling" is not disagreeable, but near at hand it seems rather a harsh and piercing scream. It drops to feed in wide marshes and estuaries, and is sometimes caught alive, when it is easily tamed, and thrives, but is said to refuse all companionship with the ordinary tame swans, from which it is easily distinguishable by its habit of holding its neck at right angles, instead of in the rounded and graceful curve the mute species affects.

"The few swans that are annually secured on the Atlantic coast are for the most part killed on the Chesapeake Bay or at Currituck. They are not systematically pursued, but are generally captured by carelessly flying too close to gunners who are lying in wait for ducks or geese."

They should always be shot through the head or neck, as the feathers of the body will resist ordinary shot.

The natural enemies—that is, those apart from man—which the swan need fear are few, since it is so wary, so large and powerful, that it can escape or resist nearly all others. The eagles, however, are able to strike it down, and no doubt the peregrine falcon or duck hawk, and the great white owl, can now and then overcome weak or disabled ones, while the foxes, wolverenes, and other prowlers often make a meal off an unguarded nest. The fact that the swan lays only two eggs, while nature thinks it needful that water-fowl generally should hatch a dozen or more young apiece, in order to insure the perpetuation of the race, is indirect but very substantial testimony to the comparative immunity from danger this king of the marshes enjoys.

One of the most interesting of Mr. Beard's present series of pictures is that of the long-billed curlew which accompanies this text. The curlews are a numerous and wide-spread family of birds, some of the species being common to both Europe and America, though he of the long bill (*Numenius longirostris*) is peculiarly our own. They are all much alike in appearance and manners, though not in size. Migratory in habit, they are during winter residents of the beaches and muddy shores of the sea and of the mouths of rivers, associating in flocks, and feeding upon marine insects, worms, minute shell-fish, roe, and other animal matter, obtained principally by repeatedly poking their sensitive bills into the ooze on the chance of striking something edible. Their tall unfeathered legs and long sickle-shaped beaks enable them to carry on this search when the flats are covered with water and the mud worms and crustacea come to the surface.

Early in spring they retire inland and northward, selecting wide plains abounding in marshes and pools of water as suitable regions in which to rear their young. It is one of the surprises of the more Northerly plains, and of the saline lake regions of the Great Basin, to come upon a pair of alarmed curlews shrilly whistling their fright where you least expected such an apparition.

The curlew is an exceedingly timid and wary bird, and the gunner is often tempted to anathematize it as he suddenly hears its loud alarum bidding everything take heed to itself. It will usually keep just out of gunshot, but may sometimes be decoyed by waving a handkerchief on a stick, or otherwise exciting its curiosity. At the best, however, this draws it only a little nearer, and many chances of missing must be taken. In this case, however, the game is hardly worth the trouble, for high seasoning is needed to make the flesh of the curlew acceptable to a palate that has tasted plover, snipe, or woodcock.

How different from the reedy morasses or the rippling tide flats beloved by the swan, the geese, and the curlews, are the home and life of the ptarmigan! Over my desk as I write hangs a little sketch—only a few lines and patches of angular shadow—but enough to convey to the eye a sense of alpine summits:

"The snowy mountain-tops which lie
Piled coldly up against the sky;
Dazzling and white, save where the bleak
Wild winds have bared some splintering peak,
Or snow-slide left its dusty streak."

In the almost blank foreground of the sketch are half a dozen small partridge-like birds, mere outlines in the universal white, whilst another two or three are scudding away like fragments torn from a snow-cloud. These are ptarmigan. More than once, on the high and frosty peaks of the Rocky Mountains, I have come upon little coveys picking up seeds, beetles, buds, and whatever edible they could find between the last shrub of forest and the snow line, and have even met them upon broad snow tracts. Generally they were utterly unsuspicious, so that I might have caught them in my hands. On some of the high peaks miners live during the summer, and these "mountain chickens" come familiarly around their cabins, grateful for crumbs and companionship.

This Rocky Mountain species is the "white-tailed," and, so far as we know, it is confined

eaves the alpine grass-plots, pairs of ptarmigans scrape together a few leaves and bits of moss under the shelter of a rock, and presently sit upon a dozen handsomely painted eggs until the gray and downy chicks arrive. These speedily run about, quite independent of motherly care, as befits one born amid such exigencies.

> "Child of the clouds! remote from every taint
> Of sordid industry thy lot is cast.
> Thine are the honors of the lofty waste.
> Not seldom, when with heat the valleys faint,
> Thy handmaid Frost with spangled tissue quaint
> Thy cradle decks; to chant thy birth thou hast
> No meaner Poet than the whistling Blast;
> And Desolation is thy Patron Saint."

The willow-grouse is a ptarmigan whose summer plumage is reddish buff, and which in winter keeps jet-black feathers in the side of its tail, instead of turning wholly white. It is very numerous north of the Saskatchewan forests from Alaska to Greenland, and is of much importance as a food resource to the Indians and fur hunters of that region. Its fondness for willow thickets, upon the buds of which it mainly subsists, gives it its name. A third species, properly belonging to Greenland and the adjacent main-land, is occasionally seen around Hudson's Bay in severe winters, and seems to be the same as the rock-ptarmigan of boreal Europe.

THE GREAT MEETING OF AMATEUR ATHLETES UNDER THE AUSPICES OF THE BOSTON ATHLETIC CLUB.

DRAWN BY HENRY SANDHAM.—[SEE PAGE 171.]

fanwise, the sticks being represented by regiments strung out along the line of route backward to the divisional transport columns, and all the lumber that trails behind an army on the move. On its right the broken left of the Army of the North was flying in mass, chased by the Southern horse and hammered by the Southern guns, till these had been pushed far beyond the limits of their last support. Then the flying Army of the North sat down to rest, while the elated commandant of the pursuing force telegraphed that he held it in check and observation.

Unluckily he did not observe that three miles to his right flank a flying column of Northern horse with a detachment of Ghoorkhas and British troops had been pushed round as fast as the failing light allowed, to cut across the entire rear of the Southern Army, to break, as it were, all the ribs of the fan where they converged, by striking at the transport reserve, ammunition, and artillery supplies. Their instructions were to go in, avoiding the few scouts who might not have been drawn off by the pursuit, and create sufficient excitement to impress the Southern Army with the wisdom of guarding their own flank and rear before they captured cities. It was a pretty manœuvre, neatly carried out.

Speaking for the second division of the Southern Army, our first intimation of it was at twilight, when the artillery were laboring in deep sand, most of the escort were trying to help them out, and the main body of the infantry had gone on. A Noah's ark of elephants, camels, and the mixed menagerie of an Indian transport train bubbled and squealed behind the guns, when there appeared from nowhere in particular British infantry to the extent of three companies, who sprang to the heads of the gun horses, and brought all to a stand-still amid oaths and cheers.

"How's that, umpire?" said the major commanding the attack, and with one voice the drivers and limber gunners answered, "Hout!" while the colonel of artillery sputtered.

"All your scouts are charging our main body," said the major. "Your flanks are unprotected for two miles. I think we've broken the back of this division. And listen! there go the Ghoorkhas!"

A weak fire broke from the rear-guard

camp, and so made the experiment of its effect. Long before the fatigue party sent to collect brushwood had returned, the men were settled down by their valises, kettles and pots had appeared from the surrounding country, and were dangling over fires as the kid and the compressed vegetables bubbled together; there rose a cheerful clinking of mess tins, outrageous demands for "a little more stuffin' with that there liver wing," and gust on gust of chaff as pointed as a bayonet and as delicate as a gun butt.

"The boys are in a good temper," said the major. "They'll be singing presently. Well, a night like this is enough to keep them happy."

Over our heads burned the wonderful Indian stars, which are not all pricked in on one plane, but preserving an orderly perspective, draw the eye through the velvet darkness of the void up to the barred doors of heaven itself. The earth was a gray shadow more unreal than the sky. We could hear her breathing lightly in the pauses between the howling of the jackals, the movement of the wind in the tamarisks, and the fitful mutter of musketry fire leagues away to the left. A native woman in some unseen hut began to sing, the mail train thundered past on its way to Delhi, and a roosting crow cawed drowsily. Then there was a belt-loosening silence about the fires, and the even breathing of the crowded earth took up the story.

The men, full fed, turned to tobacco and song—their officers with them. Happy is the subaltern who can win the approval of the musical critics in his regiment, and is honored among the more intricate step-dancers. By him, as by him who plays cricket craftily, will Thomas Atkins stand in time of need when he will let a better officer go on alone. The ruined tombs of forgotten Mussulman saints heard the ballad of "Agra Town," "The Buffalo Battery," "Marching to Kabul," "The long, long Indian Day," "The Place where the Punka Coolie died," and that crashing chorus which announces

> "Youth's daring spirit, manhood's fire,
> Firm hand, and eagle eye
> Must he acquire who would aspire
> To see the gray boar die."

To-day, of all those jovial thieves who appropriated my commissariat, and lay and laughed round that water-proof sheet, not one remains. They went to camps that were not

ould Silver made them pay for the fun. Faith, I've seen Hamlut played wid a new black eye, an' the Queen as full as a cornucopia. I remember wanst Hogin that 'listed in the Black Tyrone an' was shot in South Africa, he sejuced ould Silver into givin' him Hamlut's part instid av me, that had a fine fancy for rhetoric in those days. Av coorse I wint into the gallery an' began to fill the pit wid other people's hats, an' I passed the time av day to Hogin walkin' through Denmark like a hamstrung mule wid a pall on his back. 'Hamlut,' sez I, 'there's a hole in your heel. Pull up your shtockin's, Hamlut,' sez I. 'Hamlut, Hamlut, for the love av decency dhrop that skull an' pull up your shtockin's.' The whole house begun to tell him that. He stopped his soliloquishms mid between. 'My shtockin's may be comin' down or they may not,' sez he, screwin' his eye into the gallery, for well he knew who I was; 'but afther the performance is over me an' the Ghost 'll trample the guts out av you, Terence, wid your ass's bray.' An' that's how I come to know about Hamlut. Eyah! Those days, those days! Did you iver have onendin' devilmint an' nothin' to pay for it in your life, sorr?"

"Never without having to pay," I said.

"That's thrue. 'Tis mane, whin you considher on ut; but ut's the same wid horse or fut. A headache if you dhrink, an' a bellyache if you eat too much, an' a heartache to kape all down. Faith, the beast only gets the colic, an' he's the lucky man."

He dropped his head and stared into the fire, fingering his mustache the while. From the far side of the bivouac the voice of Corbet Nolan, senior subaltern of H Company, uplifted itself in an ancient and much-appreciated song of sentiment, the men moaning melodiously behind him:

> "The north wind blew coldly, she drooped from that hour,
> My own little Kathleen, my sweet little Kathleen,
> Kathleen, my Kathleen, Kathleen O'Moore!"

with forty five o's in the last word. Even at that distance you might have cut the soft South Irish accent with a shovel.

"For all we take we must pay, but the price is cruel high," murmured Mulvaney when the chorus had ceased.

"What's the trouble?" I said, gently, for I knew that he was a man of an inextinguishable sorrow.

practices are too evident and too numerous to be denied. Moral precept alone is not a sufficient remedy for the school community, although high principle saves many individuals. The true antidote for idleness is, of course, enforced study; the corrective of harmful weariness is innocent sport and mirth. To this end a sound theory of education has in some measure always enforced the value of the games in which youth delights. It remained for our century and the teachers of our race to appreciate them at their true importance. The intelligent sentiment of America approves of school sports as wise masters encourage and develop them. It is to be feared, however, that the public emphasizes their material rather than their moral results. We all appreciate the health and beauty of the body; few take pains to note how near akin are physical and moral beauty at the time of life when all is plastic, and conviction has not yet hardened into principle.

Nothing could be more deplorable than the confusion which exists in many influential circles between the play of school and that of college or university, the two terms being almost interchangeable among us. There is a wise old conundrum which asks, "What is most like a man?" The answer is, "A great big boy." We all realize the distinction between the boy of ten and the man of forty; the fewest have studied that indeterminate and misty border land which separates the boy of sixteen, seventeen, or eighteen from the man of seventeen, eighteen, nineteen, or twenty. For all our ignorance, it is there, and the theory and practice of university government must reckon with it—one day, tutelage, the next, independence in some direction. This fact underlies the acrimonious controversy of late years about elective or optional studies in the universities. The question in its present form is even wider, for it now embraces the whole sphere of bodily and intellectual and moral activities.

It is not superfluous, therefore, to point out that the conditions of school sport and college sport are essentially different. The school-boy may be and generally is manly, but at bottom he is still a boy; the university student is, fortunately for him, often boyish, but his powers and his duties are those of a man. Underlying the games and contests which the thoughtless start with a certain powers in longevity: Two hours every day in the open air, not less, rain or shine; exercise if possible on horseback or in some other pleasant way, but out-of-doors whatever you do.

Work is work, however we may seek to disguise it, or for whatever end it is done. Recreation is quite another thing, and has its proper place in student life as it has in all lives. Exercise for the mere sake of exercise is a matter of conscience, and any one who has had the opportunity to observe the recluse, young or old, taking his self-imposed "constitutional" with languid and dragging steps, buried in thoughts that belong under the lamp, must admit the painfulness of the duty. It is needless to recall the scene of the playing fields as the antithesis—the eager rivalry, the intense interest, the alertness of body and mind, the breathless endeavor, the joyous shouts of his contemporaries. The one should lead in the class-room; if he does, it is an exception to the rule, however numerous such exceptions are. The others are likely to lead in the great world after the prelude is played. No logic is required to prove a self-evident proposition, and it is useless to plead the cause of college games when their value for recreation and exercise is patent. And when they furnish, in the ambition to excel which they inspire in their votaries, the strongest incentive to regular and regulated gymnasium practice, they are simply priceless in the scheme of wholesome living.

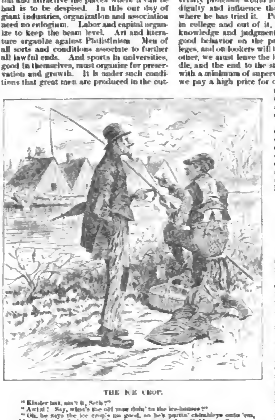
Emulation, rivalry, ambition, are the essence of sport. It might be supposed that within the organization of any college or university the existence of class or school or club feeling would be sufficient to secure quite enough of honorable pride to insure the best results. Experience proves the contrary. So centralized and homogeneous is the life of every great American institution of learning that nothing less than measuring powers with another will arouse sufficient enthusiasm for the leavening of the whole lump. This is even the case with the English universities, where the federal system of separate colleges still survives in splendid activity. It is the final struggle at "Lords" before the great London public which animates the cricketer of Oriel or Christ Church. Visions of the homestretch on the Thames, rather than the bumping races on the Cam and headship in its narrow and sedgy reaches, make the stroke and the discipline of the boating men from Johns or Trinity. How much more stimulating must similar considerations be to the out-door sports of Yale or Princeton or Harvard! New London, Mott Haven, and the Berkeley Oval furnish ideals of glory before which the lesser honors of the Charles River or the university field must pale in their calm and fainter light.

While such considerations appeal to every right-minded man, and are most important in themselves, they are but commonplaces when compared with the educational and moral results of intercollegiate contests. Victory, when nobly won and rightly used, is a splendid thing in itself. So is defeat. Nothing knits souls together like common experience. If a liberal education be desirable, nothing not harmful in itself which makes influential and attractive the places where it can be had is to be despised. In this our day of giant industries, organization and association need no eulogium. Labor and capital organize to keep the beam level. Art and literature organize against Philistinism. Men of all sorts and conditions associate to further all lawful ends. And sports in universities, good in themselves, must organize for preservation and growth. It is under such conditions that great men are produced in the outside world, and the same is true of the college world. Discipline, whether in obeying or commanding, is secured in these contests as by no other possible means. Through them every man in the college finds some place for his energy. The writer has an opportunity in the college journals, the speaker sways the mass-meetings, the man of affairs becomes an organizer, the financier deals with ways and means, the most insignificant in powers of mind can find vent for his unreasoned enthusiasm. The repression and discipline of the class-room and the devotion of the ardent student find their supplement not in spiteful mischief and disorder, as in by-gone days, but in lawful, useful activity.

Young men, emphasize the epithet as you may, are nevertheless men. To a higher degree than their elders they possess enterprise, restlessness, eagerness for doing and acting. They must have an outlet. In former days the outlet was not a safe one. The cow in the college belfry was a nuisance, laugh at the poor old joke as we do; the caricature and the rake gave pain to sensitive minds, and often inflicted wounds which never healed; the town and gown riots were debasing, and often led to criminal violence; the "burial ceremonies" of some despised text-book often developed into vice, and the vices of college students are those of adult passion. Talk about games may be trivial, the athletic hero may be but an absurd hero, though I do not believe it, but such topics and such heroes are noble in comparison with those which they have supplanted.

The man who seeks a college education consciously aims at leadership in some line of the world's work. The fierce scrutiny to which the public subjects his thinking and actions is therefore beneficial. But censoriousness and partiality too often deepen the shadows without heightening the lights of college life. College students surpass in intelligence and morality men of the same age in any other occupation. They ought to do so to a much greater extent than is the case. But no one claims perfection for them any more than for the mature men of any trade or profession. It must be freely admitted that too often their zeal outruns knowledge; that there are abuses in the sacred precincts as in the outer courts. College sports are not free from them. But are they on that account to be undervalued and relegated to the list of nuisances which are to be abolished? By no means. As patriots we want our educated men to be ready for great undertakings, fearless before the most portentous obstacles, versed in human nature, and adroit in the art of politics. There is no better school for the nurture of such qualities than the management of intercollegiate athletics.

The final consideration then is, how should they be conducted, and who should manage them? Of course we want and must have fairness and courtesy. To that end we must have regulations and maxims and a fine tradition. But we also want fire and energy; the fierce joy of struggle, if it must be. In order to have one, we might leave instruction in behavior on the arena where we put instruction in science, or the classics, or philosophy. But it would be a hazardous experiment, and it is to be feared that the university professor would lose still more of his dignity and influence than he has already where he has tried it. Public opinion, both in college and out of it, must be trained to knowledge and judgment; and when it is, good behavior on the part of players, colleges, and on-lookers will be assured. For the other, we must leave the beginning, the middle, and the end to the students themselves, with a minimum of supervision. Sometimes we pay a high price for doing so; but if we are to cultivate the sense for conduct in a most important class of young men, I believe we must do it. We dare not deprive them of either their energy or the invaluable experience which a sense of responsibility to the public alone can give.



THE ICE CROP.

"Kinder hot, ain't it, Seth?"

"Awful! Say, what's the old man doin' to the ice-houses?"

"Oh, he says the ice crop's no good, so he's puttin' chimbleys onto 'em, an' he's goin' ter fix 'em up an' rent 'em fer summer boardin'-houses."

"Gee Whickety! The summer boarders will kick themselves and the chimneys all ter pieces when they get the first month's bill."

ATHLETICS IN BOSTON.

The greatest athletic event of the season took place in the hall of the Massachusetts Mechanics' Association, Boston, Massachusetts, February 13th, when the Boston Athletic Association held their first annual in-door meeting. Invitations to the leading athletic clubs of the country had been sent out some time before, and the result was that about six hundred of the best amateur athletes of America participated in the games. The meeting was the largest of its kind ever held in Boston, and for five hours a crowd of several thousand people watched the struggles of the men. A wooden floor is not the easiest thing in the world to run on, especially when the turns of the track are abruptly made, as was the case at the Mechanics' Hall; and many of the visiting athletes were improperly shod, lacking the spiked shoes necessary to keep the foothold in rounding the sharp corners. Nevertheless, the events were all closely contested, and many surprises were in store for the athletes and visitors alike. The great runner of Princeton, Dohm, was reckoned a sure winner in the half mile run, and won the preliminary heat; but, after defeating his Harvard rival, Downes, in the final he, in turn, was distanced by Peters, of Boston, and Blake, of Harvard, and came in third place. It was another surprise for everybody when a Harvard man won the one-mile handicap run, with an Amherst and Trimount man second and third respectively, and the expected winner, Day, of the New Jersey Athletic Club, failed to get a place. The winners of the various events were as follows: 40 yards dash, E. H. Green, Harvard; half-mile run, F. R. Peters, B. A. A.; 220 yards run, J. T. McNeil, Trimount; mile walk, J. C. Keating, Pastime A. C.; 440 yards run, K. Brown, Harvard; mile run, G. Colamore, Harvard; 220 yards hurdle, J. C. Lally, Pastime A. C.; high jump, G. B. Fearing, jun., Harvard; putting the shot, J. S. Mitchell, N. J. A. C.; hammer-throwing, Coughlin, Titan A. C.; tug of war, Pastime A. C.

Handsome medals and cups were distributed to the victors, and the meeting in every way was declared a success.

THE LATE JOHN JACOB ASTOR.

John Jacob Astor, who died of *angina pectoris* at his home in this city on Saturday last, leaves behind him one of the greatest private fortunes ever accumulated, and a reputation for many excellent qualities of both head and heart. The founder of the Astor family, son of a butcher at Waldorf, in Germany, and himself bred to his father's trade, came to this country in 1783, when twenty years of age. His port of destination was Baltimore, and he brought with him to sell on commission a small stock of musical instruments manufactured by his brother in London. The young man met on shipboard, however, a fur dealer, and impressed with the latter's account of profits to be made in the fur trade, determined to come to New York and enter that business. This was the first John Jacob Astor. He speedily acquired a knowledge of the fur trade in the employment of a Quaker furrier, and set up in business for himself; at the same time he became agent of the London piano-maker for whom he had once worked, and established the first music store in New York. His wife, Sarah Todd, brought him a dowry of $300, and with it a rare fund of good sense. Within fifteen years young Astor had acquired a fortune of $200,000. By hard work in his chosen business and judicious investments in real estate and various securities, he swelled this sum before his death in 1848 to $20,000,000. He left two sons and two daughters. One son, who bore his father's name, was demented; the other, William Backhouse Astor, inherited the father's business and much of his fortune.

William B. Astor, perceiving that immense profits must accrue to land holders through the growth of New York, followed his father's example, and invested large sums in urban property. The first Astor had constantly bought lands just beyond the limit of population, and the son not only imitated him in this, but improved upon his method. As a result, at his death, in 1875, he left a fortune estimated at $150,000,000. His children were John Jacob Astor, who is just dead; William Astor, a man of vast wealth; Henry Astor, who was cut off with $30,000 because of a marriage that displeased his family; and three daughters, who married, respectively, Samuel Ward, Frank Delano, and John Carey.

John Jacob Astor third was born in this city nearly sixty-eight years ago. He received his academic education at Columbia College, but failed of distinction in his collegiate course. After leaving college he passed some years in Europe, where he became proficient in the French and German languages, and saw much of fashionable society. Forty-four years ago he married the daughter of Thomas Gibbs, a cultivated South Carolinian, whose family claims descent from King John of England. Mrs. Astor was a leader of fashionable society in New York, and dispenser of many thousands—perhaps millions—in charity. She died less than two years ago, to the great grief of her husband. The income of her large private fortune he is said to have applied since that time to charity.

John Jacob Astor, following the example of his father and grandfather, invested great sums in urban land. He seldom or never sold real estate, and his leases were usually made for not more than twenty-one years, with ample safeguards as to renewals. This had been the policy of his predecessors, so that now the Astors are by far the greatest individual land owners in New York. The family holdings lie in all parts of the city. They include the Astor House, worth at least $2,000,000; the Schermerhorn Building, facing on Broadway, Pine, and Wall streets; the Exchange Court Building, on Broadway, Exchange Place, and New Street; the Guarantee and Indemnity Building, the Oriole Building, and many others in the down-town business district; besides private dwellings and tenement-houses within the residence portion of the city; and many acres of valuable land miles from the centre of population. It is said that the family owns fully 2500 dwellings within the city limits. The assessment books for the First Ward alone show between $1,000,000 and $1,500,000 worth of property set down opposite the name of Astor, and the family's holdings here are smaller than in several other wards.

John Jacob Astor was not a mere money-getter, though he was known to the public almost exclusively as a man of vast wealth, and his character as a financial magnate perhaps overshadowed for most persons his qualities as a man. His charities, though unostentatious, were large. He gave to the Astor Library, founded by his grandfather, not only over $250,000 in money and land, but much personal supervision, and contributed year by year unknown thousands to a great variety of objects. His tastes were of the simplest sort, and it was only twenty years ago that, in accordance with the wishes of his wife, his great plain brick dwelling-house at the northwest corner of Fifth Avenue and Thirty-third Street was beautified with internal decorations. About that time also he and Mrs. Astor began collecting pictures. Before, the house had been almost bare of art objects, but now it contains a great number of paintings and other beautiful things. Mr. Astor was a student, and in some directions perhaps a scholar. He read much in English, French, and German literature, and at times surprised his friends not only by his familiarity with lighter works of genius, but by his mastery of difficult scientific questions. He was a lover of music, and went much to the opera.

Though Mr. Astor had several country houses, he passed nearly the whole year in New York, and attended to business winter and summer. It was his usual custom to walk down to his office in Twenty-sixth Street about nine o'clock in the morning, attend to business there until noon; walk to his lawyer's office far down town; and about three o'clock in the afternoon walk back to his home. He believed this exercise necessary to his health. He seldom rode in going about the city, even in bad weather, and less often in his own carriage than in public conveyances. In spite of his large charities he was close at a bargain, and he seemed to take pleasure in curious small economies. In telegraphing, for example, it was his custom to prune the despatch down to the fewest words that would convey his message. His social life was in keeping with his simple tastes in other matters.

Mr. Astor was a man of striking appearance. He was six feet tall, ruddy, gray, clear-eyed, and of dignified bearing. His dress was extremely simple. He wore no jewels, but was oddly scrupulous in little matters of attire. He took no active part in public affairs, though he was a stanch supporter of the government during the civil war. He attended the Episcopal Church, and was for many years a vestryman of Trinity.

On the whole, Mr. Astor's life was that of a modest, studious, well-bred man, who apparently found pleasure in preserving and increasing a vast fortune, accepted philosophically many of the onerous duties that great wealth imposes, but gladly evaded the vulgar notoriety and ostentation which it sometimes entails. It is significant of the fortune which he must have left behind that his brother William, who has troubled himself little with business, and given much time to costly pleasures, is credited with being worth seventy millions of dollars.

Although Mr. Astor died of *angina pectoris* he had been a man of unusually robust health up to within less than a year of his death. He was ill of influenza in London some months ago, and was much reduced in strength by reason of the disease. With characteristic thoughtfulness for others, he refused, when seized with his fatal illness on Friday, to have members of the family outside of his own house notified, and his sister-in-law, Mrs. William Astor, sailed for Europe early on Saturday morning without having heard of his death.

The bulk of John Jacob Astor's fortune goes to his son William Waldorf Astor, who will thus become the greatest of New York landholders, and one of the wealthiest men in the world. The secret of the Astor wealth has been so jealously guarded that no trustworthy estimate of it can be made, but William Waldorf Astor falls heir to property worth probably from $75,000,000 to $100,000,000, much of it in land that is more valuable every year, and the remainder chiefly in securities of the safest character. The heir is a tall, handsome, well-educated man, forty-two years of age, and married. His present home is a large but unpretentious house in Thirty-third Street, just east of Fifth Avenue, but he is building at the corner of Fifth Avenue and Fifty-seventh Street what will probably be one of the handsomest of New York homes. He has been twice a member of the New York Legislature, once a candidate for Congress, and during President Arthur's administration was Minister to Italy. In the Italian capital he was distinguished for a magnificent hospitality. Since his return to the United States he has published a successful novel of Italian life.

EY MARKET.

tood that for some time ately since the sudden mperial government in arket has been unusually e money markets of Eu- us by London. A busy London, largely in miscel- strial stocks and South eceived a sudden warning 's unexpected fall caused rs of London to review the speculative position with a closer scrutiny. The final result of the scrutiny was that the Bank of England at the end of December raised its minimum rate of discount to 6 per cent., and that on a Monday, while the usual custom is that changes are made on Thursday, the day of the publication of its weekly statement. To make its policy more effective, the bank charged 7 per cent. for loans upon securities, and 8 per cent. where the loans were larger than usual. The open market rate for discount followed the Bank of England rate very closely, and it is only this week that it fell to 4½ per cent., and pointed the way to a reduction of the bank rate. This morning the Bank of England reduced its rate of discount to 5 per cent., and was able to show £22,911,000 sterling of gold on hand, against £17,782,000 on January 3d, and, what is more important, an increase of the proportion of assets to liabilities in the same period from 37⅜ per cent. to 50 per cent.

Plainly, therefore, the directors of the Bank of England consider that their object has been attained, at any rate for a time; and the opinion here is that speculation has been checked in the manner and the directions intended. It is certain that our securities were not specially aimed at, but the action of the bank necessarily caused large amounts to be sent here for sale, and it is already stated that for two or three days past London has been buying back in this market, and this is corroborated by testimony in the Stock Exchange and the dealings in Foreign Exchange.

In our own market the recent action or policy of the Bank of England has been very influential in checking speculation; it probably had more to do than any other single cause in bringing about the dulness which led to the violent attacks on such railroad stocks as Rock Island and Chicago, Burlington, and Quincy. There was, accordingly, a disposition to think that a reduction in the Bank of England rate would at once revive speculation here, and to-day's business at the Stock Exchange shows the disappointment of those who held this view. The reduction is certainly an important point gained toward the restoration of confidence, and therefore the speculative buying which accompanies that; but it is scarcely fair to expect the situation to show great changes immediately, and moreover the necessity to keep world-wide speculation within bounds still exists. Rich as Great Britain may be, or the leading European nations collectively, they cannot, either singly or united, furnish money to all parts of the world in the amounts asked for at one and the same time. Discrimination is imperatively required, and it is satisfactory to know that our securities are more wanted than those of any other country. This is the case with our so-called international securities, those which are quoted in foreign stock markets as well as here; and we have had evidence to the same effect with regard to many American industries, in which bona fide investments by "English Syndicates" have been made to a considerable extent of late, and even during the existence of the 6 per cent. rate at the Bank of England. It may therefore be fairly claimed that the influence of London on our money market is once more favorable, and in some specialties, Louisville and Nashville for instance, the influence may be important. But the general gain to us is that a great weight has been removed.

As far as domestic considerations are concerned, we are again obliged to look, first of all, to the Treasury, which has in these three weeks taken nearly nine millions of dollars out of the banks. The spring demand for currency for the Western and near by States is spoken of as likely to cause stringency as the 1st of April approaches. But bankers do not seem to attach much importance to this; and the experience of recent years is on their side. The local money centres have grown to be much more adequate than formerly to the local demands of the spring trade and settlements. The Treasury, with its surplus accruing at an average of two millions a week the year round, is the real cause of whatever uneasiness is actually felt. Its present absorption of money will be followed in March by the disbursement of large sums for pensions, $6,000,000 being already set aside for this purpose, and $10,000,000 more to be added before the end of February. The small amount of March interest on the 4½ per cents. will scarcely be noticed; but the larger amount due April 1st on the 4 per cents. is always felt; and Mr. Windom would be doing a public service by paying it out as many days before that date as he can, with instructions to the sub-treasuries to cash the checks and pay the coupons on presentation. It is a case where a few days make a great difference; not so great as at the end of December, but still great enough to warrant early and complete preparation.

So far, then, as domestic prospects go, the near future of the money market is considered reasonably safe. The general business situation is fairly good, and railroad traffics, down to this time, unusually so. In fact, the business of the railroads keeps up to so large a total that it is difficult to understand why the Northwestern roads have made the reductions they have in West-bound rates. These reductions are not yet explained to the satisfaction of people here who are interested in railroad securities, and the ready explanation of stock jobbing has the defect of resembling too closely an "indictment against a whole people." Something more respectable must be involved, if it is only an attempt to pave the way for better methods in competitive business. The decline of Rock Island and C., B., and Quincy also causes uneasiness, though there is no guarantee that the large short interest can be covered without loss. But these partial disturbances will have less weight as the atmosphere of the money market becomes clearer, and to-day's action by the Bank of England gives some assurance that this will happen.

Henry J. Macdonald.

New York, Thursday Evening, *February 20, 1890.*

HE LATE COUNT JULIUS ANDRASSY, THE AUSTRO-HUNGARIAN STATESMAN.
[See Page 167.]

PUT ON THE BRAKES

If you find you are going down hill in point of health. Falling strength, impaired digestion and assimilation are the marks of decline. Check these and other indications of premature decay with the grand vitalizing and restraining tonic, Hostetter's Stomach Bitters. Beginning at the fountain-head, the stomach, the Bitters remedies its inefficiency, corrects its errors, and sets it vigorously at work. The digestive organ is thus enabled to thoroughly separate from the food its nutritive principles, which, the blood assimilating, is enriched. Thus is the system nourished, and, being nourished, strengthened, and abnormal waste of the tissues stayed. Appetite, the power to rest well, a regular habit are also re-established, and the various functions move once more in their natural and healthful groove. The Bitters, moreover, is a specific for and preventive of malarial complaints, rheumatism, biliousness, and kidney troubles.—[*Adv.*]

When two brands of the same sort of goods are selling side by side in the market, one bringing double the price of the other, what is it that enables the former to find sale? Always, because it is worth that much more; because it will wear longer, do better service while it lasts, keep one satisfied with his purchase instead of kicking himself for a fool all the time he has it, be reliable at the sharpest emergency instead of liable to give out just when it is needed most. And the concern dealing in such goods *has* to charge more for them, because it costs more to make them. That is exactly why The Travelers charges more for its Accident Policies than its competitors, why they are worth more, and why it can get more and do a greater business than they despite its higher rates. The rates are the lowest that permanent surety of paying all claims when due will justify. It paid claimants about $1,400,000 in 1887, and has paid them over $15,000,000 altogether. "Moral: Insure in The Travelers."—[*Adv.*]

The U. S. Navy, desiring to buy twenty moderate-priced watches, invited the leading American manufacturers to send watches for trial and rating at the Naval Observatory in October and November last. One hundred and thirty-eight watches of different makes were sent in. It has been officially announced that a Seth Thomas Watch stood first in the trial and the Seth Thomas Watches averaged the best.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

IN 1850
"*Brown's Bronchial Troches*" were introduced, and from that time their success as cure for Colds, Coughs, Hoarseness, Asthma, and Bronchitis has been unparalleled. *Sold only in boxes.*—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures
Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Nicholson's Liquid Bread is essentially a tonic. It assimilates easily with the food and makes pure blood. It is a pleasant substitute for tea or coffee. Ask your druggist or grocer for it.—[*Adv.*]

Blair's Pills.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[*Adv.*]

Use Angostura Bitters to stimulate the appetite and keep the digestive organs in order.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

Avoid Appearances.—A worthy gentleman, having an unusually red nose, was long suspected of being a tippler on the sly, by those not well acquainted with his strictly temperate habits. His unfortunate disfigurement was readily cured by the use of Ayer's Sarsaparilla.—[*Adv.*]

HARPER & BROTHERS, New York.

for any free community to be formally governed and its constitution fixed by a community beyond the ocean, necessarily ignorant of the needs of the dependency.

A certain sentiment of British connection survives in Canada; but the connection is evidently so slight, and mere sentiment as a practical political bond is so shadowy, that in order to save the connection a proposition of closer union with England, under the name of imperial federation, is now made. But a page of trenchant questions in the address reveals the absolute impracticability of such a plan, which is not only intrinsically illusive, but is opposed to the whole modern political tendency, which is not toward centralization but toward self government. While the airy scheme of imperial federation is academically discussed, the connection between British Canada and the United States is constantly closer in every department of industry and interest. "The structure of society, the character of the people, and their social sentiments are the same in British Canada that they are in the Northern and Western States.... British Canada and the United States are now one people under two governments, and with a customs line drawn across it." French Canada is a very different community. It is uneasily federated with its British neighbor, but its loyalty beyond its own borders is to Rome and France, and it yields largely to papal authority. But, like Ireland, it is poor, and its population increases rapidly, and overflows into New England and British Canada.

Will the dual government of British Canada and the United States, which are essentially similar communities, continue always? To this question the address replies that there are influences drawing both ways, but the horoscope of the future must be cast by reckoning the great and permanent forces which determine such problems. The proposition of immediate political union between British Canada and the United States would encounter great difficulties, because it would become at once not a question of real reasons, but a party game and a strife of local interests. It is not easy to determine the actual sentiment of Canada. Goldwin Smith's own opinion is that all along the line in the northwest and in the maritime provinces there is a general inclination for closer union. But this inclination is not deepened by the hostile American tone toward England and Canada. Meanwhile commercial union would be a natural policy for both countries, because if Canada suffers by being out of the commercial pale of her continent, the continent also suffers by her exclusion. Commercial union would involve an assimilation of the seaboard tariffs, but Goldwin Smith thinks that this need not involve the surrender of a sane principle of protection. If the interest of England in such arrangements be considered, "her one real interest on this continent is the friendship of its whole English-speaking race." The calm and friendly tone of this address is indicative of the spirit in which alone the question can be hopefully treated. With the same spirit animating the statesmanship of both countries, the relations of the two English-speaking neighbors could be happily adjusted.

CHICAGO AND THE FAIR.

With all the fun and talk about the Fair, there was little doubt in this city that Congress would award it to New York, and the surprise at the decision for Chicago was universal. Yet many weeks ago we remarked that Congress might not be unwilling to restrain the ardor of the great city, which asserts itself with a lordliness that is not always agreeable to the rest of the country. Moreover, the later incidents of the Fair movement in New York indicated plainly that it had become a political contest, and partisan politics must be necessarily fatal to an enterprise which is essentially non-partisan.

Speculation upon the reasons of the action of the House inclines to regard it as political, and Republican responsibility for the result is warmly alleged by New York Republicans. It is not doubted that the energy and resources of Chicago are equal to the management of a great Fair. But the situation will test the powers of that city to the utmost. For the standard is the late magnificent Fair in Paris—a prodigious display, which cannot be easily surpassed or rivalled.

New York, however, has little local pride, and the result of the vote was received with great general good-humor, although the opportunity was not lost to improve it politically. If Mr. Platt cherishes personal political ambitions, they have not been promoted by his course in this matter. In his zeal for what he amusingly called non-partisan management he has sown seeds of dissension in his party which will bear bitter fruit. The renewed harmony of the dance of the "Big Four" which we chronicled last week was, alas! in vain, and the adjuration that joy should be unconfined has been followed by a sudden cessation of hilarity. The Senate has yet to act, and it is not formally decided that there shall be a Fair; and even if a Fair be authorized, the date may be deferred. The time for contention, however, has passed, and that for hard and united work has arrived.

RELIEF OF THE SUPREME COURT.

There are now 1500 cases awaiting attention on the docket of the Supreme Court of the United States. It will be four years before the last case on the present docket is reached. This year 450 new cases were received, and the Court disposes of about 400 a year. For more than thirty years the business of the Court has been plainly overwhelming it, and the absolute necessity of effectual relief is imperative. Mr. Henry Hitchcock, of St. Louis, President of the American Bar Association, who has made a long and thorough study of the subject, has been recently in Washington, with an eminent committee of the Bar Association, in communication with influential Senators and Representatives, and they anticipate speedy and favorable action.

In 1854 Senator Douglas introduced a bill containing many of the provisions for relief which are now approved. But the two Houses of Congress have never been able to agree upon a scheme. The attention and interest of committees of both Houses, however, have now been secured, and Mr. Hitchcock and his friends have argued the matter with such skill and amplitude of knowledge that much longer delay is impracticable. The Court, members of Congress, and the Bar Association are opposed to the project of increasing the number of Justices of the Court. The whole Court investigates each case, and, as Justice Miller says, works as a team. Consequently it can move only as fast as the slowest.

But the simple and effectual plan approved by the Court and the Bar Association is an intermediate Court of Appeals. A court of final resort for patent appeals would greatly relieve the Supreme Bench. This is the provision of a bill now pending. But it would not alone supply the necessary relief. It is fortunate that the ablest lawyers in the country have made this important movement their own, and that Congress has the benefit in the matter of the wishes of the Bar of the Union.

"GARDEN AND FOREST."

Garden and Forest has now completed its second year, and has maintained steadily the high character with which it began. Its admirable ability as illustrated in discussions of the current public aspects of the subjects with which it deals, as, for instance, the question of forestry, in which public interest is now so general and active, and that of the seizure of Central Park for the Fair, which was agitated last summer, has given it an authority which no other such journal ever enjoyed. Its vigilance in observing and reporting events in every part of the sylvan or horticultural realm makes it an invaluable repository of information. No one who is interested in trees, flowers, landscape gardening, and the whole world of natural beauty but would find *Garden and Forest* a delightful weekly companion. Its arrival is the coming of a wise and intelligent and entertaining friend whose stimulating conversation is of topics that never tire and always refresh—a friend who enables us to live more happily, because more harmoniously with nature.

THE COLLEGE AND THE NEWSPAPER.

President Eliot, of Harvard, recently made a speech in Philadelphia in which he said that more care was needed upon the part of newspapers in the selection of their younger men, and his words received immediate and striking confirmation by a wholly misleading report of his remarks. He was represented as bitterly attacking the press, and especially maligning reporters employed upon the Boston press. But his simple explanation of the speech, which had been grossly misrepresented, was of course conclusive.

Mr. L. Clarke Davis, of the *Ledger*, had made an admirable speech in which he expressed the opinion that colleges did not take interest enough in journalism as a pursuit. President Eliot thought the speech so good that he commented upon it. He said that the true education for an editor was thorough training in writing English, and in history, political economy, and modern languages, and that this training could be secured in any college with an elective course. He therefore saw no need for special schools of journalism. Then he thought that greater care should be taken in the selection of young men for newspaper work, and said that in one year four men who had been dismissed from Harvard for disgraceful offences were immediately employed upon newspapers.

The remarks of the President of Harvard were in the interest of better journalism. It is indeed from conformity to his higher standard of selection that the newspaper force of to-day is much superior to that of the last generation. It is generally an intelligent and cultivated gentleman who now represents a great newspaper, although undoubtedly such facts as President Eliot cites show that there is improvement still possible. And the opportunity is made still more evident by the gross misrepresentation of the report of his remarks.

ADAMS'S "JEFFERSON."

No more valuable historical work has been published in this country than the history of the country during Jefferson's administration by Henry Adams. Mr. Adams is a historical student in the modern sense of intimate and detailed acquaintance not only with the documents, published and unpublished, which directly concern his subject, but with the general history of the time of which he treats, and the relation to it of his particular narrative. This gives his work the true historical perspective and proportion, and makes it what every great historical work really is—a chapter in the history of a time.

Besides this just conception and these essential qualities of the student, Mr Adams has the intellectual insight and temperament which enable him to analyze and judge both characters and events with singular candor and acuteness, and his literary style is both lucid and picturesque. The result is of the highest importance. No student of American history can neglect these volumes without irreparable loss. They are a distinct addition to American literature, and they go very far to refute the assertion that our history, dealing largely with Indian wars and frontier life and material prosperity, cannot be made interesting.

In fact it was during Jefferson's administration, which especially proposed to avoid foreign complications, that we were more entangled in the course of events in Europe than at any other time. The whole story of the Louisiana purchase, of Burr's conspiracy, and of our futile efforts to treat with Spain, England, and France, was never so copiously and clearly told, with ample familiarity with all sources of information, as in these volumes. The estimate of Jefferson's composite character, his abilities and weaknesses, his virtues and inconsistencies, is free from all partisan or other bias, and commends itself as wise and just. Upon a literary work of such admirable quality as this the country is to be congratulated.

PUBLIC SPIRIT IN NEW YORK.

There have been two refreshing illustrations of the public spirit of the city of New York during the last year. One was the prompt and successful opposition to the proposal to seize Central Park for a Fair, and the other is the repeal by the Assembly of the law which authorized the seizure of the City Hall Park for more buildings. They were both of them victories of the press. Except for the resolute and steady opposition of a part of the press to the plan of taking the Park for the Exhibition, under a truculent hurrah that the alternative was the Park or no Fair, the law expressly forbidding such a course would have been disregarded, and a precedent fatal to all pleasure-grounds in the city would have been established.

The same prompt and vigilant persistence against the invasion of the City Hall Park has apparently prevailed, and it may be now considered settled that the parks are to be reserved exclusively for their original and specific purposes—the promotion of the health and pleasure of all the people, and more especially of those who are unable to seek such recreation out of town. The principle that underlies this action is very simple; it is that a park is best promoting its highest purpose when it is maintained solely as a park.

PERSONAL.

The present head of the Shelley family, Sir Edward, a nephew of the poet, is a widower on the shady side of sixty, and lives on the family's beautiful estates in Hampshire, south of England. The house, a red brick structure, was built and lived in by Charles II. Sir Edward, till he settled down in 1868, led a wild career of adventure. Finding the life of a British cavalry officer too tame, at the opening of the Crimean war he joined the Turkish Bashi-Bazouks, and was made a Pasha by the Sultan. Then he hunted in the wilds of South Africa, and afterward came to America to enjoy the rough sport of the Western prairies. The Indians captured and kept him a prisoner for years, making him a chief, but watching him closely till he found an opportunity to escape. Later he travelled in China and Japan.

—The name of John Stephenson, of New Rochelle, is a synonyme for honesty wherever he is known. In 1831 he built the first omnibus ever used in this city, and the following year the first street car. Since then he has constructed hundreds of stages, and nearly all the horse-cars used in this city, the total of the latter reaching above twenty thousand. Although over eighty years old, he remains at the head of the largest street car making concern in the country. He has long been interested in Sunday-school work, and for over forty years was a choir leader.

—Mrs. Phœbe J. Houghton, of North Easton, Massachusetts, the daughter of a Revolutionary soldier, has recently celebrated her hundredth birthday. She remembers distinctly the funeral of President Washington.

—A fine monument to Joan of Arc is to be erected at Vaucouleurs. It will cost a million francs, and the Bishop of Verdun has undertaken to raise the money.

—The manner in which William Walter Phelps has had his new Berlin residence made ready for occupancy is said to have greatly scandalized the conservative Germans. The chief causes of horror were the free admission of light and air, the tearing down of dark paper and heavy draperies, and the substitution for these of light curtains and papers and furnishings of less sombre hues.

—The portrait of Henry M. Stanley is to be painted by Miss E. M. Merrick, the same English artist who went to Cairo to paint the picture of the Khedive. When Mr. Stanley's portrait is finished, he will present it to the Royal Geographical Society. It is said, in connection with other testimonials to Stanley's increased fame, that a Birmingham manager who paid him fifteen guineas the last time he lectured in that town, now offers three hundred guineas, and fears that even this sum will not be sufficient to secure an address from the explorer.

—A new explanation of short-sightedness comes from Breslau, Germany. Dr. Forster, the director of the Ophthalmic University there, declares that in three hundred cases that he has studied the pressure of tight collars upon the muscles of the neck has so disturbed the circulation of the blood as to affect the eyesight.

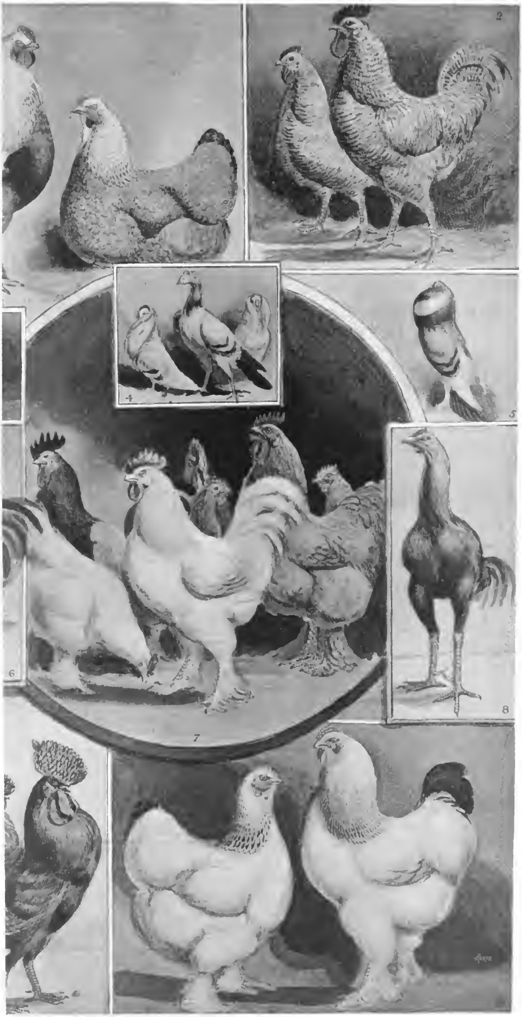
—The historic Quincy farm at Quincy, Massachusetts, which has been owned by the family for a century and a half or more, is to be cut up and a part of it disposed of for building lots. The house, built by Colonel Josiah Quincy in 1770, and under whose roof many prominent men of past generations have been entertained, will not be sold. On a window-pane in this ancient edifice are scratched with a diamond the words: "Oct. 10, 1775. Gov. Gage sailed for England with a fair wind."

—Ex-President Noah Porter, of Yale College, succeeds the late ex-President Woolsey as President of the Phi Beta Kappa Society.

—P. T. Barnum's only regret as he sails back to this country probably is that he cannot bring away with him some of the royalties with whom he has hobnobbed to figure in his great moral aggregation. The £800,000 of British gold that has flowed into his coffers during the trip will, however, help to assuage his grief.

—Squire Massie Beasley, of Aberdeen, Indiana, the Gretna Green of Kentucky, has tied the knot for 4070 couples in the past nineteen years. He has never succumbed to the contagion of romance, however, but remains a bachelor at seventy-three.

—One of the prettiest and most sensible girls in Mount Carmel, Connecticut, Miss Nellie Patterson, has just finished a four years' apprenticeship, and is now earning her living as a full-fledged machinist. She had to make her way in life, so she learned the work for which she had a natural bent. Now she is pronounced as clever and efficient as any workman in the shop where she is employed, while her success has been accomplished without any sacrifice of womanliness.



IE POULTRY SHOW IN THE AMERICAN INSTITUTE BUILDING.—DRAWN BY J. C. BEARD.—[SEE PAGE 179.]

conclusion, since the Roman gate was held by Horatius; and in my admiration of it I shouted until the muscles of my throat were strained and aching. Our boat already was near the wall—having pulled in that the soldiers aboard of it might spear such of the enemy as came up to the surface alive—and we had the three out of the water and safe among us in very short order; and then we pulled away toward the other boats with all possible speed: for the wall now was manned by the enemy, and they were beginning to make things unpleasantly hot for us with the heavy stones which they heaved over the parapet that our boat might be sunk by them, and by a rapid discharge of darts. Luckily none of the stones struck us, and because of the rapid way that we were making only two of our men were struck with the darts. So, on the whole, we came out of this encounter very well; for these two men killed in our boat were all that we lost, while of the enemy at least forty were drowned or speared. However, we owed our light escape mainly to the fact that the enemy, having armed hurriedly, and expecting only to fight with us at close quarters, had with them neither bows nor slings; but for which fortunate fact it scarcely is possible that a single man in our boat would have come off alive.

Dripping wet though they were, I fairly hugged Rayburn and Young when they were safe aboard with us, as did also Fray Antonio—whose daring spirit was mightily aroused by witnessing their splendid bravery. And in giving them hearty words of praise for what they had done—which yet fell far short of their deserts—I naturally likened them to the Roman hero. Indeed, I may say that the parallel that I there drew was an apt one, and in some of its turns was not devoid of grace.

"I can't say, Professor," Young answered, when I had finished, "that I ever heard o' th' party you refer to; but if this Horace—what did you say his last name was?—pinched his fingers in th' drawbridge chains as dumnably as I pinched mine in th' chains of that infernal grating, I'll bet a hat he was sorry that he hadn't run away!" And I truly believe that Young thought more about his pinched fingers than he did about the resolute bravery that he had shown in finishing his work upon the wall in the very face of the advancing enemy.

Being once out of range of the darts, we pulled toward the other boats leisurely; for now we were entirely safe against pursuit, and were free to go upon the lake in whatsoever direction we pleased. That some positive line of action had been determined upon was evident; for the flotilla already was in motion as we came up in the rear of it—the boat containing the members of the Council leading—and the order was passed back to us that we should follow with the rest. From the direction in which we were heading, Tizoc inferred that we were bound for the only other considerable town in the valley—that which had grown up around the shafts leading to the great mine whence the Aztlanecas drew their supply of gold. There was a very grave look upon his face as he told us of our probable destination; and presently added that the population of this town—save the few freemen who were in charge of the workings, and the large guard of soldiers that always was maintained there—was made up wholly of Tlahuicos who had been selected from their fellows to be miners because of their exceptional hardiness and strength.

It was among these men, he went on to tell us, speaking in a low, guarded voice, that the most dangerous of the revolts of the Tlahuicos invariably had their origin; for the miners were fierce, half-savage creatures, naturally turbulent and rebellious, and were stirred constantly to resentful anger because of the life of crushing toil that they were condemned to lead. So dangerous were they that the only effective means of keeping them in subjection was to hold the major part of them continually prisoners underground in the mine, with a guard stationed at the mouth of each shaft under orders to kill instantly any man who attempted to come forth from the mine without authority. In order that their labor, a thing of positive value, might not be lost through their dying of being thus imprisoned in the bowels of the earth, they were divided into ten great companies; each one of which, in regular order, was employed in the surface work, under the constant supervision of a strong guard. Yet even these stern measures were not wholly effective in preventing mutiny. Many times great revolts had broken out here that had set all the valley in an uproar, and that had been crushed only after pitched battles had been fought between the rebels and the entire military force of the state. The town was a veritable volcano, Tizoc declared; and because of the dread of it that universally obtained by reason of the frequent outbursts there of lawless violence, it had received the name of Huitzilan, the Town of War.

And there could be no doubt, he added—while the tones of his voice and the look upon his face showed how great he believed to be the risk involved in this line of policy—that in now directing our course toward the mining town the deliberate purpose of the Council was to invite these semi-savage, wholly desperate miners to join forces with us in our rising against the Priest Captain's power.

[TO BE CONTINUED.]

A STIR IN CHICKENDOM.

Ever since last November the inner circles of Chickendom have been all agog over the great New York show. A tiny sheet, called *Show-Room Squibs*, has been sent out monthly, giving full information as to the progress of the arrangements, and no stone was left unturned to make the show a great success, both for the management and also (sometimes a quite different thing) for the exhibitors. The American Institute Building proved an ideal place, and the arrangements were perfect. There was ample room, yet the 2282 entries, disposed in long solid lines of neat wire coops surrounded by the fine pens devoted to breeding yards, and these in turn by the incubators and brooders, and the poultry papers on the broad platform around the outside, filled the main hall very comfortably. The basin around the fountain in the centre was partly floored just above the water, and, surrounded and divided into compartments by netting, and trimmed with evergreen, made a congenial home for the water fowl. In fact, the only thing that was not under perfect control was the crowing of the rival cocks.

Besides the usual regular premiums there were countless specials, those in the pigeon classes alone amounting to nearly $400, while those for the other classes counted up nearly $1000 more. The largest specials were in the light Brahma classes, and as these premiums are always eagerly striven for, the offerings called out strong competition. There were 124 entries, including birds from New York, New Jersey, Connecticut, Rhode Island, Massachusetts, and even from Ohio. All these aside from the numerous pens offered for sale. So large and fine an exhibit is seldom seen. The competitive show of the lordly dark Brahmas embraced some 40 specimens. The specials for these included one of $50 in gold for the best display of dark Brahmas at the show, offered by L. Waterbury, of New York city; yet it was noticeable that all the birds exhibited, except two, belonged to two men—the one an officer of the society, and the other one of the judges.

The very large entry of beautiful though unwieldy buff Cochins, 121 in all, included 47 pullets. The well-grown pullets are always the finest birds at any show or in any breed, and this class was made specially attractive by the large number of these, and specially interesting by the presence of two huge cocks from England, valued at $200 each, which had feathers enough for a small pillow on their legs alone, they being full-feathered for their entire length. These birds, and, indeed, those of all the large breeds, are bred nowadays with *two pairs of wings*—one pair on their bodies, the other on their feet—yet, strange to say, they fly with extreme difficulty.

There were some 80 entries of black Langshans, including one from Illinois valued at $50. White Langshans showed 15 entries, most of which were from Passaic, New Jersey. The names of the chief actors in the late bitter controversy about this breed appeared in the catalogue with but a single exhibit each. This is one of the newest breeds, and its characteristics are not yet well fixed. The strife has advertised it well, but whether to its advantage or its detriment remains to be seen.

The three other breeds which are hailed as new on this side the water are the Indian games, the red caps, and the black Orpingtons. The attempt to boom these last does not seem to have amounted to much here as yet, as they did not materialize at all, no specimens being entered. The red caps were represented by 20 specimens, all but two from Lockport, New York. This is a handsome breed, but the great cap of a comb is little improvement over the single comb of the brown Leghorn, which they much resemble. Aside from their awkward, long-legged shape, there were no handsomer utility fowls at the show than the Indian games, of which specimens were shown, most of them from the Lockport red cap man. There were also a number from Long Island, 3 entries from Elmira valued at $50 each, and 5 from Scotland, Europe.

The late greatly revived interest in the barred Plymouth Rock was helped along by $120 in specials offered, and attested to by the presence of 120 specimens, mostly cockerels and pullets, and many of them extremely fine. No bird better combines utility and beauty.

The four varieties of Wyandottes—silver, golden, black, and white—showed in all 190 entries. The highest silver-laced cockerel scored, if I remember rightly, but ninety-two and a half points, due, no doubt, to the fact that it is a most difficult breed to get true to feather. Those of the golden variety shown would almost have done to photograph for ideal specimens. The whites were very numerous. They are having a special boom because of their adaptability (from color and shape) to make fine broilers.

The best Leghorns in the country were on hand, and the great popularity of these breeds was shown by the more than 200 competing specimens. In single-comb browns Rahway, (New Jersey), Waterville, East Chatham, and Owego (New York), were specially noted. There also were several fine whites from Fabius, New York.

Black Minorcas came largely from Fabius, New York, but a few high-priced ones were from Scotland. Whites were conspicuous by their absence, none being entered.

White-crested black Polish were noticeable both for number and beauty, most of them being from New York State. Some from Afton, New York, showed crests as evenly combed back as a fashionable lady's Pompadour.

The secretary showed some fine buff Pekin bantams, valued at from $18 to $20 each, and a young lady from Brooklyn showed two specimens, valued respectively at $100 and $150.

There was a light display of eggs and dressed poultry for competition, utility evidently not being a high card; but the assembled hens, learning that the eggs laid on the spot would be devoted to the New York Hospital, passed a majority resolution to shell out.

Six makes of incubators were in competition, three of them on largest hatch at the show. One man made a showing of 250 ducks and 150 chicks from a total of 480 eggs brought to the city in his trunk, and the brooders were full of small fry, and the machines piled high with shells. Ducklings were offered for sale at 50 cents each, and chicklets at 25 cents.

There was a fine lot of Chinese golden pheasants at $30 per pair, and the pigeons were wonderful in beauty and variety, being shown in 180 different classes. Numerous fine carriers were noted, both black and dun, at prices ranging from $50 to $150. Most of these were owned in New York city. Some noticeable yellow pied pouter cocks were from Lawrence, Massachusetts, and a fine red pied pouter from Scotland. There were some fine black Jacobins from Montclair, New Jersey, and one also from Scotland, and a few yellow Jacobins from Glen Riddle, Pennsylvania. About the prettiest sight at the show, however, was the flocks of white and yellow fantails. One pen of twenty whites in a prominent position was in constant motion, that made one think of white-caps in the sunshine. The effect was indescribably beautiful.

In the sales department there were 74 offerings, one pen of buff Cochins being valued at $400, and another at $250. One of Plymouth Rocks was also held at $250.

The numberless appliances on sale and the shower of circulars seemed to prove that there is plenty of money in the poultry business for those who know how to handle it. Patent water dishes, brooders, etc., were in abundance, and the newly invented clover cutter was on hand, ready "to fill a long felt want."

C. S. Valentine.

THE RACKET-COURT.

Rackets is essentially a masculine game. Whereas it is among the possibilities that a woman may make a fair lawn-tennis player, it is doubtful whether she could ever become proficient in the racket-court. It is not so much physical strength that is necessary as a call upon the player for the greatest degree of activity. A man to master the game must be as agile as a panther, and to a quick eye annex judgment with skill in the handling of his racket. It has, however, this great advantage over lawn tennis. It is a game which is easily comprehensible. The tyro at once understands the method of serving, the way of counting, and in a short time appreciates the skill of the performers.

There is no such thing as dawdling at rackets. The good player, the instant the ball is served, must know intuitively where it will land. The man with a slow personal equation can never hope to become more than a commonplace performer. The exercise is a strong one, then, and made for men. The blow imparted to the ball requires not so much main strength, but it must be sharp and quick, and delivered with precision. To be all over the court, and to take the ball on the racket and impart a new impulse to it, require a rapidity of movement in which the legs are the great factors.

There is no game which brings more in prominence the distinguishing qualities of the athlete. It is the type not of a passive but an active sport, where elegance of movement and rapidity are combined. The fumbler and potterer score no aces. As to the real pleasure in it, a game of rackets between two such fine performers as Mr. Albert Wright, of the New York Racket Club, and his clever Boston adversary was nothing short of an hour of excitement from opening to finish. The peculiarity of the game can be at once understood when the character of the ball is explained. Taking the cricket ball as the Brobdingnagian type, the racket ball is Lilliputian. It is a little sphere covered with white leather just one and five-sixteenths of an inch in diameter, and weighs three-quarters of an ounce. When this is struck with a catgut-covered racket, the catgut strung as tight as a piano wire, and this racket twenty-four inches long, and wielded by a muscular arm, the rapidity of the flight of that three-quarters of an ounce ball would surprise even a base-ball player accustomed to a hot delivery. The little white ball shoots like a tiny meteor.

The court is 63 feet long by 31½ feet wide, and is surrounded by walls 28 feet high. The pavement is either of cement, asphalt, or made with flagging. The walls are of brick covered with a smooth hard cement. On the front wall, against which the balls are served, there stretches a black line, ten feet from the floor; and when the ball is started or served, it must strike above it. On the base of this wall there is fastened a plank of wood painted black. When a ball is hit there, it does not count. It is called the "tell-tale," for the balls invariably go with such momentum that when they strike this board they make themselves heard at once.

Appreciating the fact that rackets are played between four walls in a certain confined place, we have a game where the ball sent by the player against the front wall may rebound and strike not the floor but the side wall, and even be carried then with another rebound toward the back wall, to be picked up on its rapid flight forward again by the adversary. Now it can be seen how quick must be the movements of the player in order to follow the minute ball in its eccentric flight.

At the New York club the courts are painted of a deep terra-cotta brown. Colors of courts vary, however, for in India they are white, and the balls are covered with black leather. It is a game requiring the best of light, with no false glares. To be counted among the oldest games, always played in England, it is now enjoying a renaissance in the United States. From the clubs now existing in New York, Boston, and Philadelphia as centres, it is believed that a love for rackets will emanate. At the match held last week at the New York Racket Club the merits of the game were manifest. If the palm of victory is to-day held in New York by Mr. Albert Wright, how long it will remain here no one can say. Skilled amateurs in all the various clubs are numerous. In the courts of the New York club the tiny ball is always whizzing, and the rattle of it as it strikes the telltale, with the clatter of the racket, is constantly heard.

IN-DOOR BASE-BALL.

Next to sailing a yacht race in-doors, the playing of base-ball in-doors appears at first sight about the most ridiculously impossible form of diversion one could conceive of. But this is a fast age; and it would be hardly safe to say for certain that during the next ten or twenty years yacht races may not be sailed under glass and before a grand stand. Certainly base-ball has been tamed.

In-door base-ball has not the slightest resemblance to parlor croquet; neither does it bear exactly the same relation to the normal game that roller skating bears to skating on ice. It is more genuine than either of those, and has come now to be recognized as a legitimate form of winter sport.

The playing of base-ball takes room—lots of it—consequently it is only in some such immense hall as that of the Seventh Regiment in New York, or that of the Thirteenth Regiment in Brooklyn, that the sport can be enjoyed. The accompanying illustration shows one of the regimental games at the Brooklyn armory in progress. These games have been kept up all winter. The companies have got up a regular "league" among themselves, with a schedule and a pennant, and the whole paraphernalia. Companies H and K have been ahead most of the time. The cadets are well up on the list, and at one time threatened to beat all their elders.

This game is one of the almost countless recreations or forms of activity that have been made possible by the electric light. A few years ago such a thing would have been utterly impossible. Base-ball by gas-light or candle-light might send a few patients to the hospital, but it could never be a recreation for anybody, or a pleasure to either players or spectators. When the light is dim or imperfect it is impossible to "judge" a ball. It reaches you sooner than you expect, and accuracy in catching is out of the question. With the electric light, however, all is different. Players still have some difficulty in "judging" balls, and at first there are a great many "muffs" and "fumbles," but the eye soon becomes accustomed to the new conditions. Whether one could play equally well both out-doors and in-doors the same day or week is doubtful.

The armory games are very welcome as a winter diversion, and that for many reasons. In the first place, they can be played in the evening—the only spare time most of the young militiamen have. Even in the summer they can play very little base-ball, because of the lack of time. During the Saturday half-holiday season they have a chance; and every Saturday afternoon Prospect Park fairly swarms with ball-players; but this opportunity of playing in the evening is just what was wanted. In the second place, this is a good winter sport. In summer it would be too hot to play ball in-doors by the electric light. Again, these games afford players a chance to keep in practice during the "off" season. They help to raise the *esprit de corps* of certain companies. They promote good-fellowship in the regiment. They help to develop the physique of a number of young men.

There is always, of course, the danger that any new sport will be overdone—as roller-skating was for instance. But the officers of the Thirteenth Regiment are not likely to allow the base-ball mania to go so far as to interfere with the regular regimental work; nor are they likely to forget that the militia is organized for military purposes primarily, and not necessarily for athletic sport at all.

barricks."

"An' the same is a cess-pit," said Mulvaney, piously. "She spoke thrue, did Dinah. 'Twas this way. Talkin' av that, have ye iver fallen in love, sorr?"

I preserved the silence of the damned. Mulvaney continued:

"Thin I will assume that ye have not. *I* did. In the days av my youth, as I have more than wanst tould you, I was a man that filled the eye an' delighted the sowl av women. Niver man was hated as I have been. Niver man was loved as I—no, not within half a day's march av ut. For the first five years av my service, whin I was what I wud give my sowl to be now, I tuk whatever was widin my reach an' digested ut, an' that's more than most men can say. Dhrink I tuk, an' ut did me no harm. By the hollow av hiven, I cud play wid four women at wanst, an' kape thim from findin' out anything about the other three, and smile like a full-blown marigold through ut all. Dick Coulhan, of the battery we'll have down on us to-night, could dhrive his team no betther than I mine, an' I hild the worser cattle. An' so I lived an' so I was happy, till afther that business wid Annie Bragin—she that turned me off as cool as a meat-safe, an' taught me where I stud in the mind av an honest woman. 'Twas no sweet dose to take.

"Afther that I sickened awhile an' tuk thought to my reg'mental work, conceiting mesilf I wud study an' be a sargint, an' a major-gineral twinty minutes afther that. But on top o' my ambitiousness there was an empty place in my sowl, an' me own opinion av mesilf cud not fill ut. Sez I to mesilf, 'Terence, you're a great man an' the best set up in the reg'ment. Go on an' get promotion.' Sez mesilf to me, 'What for?' Sez I to mesilf, 'For the glory av ut.' Sez mesilf to me, 'Will that fill these two strong arrums av yours, Terence?' 'Go to the devil,' sez I to mesilf. 'Go to the married lines,' sez mesilf to me. 'Tis the same thing,' sez I to mesilf. 'Av you're the same man, ut is,' said mesilf to me. An' wid that I considhered on ut a long while. Did you iver feel that way, sorr?"

I snored gently, knowing that if Mulvaney were uninterrupted he would go on. The clamor from the bivouac fires beat up to the stars as the rival singers of the companies were pitted against each other.

"So I felt that way, an' a bad time ut was. Wanst, bein' a fool, I went into the

cav'lryman, for the sake av the spurs to jingle.

"I wint out to think, an' I did a powerful lot av thinkin', but ut all came round to that slip av a girl in the dotted blue dhress, wid the blue eyes an' the sparkil in them. Thin I kept off canteen, an' I kept to the married quarthers or near by on the chanst av meetin' Dinah. Did I meet her? Oh, my time past, did I not, wid a lump in my throat as big as my valise, an' my heart goin' like a farrier's forge on a Saturday mornin'? 'Twas 'Good day to ye, Miss Dinah,' an' 'Good day t'you, corp'ril,' for a week or two, an' divil a bit further could I get, bekase av the respect I had to that girl that I cud ha' broken betune finger an' thumb."

Here I giggled as I recalled the gigantic figure of Dinah Shadd when she handed me my shirt.

"Ye may laugh," grunted Mulvaney. "But I'm speakin' the trut', an' 'tis you that are in fault. Dinah was a girl that wud ha' taken the imperiousness out av the Duchess av Clonmel in those days. Flower hand, foot av shod air, an' the eyes av the mornin' she had. That is my wife to-day—ould Dinah, an' never aught else than Dinah Shadd to me.

"'Twas after three weeks standin' off an' on, an' niver makin' headway except through the eyes, that a little drummer boy grinned in me face when I had admonished him wid the buckle av my belt for riotin' all over the place. 'An' I'm not the only wan that doesn't kape to barricks,' sez he. I tuk him by the scruff av his neck—my heart was hung on a hair-thrigger those days, you will understand—an', 'Out wid ut,' sez I, 'or I'll lave no bone av you unbruk.' 'Speak to Dempsey,' sez he, howlin'. 'Dempsey which,' sez I, 'ye unwashed limb av satan?' 'Of the Bob-tailed Dhragoons,' sez he. 'He's seen her home from her aunt's house in the civil lines four times this fortnight.' 'Child,' sez I, dhroppin' him, 'your tongue's stronger than your body. Go to your quarters. I'm sorry I dhressed you down.'

"At that I went four ways to wanst huntin' Dempsey. I was mad to think that wid all my airs among women I shud ha' been ch'ated by a basin-faced fool av a cav'lryman not fit to trust on a mule thrunk. Presintly I found him in our lines—the Bobtails was quartered next us—an' a tallowy, top-heavy son av a she-mule he was, wid his big brass

duckin' her little head down on my sash (I was duty for the day), an' whimperin' like a sorrowful angel.

"Now a man cud take that two ways. I tuk ut as pleased me best, an' my first kiss wid ut. Mother av Innocence! but I kissed her on the tip av the nose an' undher the eye, an' a girl that lets a kiss come tumbleways like that has never been kissed before. Take note av that, sorr. Thin we wint, hand in hand, to ould Mother Shadd like two little childher, an' she said it was no bad thing, an' ould Shadd nodded behind his pipe, an' Dinah ran away to her own room. That day I throd on rollin' clouds. All earth was too small to hould me. Begad, I cud ha' picked the sun out av the sky for a live coal to me pipe, so magnificent I was. But I tuk recruities at squad drill, an' began wid general battalion advance whin I shud ha' been balance-steppin' 'em. Eyah! that day! that day!"

A very long pause. "Well?" said I.

"It was all wrong," said Mulvaney, with an enormous sigh. "An' sure I know that ev'ry bit av ut was me own foolishness. That night I tuk maybe the half av three pints—not enough to turn the hair of a man in his natural senses. But I was more than half drunk wid pure joy, an' that canteen beer was so much whiskey to me. I can't tell how ut came about, but *bekase* I had no thought for any wan except Dinah, *bekase* I hadn't slipped her little white arms from me neck five minutes, *bekase* the breath av her kiss was not gone from me mouth, I must go through the married lines on me way to quarters, an' I must stay talkin' to a red-headed Mullingar heifer av a girl, Judy Sheehy, that was daughter to Mother Sheehy, the wife av Nick Sheehy, the canteen sergint—the black curse av Shielygh be on the whole brood that are above-groun' this day!

"'An' what are ye houldin' your head that high for, corp'ril?' sez Judy. 'Come in an' thry a cup av tay,' she sez, standin' in the doorway.

"Bein' an ontrustable fool, an' thinkin' av anythin' but tay, I wint.

"'Mother's at canteen,' sez Judy, smoothin' the hair av hers that was like red snakes, an' lookin' at me corner-ways out av her green cat's eyes. 'Ye will not mind, corp'ril?'

"'I can endure,' sez I. 'Ould Mother Shee-

talk nonsense to your mother. Get her to bed, girl.'

"'Nonsinse?' sez the ould woman, prickin' up her ears like a cat, an' grippin' the table-edge. 'Twill be the most nonsinsical nonsense for you, ye grinnin' badger, if nonsinse 'tis. Git clear, you. I'm goin' to bed.'

"I ran out into the dhark, me head in a stew an' me heart sick, but I had sinse enough to see that I'd brought ut all on mesilf. 'It's this to pass the time av day to a panjandhrum av hell-cats,' sez I. 'What I've said an' what I've not said do not matther. Judy an' her dam will hould me for a promust man, an' Dinah will give me the go, an' I desarve ut. I will go an' get dhrunk,' sez I, 'an' forget about ut, for 'tis plain I'm not a marryin' man.'

"On me way to canteen I ran against Lascelles, color-sergint that was, av E Comp'ny—a hard, hard man, wid a torment av a wife. 'You've the head av a drowned man on your shoulders,' sez he, 'an' you're goin' where you'll get a worse wan. Come back,' sez he. 'Let me go,' sez I. 'I've thrown me luck over the wall wid me own hand.' 'Then that's not the way to get ut back again,' sez he. 'Have out wid your throuble, ye fool-bhoy.' An' I tould him how the matther was.

"He sucked in his lower lip. 'You've been thrapped,' sez he. 'Ju Sheehy wud be the betther for a man's name to hers as soon as she can. An' ye thought ye'd put the comether on her. That's the natural vanity av the baste. Terence, you're a big born fool, but you're not bad enough to marry into that comp'ny. If you said anything, an' for all your protestations I'm sure ye did—or did not, which is worse—eat ut all. Lie like the father av all lies, but come out av ut free av Judy. Do I not know what ut is to marry a woman that was the very spit av Judy when she was young? I'm gettin' old, an' I've larnt patience, but you, Terence, you'd raise hand on Judy an' kill her in a year. Never mind if Dinah gives you the go, you've desarved ut. Never mind if the whole reg'mint laughs at you all day. Get shut av Judy an' her mother. They can't dhrag you to church, but if they do, they'll dhrag you to hell. Go back to your quarthers an' lie down,' says he. Thin, over his shoulder, 'You must ha' done with thim.'

"Next day I wint to see Dinah, but there

tary, but the sp
purpose and probably will continue to be for some time to come. Many of the causes which influenced Congressional action will long be matters of dispute. Chicago's efforts, however, were characterized by the energy and alertness that have long distinguished its citizens. As in New York, a mass-meeting was held, a temporary organization formed, and various committees selected. Funds in the amount of $4,499,530 were subscribed, and two per cent. of the sum paid in. Further money was advanced by men having enough confidence in the movement to take the risk of repayment. Probably over $400,000 was placed at the disposal of the workers.

Among the committees formed was one for the conduct of the campaign for legislation and one on "National Agitation." The last named committee is the peculiar product of Chicago genius. It occupied a field that New York neglected. These two committees performed their duties with particular ability. Congressmen were personally visited at their homes, the aid of influential people was sought by enlisting their interests if necessary, and resolutions without number were secured from boards of trade or other organizations in all the small cities and towns that could be induced thus to testify their allegiance to the metropolis of the West. The title which the newspapers throughout the United States have with much unanimity bestowed upon the men who are prominent in the enterprise is that of "Hustlers." Portraits of a number of them are presented in this issue of the Weekly, and their countenances do not belie their reputation for activity. However arduous the exertions by which these gentlemen have gained their spurs, the business of overcoming the difficulties before them is still more so. Chicago has yet to make the requisite pecuniary provision, fix upon the site, erect the necessary buildings, and attend to all the vast detail connected with the exhibits, domestic and foreign. It has assumed the responsibility of fulfilling the expectations of the nation and of the world, with the recent splendid success at Paris as a standard for comparison.

The hardest obstacle to be overcome is that of obtaining the money. It is asserted that none can be secured by the issue of municipal bonds, as had been provided for in New

manner in which it
discharge the enormous responsibility before it arrests the attention of the world. With less than a third of the population that is collected within eight miles on all sides of New York City Hall, with an immense outlay of some $15,000,000 to make at its own risk, it ventures to supplant New York, to rival Paris and London, and sustain the credit of the nation in the matter of a World's Fair to be held so early as 1892.

THE ASTOR HERITAGE.

In the portrait of William Waldorf Astor in this issue of the Weekly our readers may study the features of one who is in all probability the richest man of the civilized world to-day. The face is essentially one of force and character, and though less rugged than were those of his progenitors, it maintains that strength of feature which marks the race. Mr. Astor's personality is that of a strikingly handsome man. His face, aside from its strength, is decidedly pleasing; the eyes are blue, and well match a light complexion somewhat florid in tone; his hair is of that undecided hue commonly called sandy, and a mustache of the same color partly hides a well-formed mouth. He is more than six feet tall, and straight as a grenadier; his shoulders are square and well set, betokening a physique of large muscular resource, in movement he is quick and energetic, almost to abruptness.

Though his family have long been the social magnates of the metropolis, William Waldorf Astor has not cut much of a figure as a "society man." While properly regardful of the requirements of his position as the prospective head of the great Astor family, the duties it has imposed upon him have been irksome in the extreme at times. His habits of thought and ways of life have been those of the student and man of affairs. Like his uncle, Mr. William Astor, he has delegated his social duties almost entirely to his wife, a very beautiful woman, the daughter of a distinguished Philadelphia family, whom he married almost fifteen years ago. Though a member of the Union, Knickerbocker, and Union League clubs, Mr. Astor is rarely seen about the houses of any of them.

The estate left by John Jacob Astor has been variously valued in the newspapers,

almost invariably
in no way detrimental to each in his class.

It is said that so far back as 1810 John Jacob Astor was the largest real-estate holder on Manhattan Island. If this could have been true, which is doubtful, he certainly showed a wonderful ingenuity in hiding the fact of his possessions from the tax-gatherer, for in 1813 his name appears on the records as the holder of but $20,000 worth of real estate, assessed value. When, on his death, in 1848, the estate was turned over to William B. Astor in trust for the latter's two sons, it was estimated to be worth $20,000,000. This was probably an exaggerated figure, just as have been some of the recent estimates of the last John Jacob's wealth. By far the greatest additions to the Astor wealth have occurred since the death of William B. Astor in 1875, the extraordinary enhancement of real-estate values in and about New York city during ten years past alone making this possible. If such a thing could possibly be determined authoritatively, it would be found that the family wealth under the stewardship of the late John Jacob Astor had, in ratio of increase, far outstripped the results of his father's management. This fact, granted it be true, is no extraordinary testimony to his perspicacity, as he had simply to exercise the common-sense with which he was so well endowed in carrying out the policy enunciated by his grandfather and faithfully continued by his father.

He has been a purchaser, in a quiet way at private sale, of large blocks of urban and suburban property, and his acquisitions have extended into that part of Westchester County along the line of the new parkways which will sooner or later be absorbed by annexation into the city proper. The effect of a purchase by the Astors in any neighborhood has been to enhance the values of all contiguous property. The executors of a large landed estate in the annexed district had much difficulty a few years back in disposing of enough of their holdings at $1000 an acre to pay interest and taxes on the rest. A large block of land was purchased by John Jacob Astor immediately adjoining them, and within twelve months of his purchase their own property was commanding $1000 a lot twenty-five by one hundred feet. The same result followed on the acquirement by the Astors of a large block of waste and
land from the Morris estate along

portrait accompanies this. This burden of wealth has come upon William Waldorf Astor in the early vigor of his manhood. He has mingled more freely with men of all classes than either of his predecessors, and the experience thus gained should place him more *en rapport* with humanity at large.

His father and grandfather inherited, each in his turn, long after passing the prime of life, and when they had acquired that perfect poise of discretion that mature years alone can bring. For years before inheriting, their fathers had instilled into them a line of policy to be pursued, and upon their succession the duties involved were but little more than routine. The new administrator inherits vaster wealth than probably two of his predecessors ever dreamed of; he also meets social conditions such as no one of them understood or perhaps even anticipated. In carrying out the details of management Mr. Astor will have the services of Abner H. Bartlett as "man of affairs." Mr. Bartlett is now serving the Astors in the third generation, which fact alone speaks volumes in testimony of his ability and integrity.

In the centralization of immense real-estate interests that of the Astor estate is probably the most wonderful instance in the world, excepting perhaps that of the Duke of Westminster, in the city of London. Which of the two estates is the more valuable is a problem that can be settled by the principals themselves only, but it is very doubtful if the Duke could climb up into a high tower and through an ordinary field-glass gaze upon one hundred millions of dollars' worth of his own property all lying within a radius of ten miles from his point of observation. Yet that is what William Waldorf Astor can do, if he should choose to climb up into the observation tower on the old aqueduct at High Bridge.

Scott Thompson.

BILLIARDS.

The great billiard tournament at Chickering Hall which closed on Saturday night furnished abundant evidence that the graceful and scientific pastime still maintains its place as "the gentleman's game." the 6 by 12 table, the size of the balls, and the height of the cushions, it requires not a little skill, strength, and hard work successfully to accomplish carroms on that immense stretch of baize. The largest run made was 6—a contemptible bagatelle now, but it made a record then. Billiards did not flourish, however, as a public amusement, the betting on the games appearing to form a stronger feature of excitement than the playing. The greatest game of this character occurred in the spring of 1859, when Michael Phelan and John Seereiter played in Detroit for $7500 a side. Thousands of dollars were waged on the result outside of the prize money. The game was four-ball carroms on a 6 by 12 four pocket table.

The first step taken toward making billiards a game worthy the skill of great experts was when what is known as the American game of billiards was established by a tournament at Irving Hall, April 28, 1869, and the presentation by Phelan & Collender of the famous championship emblem, "the diamond cue." Almost up to that time the massé shots were unknown, and the "shove" shot was in vogue among the experts—a species of carrom that the veriest young tyro would scorn to count to-day. Fabulous runs were made at times by the great players of the day through "yawing" the balls, *i. e.*, wedging two object balls in the jaw of a pocket, so that carroms could be made *ad lib.*

The new American or four-ball game abolished these crudities and developed further the extreme delicacy of touch and the intuitively mathematical judgment of position play necessary for a high order of skill. The game was played on a 5½ by 11 four-pocket table. The cue was won by John Deery. To obtain permanent possession of the bauble, the champion was to maintain his position for two and a half years. The cue afterward passed successively to A. P. Rudolphe, Frank Parker, Cyrille Dion, Maurice Daly, Albert Garnier, and thence to Cyrille Dion again, who became the permanent owner, winning the final game of its history in 1876, his average in the last game being 40⅘, the largest ever made in the history of the "diamond cue" series of games.

The "diamond cue," by the way, had a rather ignoble career afterward. After Cyrille Dion's death, it passed into the possession of a Broadway shopkeeper as security for a loan, and for a long time ornamented a Sixth Avenue shop window. It finally became the property of a well-known book-maker. This cue was the most distinct trophy of championship that billiards has ever had. Its workmanship is exceedingly artistic.

Public interest in the American game began to wane about 1870, a fact probably largely due to the conditions which decided the ownership of the cue, and attention began to be more strongly directed to the French carrom or three-ball game, the adoption of which also marked the disuse of pockets in billiard tables proper.

The first tournament was held in this city in June, 1878, the size of the table being 5 by 10, which is still the size for championship games. Its adoption as the standard game made the French players Garnier, Vignaux, and Ubassy conspicuous in this country, and ultimately led to international contests after they had returned to their native land. When a run of 118 was made in the first tournament, it was considered remarkable, and for days furnished the theme for extraordinary comment and wonder. For several years the game was highly regarded by the public; but the experts gradually acquired complete mastery of its earlier difficulties, and developed the famous "rail" nursing, until a player could "run out" a game of several hundred points in a few innings. Vignaux, in the international game with Slosson in Paris in 1880, made the quota of 800 points on the fourth night without giving the American a chance at the table.

As public interest diminished, the players saw the necessity of making restrictions to prevent inordinately large runs, and the Champions' Game was instituted at a tournament in 1879. This introduced four triangular spaces at the different corners of the table, thus diminishing the extent of space for the rail play. These spaces were afterward increased. A short time previous the cushion-carrom game was inaugurated, but neither it nor the other ever became widely popular. Other restrictions were made later, forming what are known as the "space" and "continuous-line" games, but they never attracted prominent public notice. These changes brought about a division among the leading billiard champions. Daly and Sexton devoted themselves to the cushion-carrom game, thinking it would ultimately become the popular game, while Schaefer and Slosson applied themselves to the balk-line game, which was first established by a tournament held in March, 1883, and which may fairly be considered a sort of compromise and the natural outgrowth of the various restrictive games. At first the eight-inch line was used, but it was afterward increased by degrees to fourteen inches. Schaefer's and Slosson's close adherence to this style of billiards gradually gave them that superiority over their opponents which enabled them to successfully give the odds in the present tournament. The last important contest played in this city up to the present time was that between Schaefer and Vignaux, from January 26 to 31, 1886, in which the little American easily defeated the Frenchman in a game of 4000 points, played in a series of five nights.

But it is a noteworthy fact that notwithstanding the long interim since a champion tournament was last played in this city, due chiefly to the inequality of the leading players at any one game, the game of billiards itself has extended vastly, and is popular to-day to an extent never before approached in this country.

S. GOODFRIEND.

THE LENTEN LECTURES AT OLD TRINITY.

ON Monday, February 24th, a series of addresses was begun at Trinity Church, the Rev. Dr. Phillips Brooks, of Boston, having consented to deliver six Lenten lectures to the business men of New York. The time for the daily service was fixed at twelve o'clock, and the intention was that the exercises should be finished within the hour. The addresses were for men alone, not because of any special subject or treatment, but because it was feared that women, if permitted to attend at all, would so throng the church that men would be thereby excluded.

The announcement which preceded this service was of the briefest and most inconspicuous kind; a paragraph in the daily press and a placard exposed upon the fence which surrounds the Trinity church-yard being the only steps taken to secure attendance.

The first address was listened to by a body of business men who comfortably filled the church; but since that day, at the noon hour, the interior has been packed with a notable congregation of representative business men of New York. As early as 11.30 each day the seats were all taken, and after that hour the throng that pressed in filled the aisles, the great space at the rear, and even crowded into the chancel. For the first time in the history of Trinity Church the chancel has been thus occupied. In this congregation were many of the busiest and most influential men of affairs in New York. Bankers, brokers, lawyers, and merchants of wide repute were there, sitting or standing beside young men who are clerks or other employés in the offices in and near Wall Street.

Hundreds have been daily turned away because the capacity of the church was reached fifteen minutes before the hour set for the service to begin. Many women have applied for admission; some of them even imploring the ushers to relax their vigilance, and permit them to enter. They have been denied, and in these great congregations for six days not a woman's face has been visible.

The services have been of the simplest kind. Threading his way with some difficulty, because of the throng, from the vestry-room to the pulpit, Dr. Brooks, having mounted to the desk, announced a hymn, one of the familiar songs of the church. The singing by these men of affairs, who but a moment before were busy with the activities of life, has been one of the most impressive features of the occasion. After the song and the pronouncing of the Lord's Prayer, Dr. Brooks began his address. He speaks with marvellous rapidity, but his voice is so melodious and his utterance so distinct that this quick utterance enhances the force of his thought.

The entire series has been devoted to the presentation of a single theme, "The Freedom of the Christian Life," and on each day the theme has been presented from a different point of view. Speaking to an audience composed of representatives of all sects, and containing many men who are of no sect, Dr. Brooks's addresses have been characterized by broad catholicity of thought and the most liberal of Christian opinions. The success attending this series has far surpassed the anticipation of the Rev. Dr. Dix and his associates in the direction of Trinity Church affairs.

RIMINI AND FRANCESCA.

THE tourist rarely stops at Rimini, for his only rule of faith and practice—the guide-book—has little to say about it. He has heard of Rimini of course, but it is only as the former residence of Francesca da Rimini, and as she has been dead for a long time, he does not think it worth while to stop at Rimini, and ask if there is anything new in connection with the painful scandal associated with Francesca's name.

And yet Rimini is a delightful old town. It is even gay during the summer bathing season, and there are worse ways of spending a July night than that of sitting on the balcony of the bathing establishment, listening to the band and watching the moonlight on the Adriatic. There are scores of pretty girls from all parts of Italy passing the evening in the same way, their mothers discussing clothing, their fathers smoking and talking politics, and they themselves watching demurely out of the corners of their wonderful eyes for a discreet glance from some eligible young man.

The town itself is bounded on three sides by water, being planted on the sea-shore between two rivers—the Marecchia and the Ausa. It is surrounded with ancient walls six hundred years old, and its streets are narrow and, not to put too fine a point upon it, gloomy. I wish I could say that Rimini is a cheerful place outside of the bathing establishment, but it really is not. Nevertheless, to a man who is in search of quiet, and wants a town where he can live economically, breathe pure air, and content himself with the feeling that he has gone back at least two centuries, and is living, say, in 1690, Rimini is delightful. You cannot spend a week at the Rimini hotel, and at the end of that time believe in the nineteenth century. In fact that prosaic century has not yet reached Rimini. Even that curious person Mr. Hare, whose industrious scissors have compiled a whole series of Italian guide-books, must have lost at least ten years when he visited Rimini, for he says of the Hotel Tre Re that it is "most comfortable," and of the Hotel Agnello d'Oro that it is "very inferior." Now the latter hotel ceased to exist fully ten years before Mr. Hare found it "very inferior."

Rimini has seen a great deal of history. It was originally an Umbrian city, with intervals of Etruscan conquest. Then the Senones—a tribe of Gauls—held it for many years. Afterward it was Roman, Byzantine, and Papal. Once it set up as an independent republic, and as such was ruled by the Malatesta family. Once it belonged to France, and at last it is Italian. Of all of these adventures in government, Rimini shows but few architectural traces, except such as are Roman or Malatestan. It has the remains of a Roman amphitheatre, but they are even more out of repair than is the average Roman remain. It has, however, a fine bridge over the Marecchia, which was built by Augustus, and is in use to this day. One of the arches was recently destroyed to arrest the march of Narses; that is to say, it was destroyed in the year 552, a date which seems quite recent in Rimini. The Goths were temporarily holding the town at the time, and Narses was bent on recapturing it for Byzantium. However, the bridge was afterward repaired, and is now as good as ever.

There is also a triumphal arch erected to Augustus during his days of prosperity. It is in fairly good repair, and wears still a fantastic head-dress of machicolated brick work, which was put upon it some time in the Middle Ages, when the only idea which a monument of any kind suggested to an Italian was how to fortify it, and shoot other people who might approach it. There is a famous stone—a fragment of a column—standing in the Piazza Giulio Cesare upon which Julius Cæsar stood and addressed his troops after he had crossed the Rubicon. If you have any doubts as to the truth of this legend, it is as well not to mention them openly in Rimini. It is one of the proudest possessions of Rimini, and her people do not like to have doubts cast upon it. If you wish to know my own opinion, I will frankly say that I do not believe that Cæsar ever stood on that stone, for it is much more probable that he stood on the steps of the neighboring church of St. Francisco di Paola, which would have afforded him a much better rostrum.

The Malatestas, or Bad-heads, as the name literally and appropriately means, ruled over Rimini for several centuries. Most of the buildings that are noteworthy in Rimini were built by or in the time of the Bad-heads. The Rock of the Malatestas, an immensely strong fortress, where the head of the family usually kept himself out of reach of his subjects, was dismantled in 1826 by the then pope, and Mr. Hare in mentioning it evidently suffers grinding torments because of the hopelessness of attributing the act to the "vandalism" of the Italian government—I should say the "Sardinian" government, for, as Mr. Hare's readers know, he has never recognized united Italy, and at the very thought of it he tears off his bonnet, throws it on the ground, and dances on it, using at the same time as much strong language as is consistent with his standing as an evangelical parson. Even in its present state the Rock is a wicked-looking old place. At one end of the Piazza Giulio Cesare stands the Cisterni Palace, in which Riminese tradition says that Francesca was killed, though it is more probable that she met her death within the walls of the Rock. The Palazzo Communale, although the Gothic part of it is older than the Malatesta period, is intimately associated with those able scoundrels, who used it then, as it is used now, as the City Hall of Rimini. It contains, by-the-bye, among other pictures, a Ghirlandajo and a Giovanni Bellini, which are gems in their way.

It is perhaps due to the dread inspired by these Malatestas that Rimini has felt the need of so strong a force of patron saints. While an ordinary Italian town is satisfied with one saintly protector, Rimini has no less than eight. This is all very well, provided the eight saints will work in concert; but if they disagree, or if each one assumes that some one of his colleagues will attend to the affairs of Rimini, and thereupon devotes himself exclusively to harp-playing, the town will find eight saints less efficient than one. Among these eight, St. Anthony of Padua stands very high in the estimation of the people. He once visited Rimini, and tried to preach to the people, but they refused to hear him, whereupon he walked down to the beach, and delivered a most eloquent sermon to the fishes, who listened with devout attention. If any one doubts this, let him go to Rimini, and he can see the very identical sea-beach. But Rimini has since repented of its rudeness, and has elected St. Anthony as a patron saint, which, let us hope, has smoothed over the original difference between the saint and the people.

The cathedral is a curious jumble of heathen temple and Christian cemetery, with very little of a church about it; but it is very interesting to the lover of mediæval tombs. It was transformed from a decent Gothic church into its present indescribable condition in 1450, by order of Sigismond Malatesta, who has, so to speak, a front tomb in the best part of the house. In the same church is a statue of Signora Isotta di Atti, representing her as St. Michael—with much wealth of leg—crushing the dragon. This statue greatly pains Mr. Hare, who says that it bears the impious inscription, "*Divæ Isottæ*"—To the divine Isotta.

Now Isotta was one of the celebrities of Rimini. Sigismond Malatesta had had a great deal of trouble with his wives. In fact he was obliged to kill no less than three of them, owing to the lack of facilities for divorce. Nevertheless he lived in peace and happiness with Isotta as his mistress. She was beautiful, well educated, and humane, and she saved the lives of scores of people whom Sigismond would have killed if she had not requested him to spare them. This woman, who could partially tame such an unspeakable tiger as Sigismond Malatesta, was, on the whole, the most respectable person known in the history of Rimini under the Malatestas, and if any one in that unhappy town deserved a statue it was Isotta. The inscription, instead of running as Mr. Hare says it runs, is as follows: "D. Isottæ Ariminensi B. M.," which being translated means, "To Lady Isotta of Rimini, of good memory"; "D." standing for *Dominæ*, and not for *Divæ*. The inscription has the merit of being truthful, and Mr. Hare's hysterics are, as usual, unnecessary. The tomb of Isotta is close to her statue, and here and elsewhere in the church are curious bass-reliefs, the work of Simone di Firenze, some of which, especially those of cherubs and children, are not unworthy of Luca della Robbia.

Every Italian town has or has had its own antiquarian. He is usually a priest, and he is always wonderfully painstaking and prolix in the extensive volumes which he writes concerning the antiquities of his native town. Rimini's antiquarian is a certain Doctor Luigi Tonini, and he has made a study of the story of Francesca which is a miracle of misapplied industry, but which nevertheless throws considerable new light on the tragedy which has furnished so much capital to poets of all grades and nations, from Dante to Leigh Hunt and Silvio Pellico.

Guido da Polenta, Lord of Ravenna, having fought the Malatesta, and had reason to repent of it, proposed to make peace, and as an inducement offered his daughter in marriage to Giovanni Malatesta. Parenthetically it might be remarked that Polenta means hasty-pudding; but it does not appear that the newspapers of the period made any airy jokes concerning the marriage of John Bad-head to Frances Hasty-pudding. Journalism was clearly in its infancy in the thirteenth century, which was the century in which the Malatestas and the Polentas intermarried. Giovanni Malatesta was not only a hunchback, but he was also lame, and was known to his contemporaries as Giovanni Zoppo, or Lame John. Neither did he possess any more of the beauty of holiness than did the rest of his family. Knowing his deficiencies, he did not care to shock Francesca by prematurely presenting himself to her, and he therefore hit upon the plan of sending his brother Paolo to Ravenna to marry her by proxy.

Here was where Giovanni's judgment was wrong. Paolo was a widower of more than forty years of age, and encumbered with two children; but he was rather handsome, and being a Malatesta, he was naturally anxious to do all the mischief that lay in his power. When Francesca met him she supposed that he was Giovanni, and at once fell in love with him. At least so she always said, if we are to believe Boccaccio, but as she obviously fibbed when she made her celebrated statement to Dante, we cannot implicitly believe her. She was married by proxy, according to Giovanni's plan, and Paolo conducted her to Rimini, where she met her real husband, and it is to be hoped he was satisfied with the successful way in which he had muddled the whole business.

What was Francesca's age, either at the time of her marriage or of her death, we have no means of knowing. She must, however, have lived for some years as the wife of Giovanni, for she became the mother of two children—a boy, whose name has not been preserved, and a girl named Concordia. She was evidently entitled to be regarded as a matron, and when she pictured herself to Dante as an innocent young girl, who was too impressionable to read poetry safely, she did not adhere strictly to truth. She had evidently carried on her intrigue with the middle-aged widower Paolo from the time when he escorted her from Ravenna to Rimini, and she was certainly old enough to know better. Her punishment, according to Dante, consisted in sailing serenely through the murky air of hell in perpetual company with Paolo. A pair of young lovers would hardly have regarded this as punishment, but two middle-aged persons, who had already carried on an intrigue for several years in gloomy Rimini, could hardly have had a worse punishment than that of being condemned forever to the exclusive society of one another.

Giovanni Malatesta, having learned of his wife's infidelity and his brother's treason, could not, as a mediæval gentleman, do less than to kill them both. This he did in about the year 1289, though it is fair to say that the date is not satisfactory to Dr. Tonini, who is prepared to write several octavo volumes

means of transportation within their reach. It is to be regretted that such a broad view of international intercourse does not obtain in the West and elsewhere in respect to other commercial operations. The American roads, or those who have invested in them, are not asking for protection in this matter, but solely for justice. It has not been suggested by any one that the American roads should have advantages legislated to them in their competition with the heavily subsidized and military railways of Canada; but every one whose sense of justice is not blunted, or whose mental vision is not obstructed by self-interest, must see that the Canadian roads enjoy advantages that the American roads do not, and that through no fault of theirs, but because Congress permits it. The conditions of the unequal struggle between the American and Canadian Trunk lines could be modified in favor of the first-named by administrative action. With the license now given them, the Canadian lines are able to do what is absolutely forbidden to a foreign vessel, namely, to engage in our coastwise trade.

It has been contended by those familiar with the subject that the Canadian railways could be compelled to accept the essential provisions of the Inter State Commerce Law, at least those provisions that have modified the natural conditions governing competition, by making their obedience to them the price of customs facilities in transporting freight out of the United States and into them again. Up to the present time, however, it has been impossible to make any progress in that direction. Such a movement to be successful would require co-operation between the Inter-State Commerce Commission and the Treasury Department, a coalition that is not likely to be made. It appears, therefore, that the only way in which the situation can be effectively dealt with is by an amendment to the Inter-State Commerce Law, specifying distinctly the terms upon which the Canadian companies shall share the traffic that American capital and labor are entirely adequate to handle.

The railroads now have what seems to be a most excellent opportunity to demand this relief, for a large and influential class of patrons of the railroads has already begun to demand the modification in their favor of one of the most important provisions of the law—that known as the long and short haul clause. The farmers, particularly at the West, are beginning to discover that the transportation industry cannot be run entirely as a wholesale business or as a retail business any more than any other industry or trade; that it must include both; and consequently they are beginning to clamor for the re-establishment of the old principle that is grounded in nature, and has been approved by common-sense and stood the test of time.

If these changes are made, and made speedily, there may be some chance for the champions of the Inter-State Law, and for the Commission established under it, to escape the attacks that are clearly gathering to reach for its most vulnerable point. Excellent information is that the Inter-State Commerce Commission is well convinced of the unconstitutionality of the law under which it is acting, and it is for this reason that it evades rendering decisions in important cases, where one party is quite as likely as the other, if dissatisfied with the ruling of the Commission, to raise and test the question of the constitutionality of the law. For some months the Commission has been drifting, and, for various trivial causes assigned, has performed no service of real importance to the railroads or their patrons. They have held under advisement for a year, lacking two weeks, the most important case that has ever been submitted to them, and one which was presented in the most exhaustive and able manner by both sides, namely, that of Coxe Brothers against the Lehigh Valley Railroad. The issue raised in that case is of the first importance to every individual miner of anthracite coal, to every coal-carrying railroad, and indeed to every one engaged in the coal industry, and more important than all, to every consumer of coal. Yet down to the present time no intimation of a decision has been given, and it is commonly reported in Washington that the Commission hopes that interest in the matter will die out, or the contestants come to a conclusion between themselves, and thus render a decision unnecessary. Possibly the reason for this seeming apathy is that this is one of the cases in which the railroad would be very likely to ignore an adverse decision, while the complainants can confidently be counted upon to carry the matter into and through the courts to that of last resort, should they be the defeated party. The Inter-State Commerce Law contains many beneficial provisions, but it should be enforced as a whole or repealed, and not permitted to become a dead letter upon the statute-books.

Collis Armstrong.

HENCE THESE TEARS (?)

SHAKEN OUT OF GEAR,

By malarial disease, the human machinery cannot half perform its office. Digestion, secretion, evacuation are disordered, the blood becomes watery, the nerves feeble, the countenance ghastly, sleep disturbed, and appetite capricious. Terrible is this disease, full its consequences. There is, however, a known antidote to the miasmatic poison, and a certain safeguard against it. In malarious regions of our South and West, in South America, Guatemala, and on the Isthmus of Panama, as well as in transmarine countries where the scourge exists, this inimitable preventive and remedy, Hostetter's Stomach Bitters, has, during the last thirty-five years, been constantly widening the area of its usefulness, and demonstrating its sovereign value. Liver complaint, dyspepsia, constipation, kidney trouble, rheumatism, and debility are all remedied by it.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

AN EXTENDED POPULARITY.

Brown's Bronchial Troches have been before the public many years. For relieving Coughs, Colds, and Throat Diseases they have been proved reliable. Sold only in boxes. Price, 25 cents.—[*Adv.*]

IMPERIAL GRANUM

is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Nicholson's Liquid Bread is an absolutely pure extract of malt, and is in general use. A pleasant beverage and healthful tonic. Beneficial in sickness or health. Grocers and druggists keep it.—[*Adv.*]

Blair's Pills.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[*Adv.*]

Mothers give Angostura Bitters to their children to stop colic and looseness of the bowels.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits, 25c. a box.—[*Adv.*]

Bad blood causes dyspepsia, and dyspepsia reacts by causing bad blood. So both go on, growing worse, until the whole system is poisoned. The surest means of relief for the victim is a thorough and persistent course of Ayer's Sarsaparilla.—[*Adv.*]

HARPER & BROTHERS, New York.

UP AND DOWN THE GREAT KANAWHA.

WEST VIRGINIA AND ITS CAPITAL.

BY ERNEST INGERSOLL.

I HAD diligently sought in eastern, or "Old," Virginia, as the people here call it, information in regard to West Virginia, but nobody seemed to know much about the latter State away from two or three lines of railway. I was therefore much struck when I came to examine here at Charleston a large map of West Virginia by the number of details it contained. Every little creek branch, each isolated spur and peak, had its name as well as the long watercourses and dividing ranges; and roads were marked, villages and post offices exhibited, throughout the whole extent of the mountains, even where there was not a railroad within 150 miles.

"The mountains seem to be well explored and known to their remotest corners," I remarked.

"Oh yes; we know the State, but outsiders do not, because they have not been taught its consequence. We have lain between the great avenues of Western emigration north of us, and of Southern travel to the east and south, and so the world has gone around us. But that is being remedied very rapidly. Two trunk lines of railway now cross east and west, and one of these (the Chesapeake and Ohio) is the shortest route to the sea from Chicago. Several branch lines are penetrating into the heart of the State to reach her timber tracts, and her rich but remote grazing and farming districts; while coal lands which far exceed in extent those possessed by any other State in the Union are now undergoing development upon a grand scale, not only in the older districts about Wheeling and Parkersburg, but in the upper Kanawha and New River valleys, along Coal River, and over on the Bluestone. Capital is coming from Northern and Western purses, yet so quietly that few of our own people comprehend the magnitude of the investments."

That a good beginning has been made is apparent in this pleasant and thriving capital, which has a brisk air quite in contrast to the ordinary Southern town. Its situation is good, both commercially and æsthetically. Noble hills rise all around it, except to the east, wooded for the most part, but here and there showing clearings covered with verdant turf or cultivated crops, and dotted with handsome suburban residences, while the city itself is built upon a plateau overlooking on the south the Great Kanawha, and on the west Elk River, which joins the former at this point.

Charleston now numbers about 10,000 people, but is much more of a city commercially than that population elsewhere would indicate. This is due to her isolation. There is no supplying point or larger town nearer than Cincinnati, 200 miles west; and twenty counties, or nearly half the State, together with a share of Kentucky, Tennessee, and Ohio, are directly tributary to Charleston's wholesale and jobbing houses, machine-shops, iron-works, and mills, while her civilization attracts to her as a residence many owners and managers of rich agricultural or mineral properties among the mountains, who are averse to living amid the rough and unpleasant scenes surrounding their mines and furnaces. Lastly, she is the capital of the State and the seat of the higher courts, and thus is the home not only of the officers of the commonwealth, but of leaders at the bar and aspiring politicians. A society which has furnished the State at one time a Governor, a United States Senator, and a Representative in Congress, is surely of some consequence.

It is largely a town of old families; men who descended from the pioneer settlers, and have inherited a large share of their peculiar virtues—prominently the strong bent toward personal liberty and the love of land. Naturally, however, such people are conservative; and it must be confessed that the valley is far less indebted to them for progress than to new-comers. This is equally true of the whole length of the mountain foot. The "old residenters" cannot appreciate the opportunities for expansion of business right under their feet, and must be pried out of the way before much can be done. A very small percentage of invested capital in mining, lumbering, furnaces, etc., here, or in Kentucky, Tennessee, or Alabama, is home money. For one reason, the people haven't had much to invest; but even if they had had it, they would not have done so, and consequently are losing their influence. This appears even in politics. This part of the State has been called the Gibraltar of Democracy, but now that faith has been so weakened that the Republicans expect to carry the next election. As the wheel of progress rolls on, those who were on top must necessarily be carried under, unless they can scramble up as the revolution proceeds. These Southern mountaineers are too stiff in their mental joints (with exceptions, of course), and perhaps constitutionally so. Let us see what their stock is.

Down this Great Kanawha River came the very first explorers of the mysterious "West" beyond the Alleghanies—sturdy Scotch-Irish Presbyterian people from Virginia and Pennsylvania, whose story is the most thrilling chapter in the whole exciting tale of American border adventure. As early as 1654 white men had found the head of the river in the upper part of the New, and had traced its course a little way; but it was not until 1748 that any settlement was made on these head waters, and not until 1755 that a party of captive women, hurried by raiding Shawnees back to their towns, near where Cincinnati now stands, learned in weariness and pain how the New, or Wood's River, descended through deep and rocky gorges, until expanded and re-enforced, it flowed northwestward, a strong and steady river, to the Ohio. This long watercourse, which drains a basin far larger than that of the Hudson, had names in all the Indian dialects of the West and South, for every tribe, from the Cherokees of Georgia to the Delawares and Six Nations of the North, knew the trails that led by it over the mountains; but after a while it was called among the whites after the Conoah-ways (as Daniel Boone spelled it)—an Algonkin tribe that occupied the region about its sources, and northward to the Potomac. Through many vicissitudes of spelling this name has been reduced to "Kanáwha," in which the *h* is misplaced and a terminal *y* is missing, for the phonetic orthography would be *Knaúway*.

It is a curious thing that the very earliest experiences and observations of the white people in this valley should have indicated what, until recently, was the principal industry here, and also what promises in the future to become a most important element in prosperity—salt and natural gas. As you drive up the Piedmont Road, which runs along the high river bank, as soon as you have passed Campbell's Creek, you come upon a tall and ruined chimney-stack and a large series of low roofs covering scores of rude wooden vats, all cracked and rotting together into a sort of picturesqueness most inviting to an etcher. These are abandoned salt-works on the site of the old Buffalo Lick, where fifty years ago 100,000 bushels of salt were made and sold annually. Some miles above is a quaint old village, apple-shaded and rose-embowered, once more important than Charleston itself, which was supported by other works, whose wells were bored near the famous Burning Spring, and the sites of which are marked by the crumbling memorial shafts of their tall chimneys. One establishment only persists, eight miles above town, and its methods are little varied from those of a primitive day.

When, in 1755, poor Mrs. William Ingles (who was the great-grandmother of Dr. J. P. Hale, of Charleston, author of *Trans-Alleghany Pioneers*) was carried down this way by the Shawnees, they stopped at Campbell's Creek, and spent several days in making salt. The buffalo, elk, and deer had worn a broad trail through the hills down to some saline springs on the river-bank; and while the warriors hunted and feasted, the white women were set at boiling brine in their own pans and kettles, which formed a part of the plunder; so that a supply of salt might be carried home by the Indians. The last buffalo killed in the Kanawha Valley was no longer ago than 1815, and within twelve miles of Charleston; the last elk, in 1820.

Mrs. Ingles escaped after a few months, and with almost incredible peril and endurance retraced her long route, and reached her friends in what is now Giles County, Virginia. Explorers and hunters, guided by her story, now and then went down the river, and after 1771 daring men and women were building cabins, and holding them as long as possible against the thousands of savages who swarmed in the woods; for what reason no one but their own foolhardy spirits could judge. One hears their praise sung as "heroes." Of the stuff of heroes they were made undoubtedly, but to go with families a hundred miles and more into this hostile wilderness ahead of the last man served no purpose, public or private, save the gratification of their own barbarous love of danger, and hence it was not heroism, but simply bravado; yet, being there, they acted always like true heroes in each other's defence, and it would be difficult to match some of the deeds of unselfish daring which these men and women were capable of during the Indian wars that constantly harassed the border. The best and most famous representative of them was Daniel Boone, who not only often passed up and down the Kanawha, but for eleven years, from 1788 to 1799, lived in a cabin on the south bank of the river opposite the salt lick. In 1791 he was lieutenant colonel of the local militia, and represented the new county in the Legislature at Richmond. Many traditions and relics of him remain here, such as manuscript notes of surveys, the trap which caught the first beaver west of the Alleghanies, and a walking stick of "yew pine," by which he introduced to the settlers this new tree, valuable forests of which he found covering the mountains of Pocahontas and Webster counties.

In 1773 a Colonel Bullit "took up" a thousand acres, embracing the present site of Charleston, as a reward for his military services; and two years later George Washington wandered about here, surveying for Colonel Fry, and looking up land for himself. A small pool had just been discovered about nine miles above the mouth of the Elk, which bubbled with exuding gas that would ignite and burn steadily. This spring, with 250 acres of the bottom land around it, Washington pre-empted. Now a well near by, 2500 feet deep, supplies gas enough to light the locks and dam of the Kanawha, and is soon to be utilized as fuel for a large furnace. This spring was an object of great interest to Washington, who by testament and deed left the acre of land upon which it stands as a free gift to the public, expressing his foresight that the time would come when it would be not only a curious but a most serviceable possession—just *how*, he was too unskilled to perceive; but by some defect of record the ownership soon reverted to private hands, and has remained so.

The pressure of emigration all along the mountainous frontier, from Boone's explorers in Kentucky to Cresap's "improvers' cabins," far up the Ohio, and the machinations of English loyalists, who hoped by an Indian war to so divert the attention and energies of the colonists that they would forget the grievances urging them to rebellion, resulted in the uprising under the leadership of Cornstalk, against which Virginia sent General Andrew Lewis and an army in 1774. These rough but ready troops rendezvoused at Camp Union (now Lewisburg, near White Sulphur Springs), and thence, 1200 strong, marched down the Greenbrier and Kanawha to the mouth of the latter river, where the battle of Point Pleasant was waged. It was the biggest Indian fight that had ever taken place up to that time, and a large number of its men afterward became very famous, or were the parents of famous men. But it was far more than that; for by its crushing defeat of the Indians it upset Lord Dunmore's treachery, caused the expulsion of that enemy of the colonies, and made the Revolutionary struggle possible. It was really the initial conflict of the war for independence, and one of the decisive battles of the world.

Feeling safe from the Indians after that, settlers began to multiply along the fertile bottom lands that bordered the Kanawha and its tributaries. A fort was sustained at Point Pleasant, but the settlers each had individual or neighborhood forts, and made their cabins as near bullet-proof as possible. The Salt Lick had been taken up, but this land at the junction of Kanawha and Elk rivers remained untouched until George Clendennin bought the land and went there to make his home, taking with him a party of former comrades in the Point Pleasant army, one of whom was a Ben Harrison, an indirect ancestor of the old General and of the present President of the United States. This was in 1788, and Clendennin's first move was to get the public surveyor of Greenbrier County, of which this was then a part, to lay off a town site, which he named Charlestown, in honor of his aged father, whose unmarked grave is now in the middle of a busy street. Clendennin's two-story house still stands, and is occupied, but its sound logs are concealed under weather-boarding and modern trimmings. The old stockade called Fort Lee, whence "Mad Ann" Bailey made her ride to Lewisburg during an Indian attack, and got the powder which saved the settlement, long ago disappeared.

From this beginning rose the town by slow degrees, but its progress would never have been so rapid had it not been for the neighboring salt lick. This had never been forgotten. All the pioneers resorted to it for their salt, which was boiled down in the one family kettle in which they cooked their hominy and pork, bear bacon, or other fare; in which on wash-days they scalded their clothes, and in spring made their maple sugar. Among the most prominent names now in the town and lower valley are Dickinson and Ruffner. They are leaders in mercantile matters and other enterprises. The only salt-works now in existence is managed by a Dickinson. It was the original Dickinson who sold the Lick land to the first Ruffner, who intended himself to go at salt making as a business. Circumstances prevented, and in 1797 his lessee, Elisha Brooks, setting up twenty-four small kettles in a double row over a fire, established himself as the first of the race of Kanawha salt-makers. His brine he dipped up from wells made by sinking two or three hollow logs endwise in the saline mud and quicksands, and thus managed to crystallize about one hundred and fifty pounds a day, which he could sell for eight or ten cents a pound. The brine was impregnated with iron, which gave the salt a reddish tinge, and it was to this fact that the country people attributed its peculiar strength and pungency. Orders came from far and near for "that strong red salt," which was delivered by trains of pack-horses.

Soon after Brooks, Ruffner's Sons went at manufacturing salt much more extensively. They attempted by sinking a "gum," or large hollow log, to get to the bottom of the saline ooze, but though they struck bed rock at thirteen feet, and cleaned out the bore of the gum, the brine that rose was weak and muddy. With slow toil and constantly recurring disappointment in their experiments, they at last succeeded in boring forty or more feet beneath the bottom of the gum. It was this first boring of a deep well on the western slope of the Alleghanies, where now thousands of such borings easily pierce the earth for hundreds and even thousands of feet, that called forth the simple contrivance called here "slips," and in Pennsylvania "jars," without which deep borings would probably never have been possible. The inventor was a sharp-witted mechanic named Billy Morris, who perceived that by giving his drill a chisel edge, backing it up by a heavy sinker, and attaching it to his line of driving poles by a pair of steel links, which played up and down within each other for some thirty inches, he could get a jarring or hammering stroke far more effective than when the chisel was stiffly attached to the long rod. This apparatus was also of great service in disengaging the tools when they stuck. Morris did not patent it, nor receive any special reward; yet when we consider the vast interests—petroleum, gas, artesian water, salt, etc.—it has served, this invention deserves to rank with the spinning-jenny, the electric key, or the sewing machine, and Charleston is proud of the man. The seed bag, an almost equally useful affair in well-boring, was also first thought of and applied in this same attempt to get at the subterranean source of the salt water.

When, fifty-eight feet below the surface, the strong brine was at last tapped, a new difficulty presented itself in the necessity of keeping out the muddy surface water.

"They had to invent, contrive, and construct anew. A metal tube would naturally suggest itself to them, but there were neither metal tubes, nor sheet metal, nor metal workers—save a home-made blacksmith—in all this region, and to bore a wooden tube forty feet long, and small enough in external diameter to go into the two-and-a-half-inch hole, was impracticable. What they did do was to whittle out of two long strips of wood two long half-tubes of the proper size, and fitting the edges carefully together, wrap the whole from end to end with small twine. This, with a bag of wrapping [the seed bag] near the lower end, to fit, as nearly as practicable, water-tight in the two-and-a-half-inch hole, was cautiously pressed down to its place, and found to answer the purpose perfectly. The brine flowed up freely through the tube into the gum, which was now provided with a water-tight floor or bottom, to hold it, and from which it was raised by the simple swape and bucket."

A new furnace was now built, and the price of salt fell to four cents a pound. Then other men went into it successfully, and an industry was developed which attracted a great increase of local population, for Kanawha salt was in demand in all parts of the country, especially for preserving meat—"salt-horse" and "sow-belly." By 1835 forty furnaces were evaporating two millions of bushels annually.

This product was at first sent down the river to Cincinnati and elsewhere in barrels piled upon enormous flat-boats, which were poled by hand, and the reminiscences of that period are full of amusing stories of the wild good-nature of the jolly boatmen. But after 1820 steam-boats began to come up this river, as well as along the Ohio, and the flat-boats disappeared, to the great detriment of the boat-yards. You may still see them, however, on both rivers, often covered with a house, and occupied by a migratory family of river folk. Sometimes they are gayly painted, have neat railings about the little deck at the ends to keep the children from tumbling off, and an air of coziness which makes the outsider envy their occupant his floating home. He is a tramp worth copying, for, snail-like, he carries his house with him wherever he goes, and owns at once both a carriage and a hotel.

For more than half a century the Kanawha Valley continued to be the largest salt-producing region in the United States except New York. When the Michigan fields began to compete, however, their stronger brine, cheaper fuel (sawdust), and proximity to the leading markets, forced the Virginia furnaces to close one after another, to the corresponding ruin of coopering and other attendant industries, until now one small one alone survives. Bromine and certain other chemicals are made from the bitterns at the same place.

I have dwelt upon this salt-making not only because it is interwoven with the history and is to a great extent the father of Charleston and of the prosperity of the valley, but because in its pursuit began the first use of coal and natural gas as furnace fuels.

The incident of Washington's "burning spring" will be remembered. Travellers at

with a desire to know whether the gas would burn, and going quite near, lighted a match. In an instant the whole atmosphere was aflame, and the engine house on fire. The professor by jumping into the river escaped with the loss of his hair and a good many burns; but only saved himself from going to jail and other consequential punishments by confessing to Colonel Dickinson's lawyer, that he was "a natural damned fool and didn't know any better."

The great success which has followed the search for gas in the neighborhood of Pittsburgh and Wheeling, and the fact that geologically this locality is suitably situated to expect similar developments, being upon the line of Rogers's "great anticlinal," along which the northerly gas wells have been struck, lead to the supposition that deep boring will find it here. A company of Pittsburgh and Charleston capitalists are testing the validity of this theory, and have put down three wells, from one of which there has already been gained at a depth of 2540 feet, a strong and persistent flow. This is utilized at present only to illuminate the river at the locks nine miles above Charleston, but a portion of it is to be led to the salt furnace. New wells are shortly to be driven, and if successful, the gas will be piped to the city. There seems to me no reason to doubt that somebody will find the reservoir again, and when it is tapped that all the great prosperity dreamed of will come to the locality in consequence, for marvellous stores of iron and timber are close at hand, and a facility of transportation which leaves Wheeling and Pittsburgh quite in the shade, so far as the river routes are concerned, and which quite equals them in the ease and distance of railway carriage to the seaboard.

When that gas is found, no doubt petroleum will be struck also. The gas and brine that come up are both impregnated with oil, and the very first shipment of fifty barrels of petroleum (skimmed from the salt-water) ever made went from this town to a Cincinnati druggist to be bottled and sold as liniment under high-sounding names.

Just before the war something like a million dollars was spent at Cannelton, a few miles up the valley, in making oil from cannel-coal, but the discovery of petroleum in Pennsylvania in 1861 put an end to this.

Socially before the war Charleston, which then had some 1500 inhabitants, combined

their edges, en echelon. This pavement has now been down on the main street over twenty years, and appears to be as good as new. It is asserted by experts that few varieties of granite block will endure traffic so well; it is as smooth as asphalt, and very easily repaired, while its cost here is less than a dollar a square yard, while good granite costs four to six dollars.

This fine red brick is employed in the new Federal building and in the State Capitol, which is a handsome edifice occupying a pretty square in the heart of the city. The decoration and furnishing of this building are on a generous scale and in excellent taste, and the city is justly proud of the final acquisition of this "Capitol on wheels," as the irreverent used to term it. One of its rooms is devoted to the State Library, made up of a valuable collection of law books, with some general literature. Formerly the town possessed a public library, but now nothing of the kind exists, nor is there a museum nor historical society, though Charleston boasts several citizens well versed in the local lore, and the possessors of relics and archives of much historical interest which ought to be preserved in some public collection. This is an intelligent and well-schooled community; but the art society, the lecture course, and the Browning club have not yet taken root. Now that she has her water works completed, two daily newspapers, her streets lighted by electricity, and the big new high-school done, perhaps the rest will be attended to without delay.

Although the town had largely augmented its population, had just been connected with the seaboard by the completion of the Chesapeake and Ohio Railway, and the mineral resources were undergoing rapid development, the financial calamity of 1873 gave it and the Kanawha Valley a blow from which they have required years to recover. As the decline almost to extinction of her salt making and its attendant industries came soon after, Charleston would perhaps never—certainly not by this time—have regained her strength, had it not been for the improvement in the navigation of the river, the remarkable advance of coal mining in the valley, and increase of iron and lumber making.

If you will examine a map of West Virginia, you will see that the sources and feeders of the Kanawha drain one-third of a State hardly inferior in size to Pennsylvania. The

interstratified with the carboniferous sandstones inclined against the Alleghanies, lies bituminous coal in every variety. It is the mainstay of the country. West Virginia's coal area amounts to 16,000 square miles, while Pennsylvania, the next largest, has only 12,700. Out of 54 counties only the 6 in the extreme northwestern corner lack coal, yet hitherto West Virginia has mined less than ten per cent. of the total yield of the Appalachian field, which spreads north to central Pennsylvania and northern Ohio, and south to middle Alabama. This shows how much room there is for development here, where, as we shall see, circumstances are peculiarly favorable for building up an immense coal production and trade.

Though mining has been done here and there on its tributaries, the great body of capital—almost wholly from the North—is invested along the Kanawha and New rivers, within sixty miles above Charleston. These are the Upper Coal Measures, and three separate beds are worked. Those mines along the lower part of the river are dug into the stratum "No. XIV.," or "Pittsburgh"; the group near Kanawha Falls is on "No. XIII."; and those farther up the New River Cañon are in the lowest or "conglomerate" beds, numbered "XII."

Of course the earliest settlers knew of this coal, which crops out in half the cliffs and stream beds, and Rogers had outlined the whole field before 1840, yet no coal was burned here except by blacksmiths until 1817, when a workable seam was discovered near Charleston, and at the instance of Mr. William H. Edwards (of Coalburg, the same who is known so widely by his splendid illustrated work on American butterflies), the Ruffner Brothers experimented as to its use in the furnace at their works. Thirty salt factories were then running, and all the wood had been cut off the near hills to feed their fires.

The ability, soon acquired, to burn mineral coal gave a great impetus to salt-making not only, but led to the inauguration of the new mining industries, which now support 50,000 people in this valley alone.

Coal mines occur all along the river on both sides, from six miles to about sixty above the city, and up many of the gulches, where several short branch railways have been extended. The coal crops out above Charleston, and is dug at all altitudes in the hills where it is accessible by drifts or horizontal tunnels.

have at least begun to be realized had not the civil war intervened. When peace returned, the people renewed their clamor, the opinions of the French engineers were requoted, and President Grant sent a commission here, which recommended the deepening of the river by a series of seven dams with locks, forming what is termed a slack-water navigability in the Kanawha. This was acceded to by Congress, and the work placed in charge of Mr. Addison M. Scott, who began operations in 1875. Several of the uppermost of these structures are completed, and large tow-boats and steamers can now ascend to Kanawha Falls, the natural head of navigation. When the entire improvement planned has been accomplished, there will be a continuous channel depth of at least seven feet, and coal barges can be locked down as fast as they can be loaded, and at less expense than now, while the empty barges returning will not interfere with the traffic.

With two exceptions all these dams are of the French movable pattern, copied by our engineers from those on the Seine and Loire—another legacy of the by-gone scheme. This consists of a line of uprights hinged upon a strong foundation of masonry, which lie down flat on the bottom, out of the way of boats at high water, but when the water is low can be lifted one by one and fixed upright, until a close fence is formed across the river which effectually dams the water back to the required depth. This was the first American application of this contrivance, which has since been adopted in one or two other Western rivers.

The expenditure thus far has been about $2,000,000, but the increase of business effected, and the reduction in the price of coal ensuing upon cheapened carriage, has reimbursed the tax-payers many times over.

The coals of this region are superior in quality. Cannel is mined in two or more localities, and the "splint" or "block" variety—hard, shining, and carrying well—which is so useful for domestic service and for raw use in blast-furnaces, is plentiful. This and even the poorer grades exceed in quality those of the Pittsburgh district, and those of Ohio and Illinois, in their proportion of fixed carbon, and in having a less percentage of sulphur. Mr. William Seymour Edwards, who has made a study of this matter, and to whom I am indebted for much information, declares these coals to be

SOME NEW YORK CLUBS.

BY HENRY L. NELSON.

ILLUSTRATED BY T. DE THULSTRUP, CHARLES GRAHAM, AND BERT WILDER.

THERE is such a vast difference between the New York of the early part of the century and the New York of to-day, that we are not quite justified in saying that the one has developed from the other. The stream of growth has been diverted from its original course. The city, whose people once felt for it a local pride as intense as that which inspires the citizens of Boston or Philadelphia, is very largely the mere abiding-place of comparative strangers, who find it the best town of the country for making and spending money. New York, grown into a great metropolis, has suffered more than the usual fate of metropolitan cities. The native Londoner or Parisian is still fond of his birthplace, not alone of its history, but of its present achievements; the native New-Yorker—and he is rarely met—loves the memories of a cruder past. It is difficult for the stranger to find the old New-Yorker. He is crowded out of sight by the foreign immigrant, by the New-Englander—who at his first coming did not meet with a very generous welcome—by the Western millionaire, who is surcharging the social atmosphere with the ozone of extravagance. It used to be said by the late Miss Booth that all the native New-Yorkers had moved away, and that it was impossible to find one who continued to live in the city of his birth. One is less surprised to hear a resident of the town say that he was born in Massachusetts or Ohio or Ireland than that he first saw the light in New York. You will find Scotchmen, Yorkshiremen, Cornishmen, Hampshiremen, Frenchmen, Welshmen, and Irishmen in London, but there are cockneys too. Were there ever cockneys in New York? If you do not know that there were—and not many years ago at that—you do not know the metropolis.

But the "Bowery Boy," with his red shirt, black doeskin trousers rolled up or tucked into his boots, his tall hat, his soap-lock, his cigar raking upward, as the masts of the old pirate crafts raked backward—this patronizing acquaintance of Mr. Thackeray's was not the only cockney of his time. He was unique and interesting. He knew the Bowery and its haunts. He hated the Irishman and the Yankee. But he was not alone. Over in the Ninth Ward were the American mechanics and carmen, who were almost the first "Know Nothings" in the city, and who not only were unacquainted with anything better than that part of the town which had been Greenwich Village, but who believed that nothing could be better. There were a host of retail shopkeepers whose idea of rural scenes was limited by the Elysian Fields at Hoboken, which were once the New-Yorker's paradise, but are now devoted to Germans and beer. There were New-Yorkers who knew about horse trots, and were convinced that there was no track but the Union track, who loved cock-fighting and an occasional battle of dogs, but to whose thinking there were no sporting men or sporting places beyond Harlem. When a Bostonian or Philadelphian chanced to visit their haunts, they spoke of his coming as a wonder, and tolerantly gave him an opportunity to lose his money. There was bliss on the Fishing Banks and joy at Coney Island; but these resorts were attractive because one might spend a day at either of them and still sleep in New York. There were tap rooms, sometimes called porter-houses, at which persons known as "the wits" used to assemble, and there are chronicles in which the discussions and scintillations of men whose names are now unknown are compared to evenings with Shakespeare and Jonson at "The Mermaid." There was the "Pewter Mug," the famous neighbor of Tammany Hall, when Tammany was content with down-town quarters, where Democratic politicians made slates, where Aaron Burr always kept a private room, and at whose bar Andrew Jackson won the admiration of the local magnates by standing up to his toddy like any ordinary American citizen. The most sturdy Democrats are often they who most abjectly appreciate undisguised condescension. Long afterward there was "Old Tom's," or the "Crooked Stoop." There were a "Shakespeare Inn" and a "Greenroom," the haunts of men who fondly thought their town rich in the life that gives to antique London its musty literary and artistic flavor. Earlier than all these was the famous "Bank Coffee-house," kept by Niblo—the great "Billy" Niblo, who afterward built the garden and theatre away up town at Broadway and Prince Street. It was here that the city politicians, at a time when New York names were very common in the Board of Aldermen, feasted after a fashion that gave point to the common joke concerning "Aldermanic proportions," not that New York was the first to fatten its Aldermen to a prize figure, the Aldermen of the Guilds of London ate their turtle and waxed fat centuries before the English did the Dutch out of New Amsterdam. At the "Bank Coffee-house," however, there were paunch-creating feasts that would astonish the champagne magnates of to-day. There was one at which a bear was served roasted whole, and to accompany it were vast quantities of venison, 'possum, ducks, partridges, quail, beef, and pork. And to wash these down were scores of bottles of sound Madeira. Men did not feed so delicately in those old days as they do now; but there were famous cooks, oysters and game were plentiful, and there was great rivalry between New York, Philadelphia, and Baltimore in the matter of gastronomy. The bulging Aldermen of the three towns, whenever their civic amusements brought them together, disputed the night through over the comparative merits of their respective markets; and many are the battles that have been fought in defence of the oysters of the East River and Blue Point against the pretensions of the oysters of the Chesapeake and Lynn Haven bays.

Time mellows the memory of that period, and perhaps the fat-feeding Aldermen are more conspicuous in history than they were in their own day. They were the every-day public thoroughfare people—genial, good-natured, provincial. Their like does not now exist conspicuously, and it is hardly worth while discussing whether what has taken their place is or is not an improvement. Perhaps even those who are strenuous in asserting that all things have improved in the general advance of civilization will admit at least that when the ordinary street life of the town was American, it was perhaps as good as it is now when it is cosmopolitan. There was a great deal of local pride in New York in the early days, and there was a great deal of raw elegance. The sumptuous gluttony of the Aldermen, the unique and gusty charms of the Bowery Boy, were symptomatic. New York was the biggest place in this free and independent nation, and therefore the biggest place on earth. The plain people were content to live here, and rejoiced in what nature and man had done for them; while as to the great, was there not in the Duke of York's province, and in the more modern city, a society the like of which did not exist elsewhere in the New World? No one who lived in New York wanted to go anywhere else, except for a visit of curiosity. From the time when the Schout, Burgomasters, and Schepens ruled the town there was a splendor about the hospitality of New York that did not exist in any other part of the country. When Colonel Abraham De Peyster was Mayor, his house on Queen Street was the scene of entertainments not surpassed in pomp and magnificence even in these later days of superabundant wealth and extravagance. Outside the walls of the city, its gardens stretched to the East River, its immense rooms, some of them forty feet deep, were rich in carvings and gorgeous in furniture imported from London. From its iron balconies the Governors of the Province reviewed the civic and military processions. Mrs. Lamb tells us that the plate which Mayor De Peyster daily used on his table was valued at $8500. They were rare old times when the leading citizens were lords of manors, when gentlemen wore silks and velvets, when manners were softened by the knowledge that rudeness would be followed by the duel; but New York was not a great city in those days—not even half so great as the good people who lived here thought.

New York was rich and luxurious early in the century. John Adams was not the only rural wayfarer from Boston who wondered at the luxury of its entertainments, the costliness of its plate, the expensiveness of the dressing of both women and men, the elegance of the houses. New York was always fond of what the inventors of after-dinner pills call "the pleasures of the table," but which may be more fitly termed the delights of the stomach. The Aldermen were not the only inhabitants of the town who grew fat on good living. When Boston was dining at noon, and dissipating in simple suppers which could not possibly interfere with digestion, New York was revelling in late dinners, and was dainty about its cooking. A great cook was a great man, even down to the middle of the century. There are many men living to-day who recall the famous Henri Gussin, and the still more famous Kerner, in very early days the steward of the Union Club, and at whose annual dinner the best men of the city sat down. It was a mighty privilege to dine with Kerner on this occasion, and many a rich man has longed for the fiat of the great cook which pronounced the happy recipient a member of the best society. It was quite as great a privilege to be permitted to order shirts at Mrs. Cannon's, for that admirable and highly esteemed lady insisted that the man who wore linen from her shop should have social position; and the favored men frequented her charming parlors where the formation of the Union Club was discussed and decided upon. There is before me now a list of the men who met one another at Mrs. Cannon's, kindly written out for me by one of them—one of the few who attended the good lady's funeral. It is impossible to give all these names; but some of them are famous in politics, in society, in the literature of the time. There were John Jacob Astor, the Schuylers, Rays, Emmetts, Suydams, Lydigs, Heckschers, Hoyts, Grinnells, Binningers, Livingstons, Robinsons, Ogden Hoffman, the Le Roys, Fearings, John Van Buren. The names are redolent of old New York, of its gay, luxurious life when money was pouring into the coffers of its merchants from its foreign trade, and the city was becoming one of the great seaports of the world. In those days the greatest merchants were in the shipping business, the bankers were dealing in foreign exchange, so that there was an infusion of clever young foreigners—Germans, Swiss, French, and English—in the city. The foreigners belonged to the commercial classes of their own countries, some of them represented, and they and their sons continue to represent the leading banking and shipping houses of the Old

us of this generation. Literature was in the care of Irving, Paulding, and Bryant in the teens, twenties, and thirties, and New York did Irving honor, and so dignified itself. When he came back from Spain, his fellow-citizens feasted him; and when Dickens first visited the country, Irving was the chairman of the public dinner. The difference between the treatment that literary men receive in New York and Boston exists now as it existed then. Boston society accepts a literary man as an entertainer, comrade, and instructor; New York worships its idols. Irving was a strange being, a startling innovation; he was the son of an old New York merchant, and nevertheless possessed literary abilities.

The first clubs of New York were such as Dr. Johnson organized and loved, with a difference. The pleasure of the Johnson club was its talk; that of the New York club was its dinner. The old New Yorkers deceived themselves into believing that they were intellectual descendants of Shakespeare and Ben Jonson, of Sam Johnson, Garrick, Goldsmith, and Reynolds, because they met in taverns at stated and regular times, but every one who has read William Irving's poetry in *Salmagundi* knows better.

This, however, is not true of the first club of the city, the lawyers' Moot Club, at which cases were tried and questions of law argued. It was founded in 1775, and among its members were John Jay, Gouverneur Morris, and Stephen De Lancey. They lived in the day when the literature of their profession was making.

In 1792 the Drone Club was founded as a social and literary organization. Afterward came the Kraut Club, which met annually for a dinner; the Turtle Club; the Bread and Cheese Club, founded by James Fenimore Cooper in 1824. All of them were on the Johnsonian model. There was a dash of literary flavor in them, at a time when every scribbler for the somewhat thin and altogether subservient press was counted a man of letters. Very humble chroniclers of the doings of the times were those scribblers who, at public dinners, when their lords, the Aldermen, fed themselves, stood in the hallway, and noted the elegant company, and smelled the savory dishes as they were borne by them. When they got inside their back rooms on club nights, however, they were the true successors of the wits of the Queen Anne Coffee-house and the clubs of the great lexicographer.

Even the best was not surpassing fair. Social life was the art of the men who were spending the fast accumulating money that was sending New York very far to the front of all the cities of the continent. They were dancing and supping at the City Hall, Washington Hall, the City Hotel, and at one greater ballroom after another, until the Academy of Music crowned the pleasure-seeking efforts of the generations before the war. "In process of time," says Salmagundi, speaking of the Gothamites after the invasion of the Hoppingtots, "they had waxed to be most flagrant, outrageous, and abandoned dancers; they ponder on naught but how to gallantize it at balls, routs, and fandangoes, insomuch that the like was in no time or place ever observed before. They do, moreover, pitifully devote their nights to the jollification of the legs, and their days, forsooth, to the instruction and edification of the heel. And to conclude: their young folk, who whilom did bestow a modicum of leisure upon the head, have of late utterly abandoned this hopeful task, and have quietly, as it were, settled themselves down into mere machines, wound up by a tune, and set in motion by a fiddle-stick!"

The most famous of the dinner-giving organizations was the Hone Club, founded in 1836, and named for Mayor Philip Hone. Its members were among the first merchants of the city, and were all admirers of Daniel Webster. Philip Hone lived in a fine house directly opposite the City Hall Park, and afterward at the corner of Broadway and Great Jones Street. He was an admirable specimen of his class—rich, generous, and hospitable. When he was Mayor his entertainments to distinguished visitors were so lavish that his friends insisted on relieving him of part of his assumed burdens. Therefore the Hone Club was established. Dinners were given by the members in turn at their own houses, and it was understood that on the days when the great Daniel looked in upon the town, the member whose turn it was should give his dinner then. Those were happy days for Webster and for the merchant princes who feasted him, for he had the noble products of a great *chef* and the rich contents of a fine cellar, while the others enjoyed the stimulating presence of the lion of his day. Sometimes Irving was a guest of the Hone Club—modest Mr. Irving, who ran away from public dinners for fear that he might be called upon for a speech, and whose happiest after-dinner effort was his confession that he had forgotten the lines of his prepared address to Charles Dickens. But the sparkle of New York life in the first half of the century did not bubble up in literature and in literary conversation. Boston was much better off in that respect, as it is to-day. There were law, theology, and commerce; and, for pleasure, eating, drinking, dancing, and the theatre.

First of all clubs of the city, as clubs were known in London and are now known everywhere, was the Union. It and the Hone were established in the same year. Some of the twenty members of the latter were also members of the former. The Union Club sprang into being full fledged. It did not, like so many others of its time, develop from a room or two; first without a restaurant, then with a back-door connection with a neighboring restaurateur; at length, if successful, achieving the glories of its own *chef* and *cuisine*. It had a house of its own on Broadway, and its members were the social magnates of New York, the Astors, the Edgars, Schuylers, Suydams, Lydigs, Le Roys, Griswolds—it is unnecessary to name them all. The New-Yorker of the time knew them, and his veneration for their names was even greater than his worship of Irving's genius—the one was a pleasure, while the other was a duty.

The formal meeting for organization was held at the Athenæum. The membership was limited to 400. Philip Hone says, in his diary, that it was "to be similar in its plan and regulations to the great clubs of London, which give a tone and character to the society of the British metropolis." The first house was at 343 Broadway, and the first president was Samuel Jones.

English the club was, indeed, as English manners were known to these good merchants, who thus became the founders of our local aristocracy. Yet at this time Fanny Kemble was laughing at a dinner given by Philip Hone himself, and complaining of the absence of finger-bowls from his table. "The club will be well

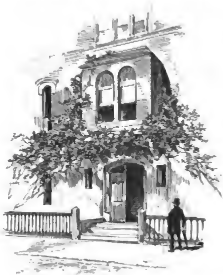
suited to the times," writes the ex-Mayor in the panic year 1837. "A single gentleman will be able to get a good dinner and his wine for half the price he would have to pay at a hotel."

It was not only the first club of the city, it was the first



THE ENTRANCE TO THE CALUMET.

real club in the country—the first club intended to be a home for bachelors, and to furnish the creature comforts found by clubless men in taverns. There was some need of it. Rich bachelors were increasing, for young foreigners were coming here to engage in business, and sons of native merchants wanted their fling before they finally settled down.

The club house was formally opened May 27, 1837, with a dinner for which the *chef* was much commended. The New York palate was then in a transition state. Its ambition was to be able to enjoy artistic French cookery, but it could not help a certain wholesome longing for the rich products of the vicinage, dressed and cooked after the fashion that had prevailed since old Dutch times. The Union has always been famous for its cooking, but three months after that excellent opening dinner there was a turtle dinner at the club, which was pronounced execrable, "for a French *artiste de cuisine* knows nothing about turtle."

There seems to have been a daily *table d'hôte*, at the head of which the president, Chancellor Jones, usually sat.

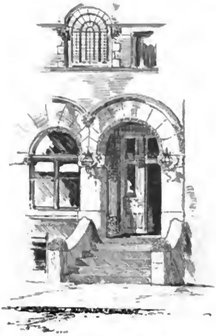
The second house of the club was at 376 Broadway, higher up, and on the opposite side of the street. It was a large and handsome dwelling that belonged to Mr. William B. Astor. It was May, 1842, when the club moved in, and there it remained until 1850, when it took Mr. Kernochan's house, on Broadway, opposite Great Jones Street.

Club men of our fathers' days talked on the same subjects that now interest their descendants. Mr. Hone says, "Horse-racing and politics are discussed by those who know little about either of those abstruse sciences." The young and old beaux lounged in the windows, and saw the gay panorama of the streets pass before them. Broadway was then, in its smaller way, what Fifth Avenue is to-day. The idle gentlemen of the town did as idle gentlemen have done always, and amused themselves and one another. The stronger men used the club for dinners and receptions to distinguished persons. The club was and has remained an expression of the prosperous life of New York. Its founders were the great merchants of the city and their sons, and its development and growth have been along the lines on which the city itself has advanced. There has been a revolt in its history against what appeared to be a change in its character; but it was not a change. It is true the old city names make less of a showing on the roll of members, but it is also true that the signs on the Broadway stores do not bear the names that were to be read there forty or even twenty years ago.

The scions of old families whose wealth came from the old ways of doing business are spending what is left of their inherited fortunes, or are trying to fit themselves to the new methods. The shipping merchant, the dealer in his own wares, and the banker, who put their money into substantial brick and stone houses, have been succeeded by the commission merchant and the broker, who invest their profits in railroad and telegraph securities. The business methods of this commercial town have shifted. New men have come in from the East and the West. There is a strong flavor of New England in our high places—a flavor which was already beginning to be perceptible when Mr. Knickerbocker wrote his veracious history. There is now a fresh and breezy impulse from the West which is chilling the old marrow of the natives, who remember the day when their fathers' stately ships went up and down the bordering rivers. But if the new order has brought new men, and if the channels of our trade have worn new ways, who shall shut the doors of clubs and society in the faces of the men who have wrought and who have thriven? Not the Union certainly, for it has hospitably taken whatever of good has come to it. The city is commercial. It has very little aristocracy that does not rest on trade. We are not a bookish people, although there are many bookish men and women among us, and it would be idle to pretend that we are. Fifty years ago there was a book club in New York which met at stated intervals for the consumption of unstinted punch and food. Its single volume was for the recording of dinner subscriptions. It was a genial reflection of the city. Its name denoted a polite respect for letters; its frank and fleshly purpose was the gratification of the stomach.

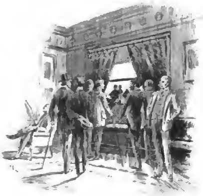
Do not let me be misunderstood. There is a strong and vigorous literary and artistic life in the city, and there has always been much erudition among our professional men. There are bookworms, bibliophiles, antiquarian book-stores, splendid and curious collections of literary treasures; but I am speaking now of the complexion of the good town as the world sees it, of the kind of life which is manifested in the daily ebb and flow of its human tide. We shall soon enough come to consider the strong under-currents and eddies.

When, in 1855, the Union Club went into its own great brown-stone palace on the corner of Fifth Avenue and Twenty-first Street, it was not the only club of its kind in the city. The New York Club was organized in 1845 by a newer element in the city than was to be found in the membership of



THE ENTRANCE TO THE GROLIER.

the Union. It reflected a brisker life. It was more in the centre of the active forces that gained their impetus in Wall Street. When the Union was following the northward trend of the city's homes, the New York Club established itself in Chambers Street opposite the present Court-house. It took the New York Club a long time to finally make up its mind to go uptown. It moved to the corner of Broadway and Walker Street; then to 737 Broadway, a few doors below the store now occupied by Charles Scribner's Sons; then it went back to 558 Broadway, below Prince Street; in 1851 it was at 620 Broadway, above Houston Street; in 1856 it occupied the Wolfe house, on the corner of Astor Place and Broadway; in 1862 it bought the large dwelling-house on



AT THE WINDOW OF THE CALUMET.

the corner of Fifteenth Street and Fifth Avenue, which is still known as the Haight house. In this elegant house, built by one of the most fastidious of the old city merchants, the club remained for eight years. It was as characteristic of New York as the Union, but very different. It was always and definitely the New York of the present. Memories and traditions did not haunt its halls or sit in its windows with their hats on. It has been always a club of the generation actively on the stage. Great lawyers and rich merchants have been among its members, but the roots of most of the club list interlaced, and had hold on some other soil than that of Manhattan Island.

In 1870 the club was suddenly and somewhat unaccountably dissolved, and it was destined not to be counted as one of the prominent clubs of the city for many years. It is true that it was at once reorganized, but it went wandering about from house to house. Now its rooms were in Union Square; now they were on Fifth Avenue. At one time it occupied

city's population as they do in Bos-

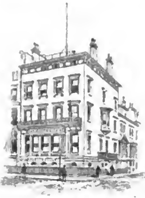
ton, where the literary worker is more likely to find congenial comradeship outside of his profession.

The Century was very humble in its early day. It had not yet taken into its membership the men of wealth who have at last succeeded in inducing it to abandon its pleasant quarters in Fifteenth Street to move into a splendid building, which will doubtless make the club a more important feature of the fashionable life of the town. In the very early years it was obliged to be content with rooms. For two years these were at 495 Broadway; in 1850 they were in Broome Street; then until 1852 at 575 Broadway; and then there came the crowning dignity of a house, which was situated in Clinton Street, then a delightful part of the city. For five years the Century enjoyed this house. The most dignified and prosperous of the guild of art and letters met in its rooms. Membership was then, as it has continued to be, a high privilege. In 1857 the club was incorporated, and its incorporators were the first citizens of the time. They were Gulian C. Verplanck, the most famous and popular New-Yorker of his generation; William Cullen Bryant, Charles M. Leupp, Asher B. Durand, John F. Kensett, William Kemble, and William H. Appleton.

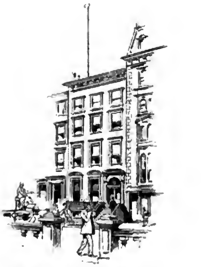
The club built a home for itself in the year of its incorporation in which it has dwelt ever since, and here have been held its Saturday evenings, known of all distinguished men who visit the metropolis. Will its evenings in the new palace on Forty-third Street be pleasanter? Some of the old men shake their heads at this, but then they always shake their heads when the car starts forward.

The Century, old, well-established, dignified, rich in character and tradition, is not the only club which has grown out of the social needs and desires of the men who write and illustrate books, paint pictures, or carve statues. There have been scores of other organizations, some of them based on economy, while others sought to maintain a more Bohemian atmosphere than can be found in a club whose members are constrained to consult the tastes and nerves of the most fastidious of their fellows. Bohemianism is not so fashionable as it once was, and what remains of it has grown to be more respectable. It has been discovered by undeveloped genius that a Sunday joint at home is better than seven days of beer and cheese in a cellar; that a man who respects and cares for his body is not only sounder in mind, but in heart; and that the cleanlier his life the more can he accomplish for that part of the world which needs his help. So the Bohemian clubs have not endured, and wherever Bohemianism in its offensive forms is an element in a club, therein the club is weak. The economical clubs have also wasted away after a brief existence, not that economy is less commendable in club life than in the household, but the organizations of which I am speaking were usually formed by men who could ill afford the most trifling of luxuries, and were doomed to failure from their inception. It would be almost impossible to name them, so brief and evanescent were their lives.

Of all the clubs which had their origin in the intellectual and cultured life of the city, with the exception of the Century, the Lotos has been the most ambitious. In many respects it has also been the most popular club in New York, for it has its ladies' days, and its semi-public exhibitions of pictures. It is a great entertainer of celebrities; but since its foundation in 1870 it has lost much of its distinctive character, the man about town rather obscuring the artist and literary man. Out of the Lotos Club grew the Arcadian, the result of discontent. The Arcadian is gone, having died of an overdose of guests. It made the fatal mistake of centring the interest of the members in its receptions. On other days and nights the rooms were empty; the members rarely met and scarcely knew one another; but there were great occasions when the rooms were filled with guests whom the members entertained. An excellent club in its time was the Palette, and the Tile Club has been most enjoyable, the members producing something at its meetings that justified the club's name, just as the Grolier Club accomplishes an object by reproducing the work of famous printers. Of all the art clubs of New York the Salmagundi has been the most prosperous, and now it has in contemplation a house of its own, where there will be a gallery for the exhibition of its pictures. If the club is wise it will be careful in extending its membership beyond the professionals. The patrons of art are worthy people and deserve encouragement. Let them subscribe liberally for a building that shall be the home of artists, and let them receive their compensation in the galleries, which should be ample for them if they are worthy of becoming subscribers at all; but the club hearth should be guarded as jealously as the domestic hearth; and while there are patrons of art who might bring with them a welcome addition of good-fellowship, there are many who would not. In dealing with this matter, a judicious board of governors is much better than a hard and fast rule.



THE KNICKERBOCKER



THE FRONT OF THE ST NICHOLAS.

This last observation is especially applicable to the Fellowcraft, almost, if not quite, the last addition to clubdom. Clubs have been springing up so abundantly of recent years that it would be impossible to say off-hand which is the youngest unless one took a daily census. The Fellowcraft, about two years old, is now the occupant of the house in Twenty-ninth Street once the abiding-place of the St. Nicholas, and afterward of the St. James's. Its membership is composed of writers and illustrators of periodicals. Mr. Richard Watson Gilder is the only president it has had. The club has many elements of successful, vigorous life, but it has been too exclusive; it has shut the door against men who would give to it both strength and character. It has met with a wonderful success, and it is destined to become one of the most distinguished of New York's clubs, especially when its basis of membership is broadened, as it soon must

THE NEW YORK FORESTS.

THE public mind in the State of New York is rapidly awakening to the very serious danger which threatens the State from the destruction of the northern woods. The agitation of the question began five or six years ago, and it has been pressed with such intelligence, persistence, and vigor that it is now a topic of general concern. The Governor has made it the subject of special recommendation, and several projects are pending in the Legislature for the care and disposition of the Adirondack woodlands. Fortunately Mr. [illegible] is interested in the question, and

The preservation of the forests and their restoration and care for public resort and recreation are the great ends in view, and no private advantage whatever should be considered, except as a necessary means of promoting the public benefit. It is a private interest—the extension of railroads—which is now among the chief dangers of the woods. The subject is of great importance, and fortunately the organization of the New York Forestry Association, which is designed to co-operate with the State Forest Commission and with all associations and persons that have in view the wise preservation of the forests, offers an opportunity for everybody to aid in the good work. The fee of membership is but one dollar annually; the payment of twenty-five dollars constitutes a life membership, and one hundred dollars, a patron. The office is at 52 William Street. The people of New York have signally demonstrated their public spirit by the reservation of the grounds at Niagara, and they will certainly rescue the Adirondack forests.

A CHANCE FOR YOUNG AMERICA.

THERE are no more intelligent, clever, quick, and capable workmen than Americans. In the discussions upon the tariff and wages, the quality and character of the American workman are always taken carefully into account. The great multitude of Americans, as in every country, work for their living, and the conditions of life in this country, and our political principles and system, tend to distribute wealth rather than to entrench it in families and social classes. In view of this character and competency of the American, it is curious to read in the census of ten years ago, the last taken, that in New York fifty-six per cent., in Chicago sixty per cent., and in Brooklyn sixty-nine per cent. of persons engaged in the trades were of foreign birth. The next census will show probably a still larger proportion. This result is largely due undoubtedly to the exclusion of boys from the trades. But from what source could trades be more effectively and beneficially reinforced than from young Americans? What workmen are more satisfactory? What public advantage is gained by their exclusion? These are questions which the situation has pressed more and more ur-

THE STRAUSS ORCHESTRA.

THE law of the 26th of February, 1885, to prohibit the importation and migration of foreigners and aliens under contract or agreement to perform labor in the United States, plainly requires amendment. The questions that have arisen under it show that more precise interpretation is necessary. Experience has proved that it is susceptible of the most ludicrous construction, which puts the country in a ridiculous light before the world. The kind of amendment required can be readily perceived by considering the object of the law. It is universally known to have been intended to protect laborers in the United States against the importation of foreign laborers under contract for service. The law was a propitiation of "the labor vote," and was designed to aid labor strikes by preventing the introduction of cheap foreign labor. Naturally, therefore, the act was loosely drawn, and when it was judicially decided that it prohibited a religious society from securing the services of an English clergyman, it was obvious that a construction could be placed upon the act which was wholly foreign to its purpose.

The same question has now arisen in another form which is equally grotesque. An engagement has been made with the famous STRAUSS orchestra in Vienna to give a series of concerts in this country next summer, and it is objected that the entry of the orchestra is forbidden by the law. If this were really the fact, it would be a conclusive reason for immediate amendment or repeal. But a simple, fair, and reasonable view of the law does not justify the view, although the fact that the question is raised makes the amendment most desirable. The fifth section of the act expressly provides that the prohibition shall not apply to professional actors, artists, lecturers, or singers. The condition is that these persons shall be professional actors, etc., not that they shall have any especial degree of proficiency or excellence or reputation. It does not require that a player shall be a KEMBLE or a KEAN, nor that a singer shall be a JENNY LIND or MALIBRAN, but only that he or she shall be a professional actor or singer, and so in the other cases. The question then arises does the phrase professional the Treasury shows an actual difference of opinion, and the act therefore should be so amended as to restrict it to its intention, which, as appears from the fourth section, is the exclusion of "any alien laborer, mechanic, or artisan" who has previously made a contract for work in the United States. The good sense of Congress will certainly see that the act as it stands is obscure and liable to great abuse.

THE BLAIR SCHEME.

It is possible that a vote upon the Blair bill may be reached in the Senate before this paper is issued. The general anticipation is that if Senators vote, and vote as they think, the support of the bill will be much weaker than heretofore. Eleven Republicans are believed to be unfriendly to the scheme, and possibly four more. There is no question of the fact that profuse public aid has been given to education in this country, and is still given. The public-school system in every State is public aid, and no money is more wisely expended. But the grant of money by the national government to the State government is a wholly different question. If it be constitutional, it is not necessarily expedient. When the people of a State tax themselves heavily to support their own schools, they will watch closely and carefully the expenditure of the money. But the evil results of indiscriminate alms are as obvious in grants from the public Treasury as in gifts from the private purse. The fact that there is a surplus is not a reason for gift giving by the national government. The real question is whether the purpose is such as would authorize Congress to levy a tax to raise the money. If not, the proposed gift is but an illustration of the mischief of a surplus, and an argument for reducing the revenue.

Moreover, the expediency of the Blair bill must be judged by its own provisions, not by an abstract principle of the desirability of promoting education. A good end is not an argument for unwise means. It is desirable to promote education, but it is still more desirable to foster self-dependence in every community. It is absurd to give six millions of dollars from the national Treasury to New York in order to give a proportional sum to Florida. The bill gives the money to the States upon the basis of illiterate population, but the States are to distribute it upon the basis of school population. The more the scheme is considered the more it seems to be a crude device to spend part of the surplus, and every plea for it encounters the inexorable fact that even if some of the grant might be supposed to be appropriated to its purpose and to relieve some illiteracy, the inevitable demoralization of the community would entirely overbear the benefit. No man knows more of the necessity of education in the Southern States than General Armstrong, of the Hampton school in Virginia, and when he says, "Take out the self-help, and the rest is not worth much," he tells the truth crisply, and states the principle which should govern all national pecuniary assistance.

The strength of the American system is local self-government. Whatever strengthens that promotes the general welfare. Whatever teaches the State to look to the national government for results which it should owe to its own industry, sacrifice, intelligence, and energy is a general misfortune. Senator Spooner, of Wisconsin, in opposing the Blair bill, quoted the President as saying, "Such aid should be, as it has always been, suggested by some exceptional conditions." Certainly in the great multitude of the States to which the Blair bill gives aid no exceptional conditions whatever can be alleged; and it is not easy to see, even if the bill should pass Congress, how the President could authorize by his signature a series of grants for which no necessity can be pleaded, in order to secure others for which necessity is alleged.

PAN-AMERICANA.

The Pan-American Congress has agreed upon the common principles which should govern the legislation of all American States in protecting the rights of literary, artistic, and industrial property. Literary and artistic copyrights, it is agreed, should receive the protection accorded them by the state "of origin," and patent rights should be registered according to the laws of the country in which recognition is asked for. This is amicable and pleasing. It is, however, recommendation only. No government is bound by the action of the Congress, even if unanimous. Even if a general scheme of friendly agreement should be proposed, it would be a sign of the good-will of the delegates, but nothing more.

The practical value of the Congress lies in the personal intercourse of distinguished and accomplished delegates from countries which have little association with each other. They can acquaint each other with the actual situation and condition of feeling in their respective countries, and they can learn, each for himself, the probabilities of reciprocal legislation. In really important matters, however, involving large pecuniary interests, it is obvious that valuable results are not to be anticipated. Chili undoubtedly would be willing to give our authors the same protection that they enjoy at home, and we should hardly hesitate to do likewise. Uruguay, also, would doubtless recognize our trade-marks upon similar courtesy from us.

But it is still open to question whether any of our South-American brethren would agree to pay us more for the same thing than they pay other countries. On the other hand, they might agree upon the desirability of a railroad through both the Americas, conveniently connected with all the chief cities in each country. But such projects are music in the air. The Congress ought to be at least a good school for the delegates. We shall soon know what it has done for the two Americas.

DO YOU BITE YOUR THUMB AT ME?

The tone of the New York press comments upon the Fair which the House of Representatives has conceded to Chicago is not strictly fraternal. Chicago is taunted in the lingo of the street boy with having bitten off more than she can chew. The Chicago suggestion that the Fair ought to be deferred until a later time than 1892, and that Congress ought to grant money as well as formally countenance the project, is reviled with sneers and jeers, and the great city of the West is told impressively that she has drawn a white elephant.

This is hardly according to the understanding. If we remember correctly, the New York orators in Washington disclaimed all jealousy or unfriendly feeling toward any contestant, and expressed the warmest desire to aid any rival in the great work if the choice should go against New York. At present, however, that disposition is apparently in abeyance. The proffers of interest, sympathy, and assistance, and the declarations that the marvellous child of the setting sun will easily outstrip the feats of Hercules in his cradle, are not so fervent as the eloquent speeches assumed. "The war, Mr. Speaker, does not come up to the manifesto."

It is, however, plain that if there is to be a Fair, it will require the utmost energy and industry of a united country to produce an exhibition which will surpass that of last summer in Paris. The standard was set there, and it will not be reached or excelled by gibes and indifference between New York and Chicago. We confess that we do not see what can be done about it. Perhaps a "compromise" might be suggested in the form of an American instead of an International Fair. That would be a graceful if somewhat belated admission by Chicago that a great seaport is most suitable for a World's Fair, while New York might courteously concede that an American Fair could not be held more fitly than in the city which is in itself one of the most prodigious products of America.

AN IMPORTANT BILL.

Mr. Lodge has introduced a bill providing for the appointment of fourth-class postmasters. There is no great public department which grows more rapidly, and which requires thorough reorganization more stringently, than the Post-office. It is the greatest of public business conveniences. Its duty is to receive and distribute promptly and accurately to every part of the country letters, newspapers, books, periodicals, and many kinds of portable merchandise. There is no political way of doing this, and the routine of the work does not change with the administration. Politics have nothing to do with it; and when they are brought into it they injure the work.

The bill introduced by Mr. Lodge divides the country into postal districts, and authorizes the Postmaster-General to appoint an inspector for each district.

> "Whenever a fourth-class postmaster is to be appointed in any of these districts, the district inspector shall give notice of this fact. Each candidate shall, in addition to his application papers, furnish a certificate signed by three citizens, declaring their belief that the applicant is a suitable person for the office, and no such certificate shall be signed by any person holding any Federal or State office. The inspector shall then send to the Postmaster-General all the papers received, together with a report, in which he shall grade all the applicants in the order of their fitness for office, according to the information obtained by him and from his inquiries. The Postmaster-General, upon receiving the report from the inspector, shall then appoint one of the candidates so reported. The Postmaster-General and the inspector shall prevent, as far as possible, any person from disclosing the political connections of any applicant. No appointment of a fourth-class postmaster shall be absolute until he has served one year on probation."

Honestly administered, this scheme gives every applicant an equal chance, and instead of the present system of appointment by the favor of the Representative of the district in Congress, it provides a system of selection by fitness and qualification. It has the merit, also, of confining the selection and appointment to the executive branch of the government, without reference to the legislative branch, which is unquestionably the Constitutional intent. The plan, however, like every plan, is susceptible of evasion and abuse, and it provides, like every plan, only indirectly against arbitrary removal. But it would be a very great improvement upon the present method; and the passage of such a bill by Congress would be a subject of general congratulation.

THE WELCH MEMORIAL FUND.

Everybody who knows the story of Philip H. Welch, the writer whose charming humor and sparkling gayety were the source of such constant and harmless pleasure, and who died a year ago in great suffering, but still smiling and making others smile, will rejoice to hear that the subscription for his family has been very generous, and that a sum of $25,000 has been placed in trust for his widow and children. It is the contribution of Mr. Welch's comrades in letters and of a multitude of distinguished citizens, who have thus gladly testified both their admiration for the heroic writer and their sympathy for those whom he has left. The happy result is largely due to the intelligent, persistent, and affectionate interest and energy of Mr. Edward P. Clark, of the *Evening Post*, and to the widow of Mr. Welch not the least valuable part of the result must be the tributes of high appreciation and hearty regard which accompany the gift, and which show the strong hold which her husband had taken of many hearts.

"PLEASANT ALL ROUND."

The letter from a very large number of citizens of Boston to the late Collector Saltonstall, upon his removal by President Harrison, was very significant. The signatures were those of the most representative men of every interest in the city, of all parties and views and pursuits. They commended the retiring Collector upon his conduct of the Custom-house, "for the first time in a generation" with freedom from partisan influence, "on business principles, by business methods, and by men trained in those principles and methods." Trusting and expecting that his successors will maintain the high standard that Mr. Saltonstall has raised, the signers of the letter credit him with the honor due to the pioneer.

The whole country is indebted to Mr. Saltonstall for the demonstration that the collectorship of Boston is not, as Senator Hoar calls it, a political office, and for showing that the principles of the conduct of the public service which the Republican platform of 1888 warmly commends, with a demand for their general application, are not only practicable, but productive of the best results. The President, also, although consenting to make spoils of the office, in deference to the alleged persistence of Senators Hoar and Dawes, must yet feel grateful to the officer who has illustrated to the satisfaction of all men the wisdom of the President's declaration that "fidelity and efficiency should be the essential test in appointment, and that only the interest of the public service should suggest removals from office."

The removal of Mr. Saltonstall by the author of this truthful remark has had the good effect of illustrating conspicuously to the country the truth of another remark by the same author, in which he describes such acts as Mr. Saltonstall's removal as "the frank and bold, if brutal, method of turning men and women out simply for political opinion." The platform of Mr. McKinley bitterly reproached misguided citizens who thought it possible that a Republican President could be capable of such conduct.

PERSONAL.

The annual income of John D. Rockefeller, the founder and head of the Standard Oil Company, is said to be about $6,000,000, which is equivalent to an accumulation of nearly $750 an hour. He gives away large sums for charitable and religious objects, but even with the demands made upon his generosity he is not likely to be beggared for some time to come. Mr. Rockefeller is fifty years old, and so thoroughly unpretending in his living and manners that no one meeting him in his daily routine would find an intimation of his tremendous business success. He was born in Cleveland, Ohio, and was modestly embarked in the produce business in that city before he literally "struck ile."

—Miss Amelia S. Given, of Mount Holly Springs, Pennsylvania, an heiress who is described as young and fair, has given the little mountain village where she was born a free library. The building is of the modern renaissance style, while the rooms are finished in Moorish designs and fitted with modern conveniences and comforts. A generous patronage of the library by the villagers has already shown how thoroughly they appreciate the gift.

—A very interesting collection of drawings in black and white by Alfred Parsons and Edwin A. Abbey is now on exhibition at Reichard & Co's., 226 Fifth Avenue. They comprise the originals of Mr. Parsons's illustrations to Wordsworth's sonnets published in Harper's Magazine, and of Mr. Abbey's illustrations of *Old Songs* and *The Quiet Life*. Their beauty, delicacy, and exquisite finish have been felt by thousands of art-lovers in both hemispheres; and as these originals are now offered for sale, the opportunity to possess some of them is likely to be eagerly and extensively embraced.

—The Czar of Russia owns about fifty million acres of land, and may claim to be the largest real-estate owner in the world.

—Emperor William probably has a grudge against the Sultan of Turkey, as he has sent him a gift of twenty-four kettle-drums for use in his army, which has gotten along very well through all these centuries without such implements of warfare.

—Sir Robert Hart, one of the most influential men in the Chinese Empire, was a student in Queen's College, Belfast, when ex-President McCosh, of Princeton, was a professor there. Young Hart was graduated with high honors, but, being too poor to study for a profession, he obtained a place in the consular service in China. He rose to be a high mandarin, and was in time appointed British Ambassador. Queen Victoria made him a Baronet in recognition of his valuable services, and he has now established a university for the education of the Chinese.

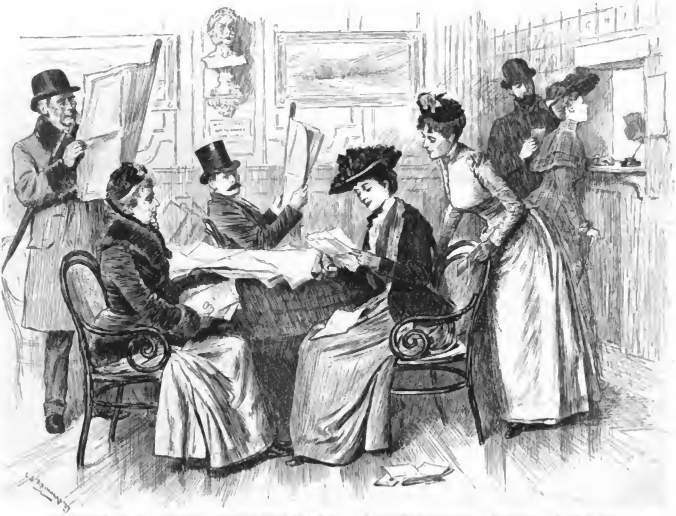
—Edwin Arnold is making a long stay in Japan, and has begun to learn the language, while Robert Louis Stevenson has bought a plantation of several hundred acres near Apia, Samoa, and talks of making the island his future home.

—The late Rev. Dr. Anderson, of Rochester, was a man of fine presence, and in his prime possessed the strength of a giant. When President of Rochester University he not infrequently checked college rows by mingling with the combatants and adopting physical force till moral suasion could be brought into play. His resemblance to Garibaldi was so striking that when in Italy at one time he was enthusiastically cheered by supporters of the great liberator, who mistook him for their leader.

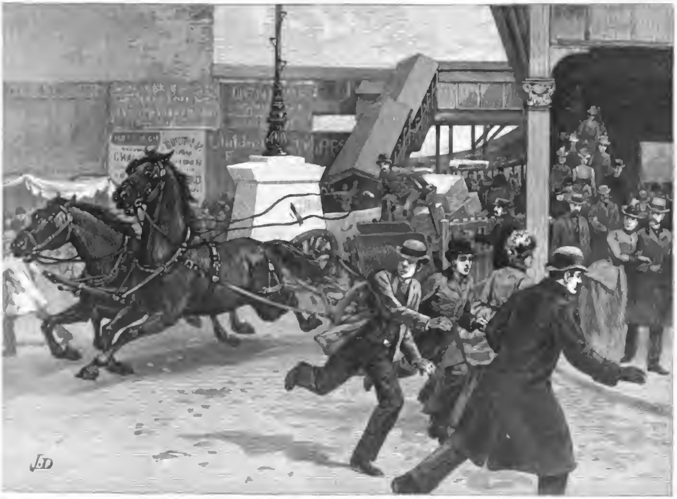
—John Caldwell, a veteran of the 1812 and Florida wars, has just died in the Soldiers' Home in Kearney, New Jersey, at the age of one hundred and six years.

—Edwin Booth has generously contributed $1000 toward a fund in memory of Mrs. J. R. Vincent, the actress, which is being raised at Boston to provide free beds for working women and girls in one of the hospitals of that city.

—Ralph Disraeli, a brother of the late Earl of Beaconsfield, has just resigned his place in the House of Lords as Clerk of Parliaments, after being for forty-nine years in the British civil service.



AMERICANS ABROAD—READING LETTERS FROM HOME AT THE BANKER'S.—Drawn by C. S. Reinhart.—[See Page 210.]



A RUNAWAY ON THE BROOKLYN SIDE OF THE EAST RIVER BRIDGE.—Drawn by John Durkin.—[See Page 211.]

which germinated so readily had been long since sown.

Of all the disabilities under which we then labored, the most serious was the lack of an adequate supply of arms. The great arsenal of the Aztlanecas was in Culhuacan; and thus nearly the whole of the supply of munitions of war in the valley was in the Priest Captain's hands. Fortunately, the shipment of hardened gold that we had intercepted—by landing at the pier whence in a few hours it would have been despatched to the Treasure House—give us a good supply of raw material out of which spear heads, and the heads of darts, and swords could be made; and night and day the forges blazed in Huitzilan while the manufacture of these weapons went on. Of bows and arrows, it was not possible to make many in that short time; but of slings there was no difficulty in making enough to supply our entire force—and among these people, who are wonderfully skilful in the use of it, the sling is a most deadly implement of war. We lacked time, also, to make any large number of shields, and our deficiency in this respect was regarded by Tizoc and by all the military officers who were with us as a most serious matter; for not only would our men without shields be the more easily slain in battle, but their fighting value would be lessened by their consciousness that they were without this piece of furniture that all savage races hold to be so necessary in war.

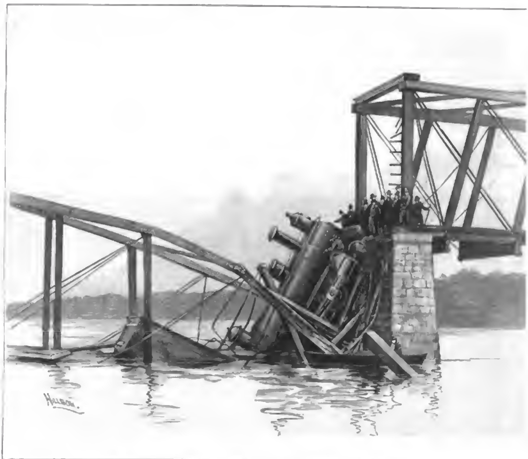
However, of defensive armor we had a good supply; for it chanced that in the Citadel there was a great store of cotton cloth suitable for making long kirtles of many thicknesses of cloth quilted together; which kirtles were arrow proof, and well protected a man from his neck downward almost to his knees. Young was disposed to think but lightly of this curious armor; but when Tizoc, to convince him of its utility, demonstrated its power to resist a well-pointed arrow shot at very short range, he was forced to confess its entire applicability to the purpose for which it was designed.

"Tell th' Colonel that I give in, an' think it a first-rate notion, Professor," he said. "But if you can get it into his head, an' I'm afraid you can't, just tell him that when this barelegged army of ours gets fitted out with those little night-shirts they'll look for all th' world like a lot o' fellows who've scrambled out of a hotel that's caught fire in th' middle o' th' night. All that 'll be wanted t' make th' thing perfect 'll be a couple o' steam fire-engines an' a crowd with all their clothes on, an' a line of policemen. I guess it's goin' t' be one o' th' funniest lookin' armies that was ever seen outside of a lunatic asylum. What I'd like to do, Professor, instead of tryin' t' do any fightin' with it, is just t' take th' whole outfit back t' th' States an' make a show of it. I'd get Benito Nichols t' go in with me—he's a first class man, Benito is, an' he's a boss hand as a show manager—an' we'd call it 'Th' Aztec Warrior Army an' Circus Combination,' an' we'd just rake in th' dollars quicker'n we could count 'em. That makes me think of that show we were talkin' about makin' with Pablo an' his burro." Young's voice changed as he spoke and there was a huskiness in it as he added: "I s'pose by this time there ain't much left for show-makin' purposes of either of 'em. No, I guess I'll stay around an' take a hand in any fightin' that's goin' on; for I'd pretty near be willin' t' be killed right away after it myself for th' chance t' square things with that old devil for killin' our boy. He was a good boy, Professor, an'— How this devilish dust does get into my eyes an' make 'em water!" With which highly irrelevant remark, for their was no dust blowing just then, Young suddenly ceased speaking and walked away.

This was the only time that we spoke of Pablo while we lay at Huitzilan, for talk about the boy only increased the bitter sorrow for him that was in all our hearts. As for my own heart, it was wellnigh broken as I thought that but for me his gentle life would still be flowing on smoothly, as I had found it flowing when in an evil hour I joined his fortunes with mine, and so had brought him to so untimely and to so cruel a death. And I too longed for the fighting to begin that I might avenge him, for the accomplishment of which vengeance I was not merely in part, but altogether ready to yield up my own life.

Indeed, excepting only Fray Antonio, who saw in warfare only the wickedness and the cruelty of it, we all were most eager for our inaction to end and for the battling to begin that would give us opportunity to let the life out of some of those by whom Pablo had been slain. It was with delight, therefore, that we noted the rapidity with which the preparations for the impending campaign were carried forward, and saw how each day the disorderly host that had been gathered at Huitzilan was changing from a confused mass of good fighting material into an organized body adapted to the needs of war. It was, in truth, astonishing to us—for we could not well comprehend how essentially warlike were the instincts of this people, and how quick, therefore, they must be in military matters—to observe the promptness that was shown in getting our army in readiness for the field. And with our astonishment came also a comforting conviction that the force that showed such steadiness in falling into organized form must surely hold well together and fight well together when the hour for fighting came.

[TO BE CONTINUED.]



THE SCENE OF THE RECENT RAILWAY BRIDGE ACCIDENT AT PEORIA, ILLINOIS.

STRENGTH IN RAILWAY BRIDGES.

In a country made famous quite as much by the skill and ingenuity of its workers in iron as by the achievements of any other branch of human industry, it would naturally be supposed that railway bridges would be so constructed and maintained that accidents to them would be of rare occurrence. That this is far from being the case, however, is shown in the yearly record of railway accidents, the statistics of which indicate that the most appalling disasters occur on bridges or other elevated crossings. It is difficult to determine why this should be so, except on the general assumption of defective construction and inferior material. The recent disaster at Peoria, Illinois, where a span of a bridge over the Illinois River gave way under the weight of a freight train, is hardly explainable on this supposition. The bridge in question was supposed to be as safe as railway bridges can be made. It was constructed of iron, upon principles approved of by the best engineers in the country. It was inspected regularly by men employed for such purposes by the railway company that owned it, and as it had borne the weight of passing trains for years without sign of weakness, it was supposed to be perfectly safe. Yet there was a weak point somewhere about it, for a freight train rolled out upon it one night recently and crashed through into the river. Some of the train men lost their lives. The engineer was pinned in the wreck, apparently unhurt, with his head above the surface of the water, but while the rescuing party was trying to liberate him he died from the effects of cold and exposure.

The lesson to be learned from the breaking of this bridge is not a cheerful one, nor does it tend to increase the peace of mind of persons who travel on railway trains. If this costly and carefully constructed bridge gives way under ordinary pressure, with what feelings of apprehension must the traveller cross other bridges that may be no stronger, and, perhaps, not so apparently safe? The occurrence suggests not only a more rigid inspection by the railway officials, but also a governmental inspection similar in character to the inspection of steam boats.

Theoretically the chief fault of bridge building is the employment of inferior engineers. Practically, however, there are other things to be taken into account. Under favorable conditions an inferior engineer may construct a good bridge, whereas under unfavorable conditions a good engineer may put up a weak bridge. In the last-named case there are sure to be circumstances over which the engineer has no control. The exigencies of railway building may require him to span a stream with a completed bridge in less time than ought to be required for the preparation of the foundations. When a railway company is laying track against time for the sake of protecting a right of way, or when it is seeking to head off a rival corporation, as often occurs in the Western States, the construction department cannot be expected to do its best work. The hastily constructed bridges and trestles are rarely rebuilt, because of the increased cost, although they may be strengthened from time to time, as circumstances seem to demand. Work of this kind is never actually safe.

Even with plenty of time at his disposal, the good engineer may build an unsafe bridge, by using poor material in parts subjected to the greatest strains. No man would do this knowingly; but in all bridge-building materials, and especially in iron, there are at times defects that the human eye cannot see. A defective iron girder or cross-beam may last for years before it yields to the jar and weight of passing trains. Usually defects can be detected by careful inspection before the material leaves the iron foundry, but in cases where this is not done the bridge builder is often able to do it while the beams and girders are passing through his hands. If the defects escape the notice of both the manufacturer and the builder, they may be picked out by the railway inspector when the bridge is in position. If this be not done, there is little chance that the defects will be noticed until the bridge breaks.

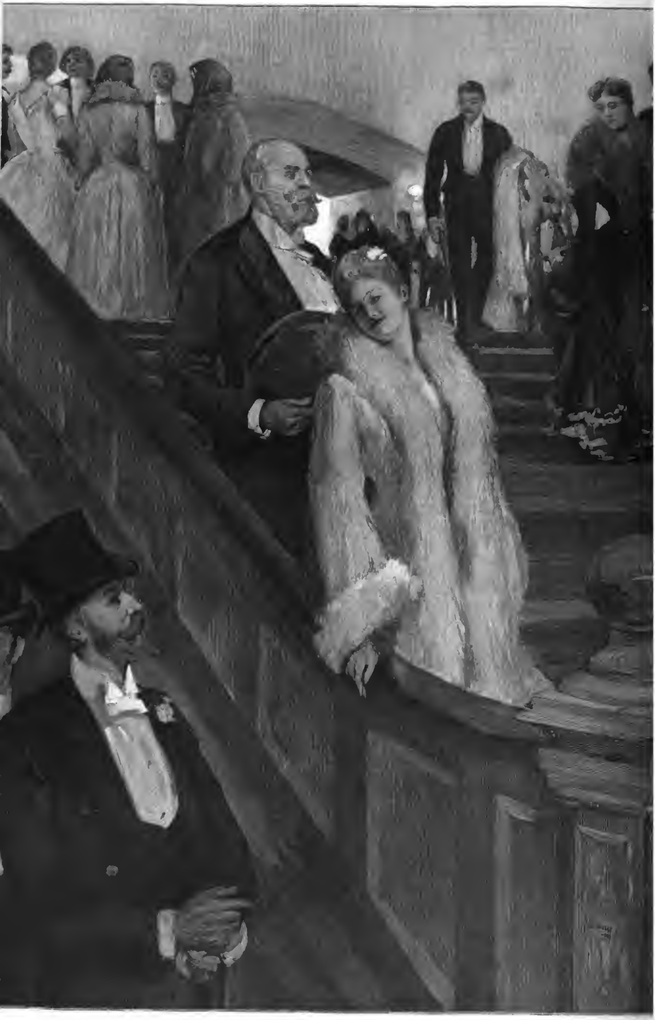
It must be acknowledged that the average inspection of railway bridges is not what it should be. Too often the division road-master, who is rarely an expert, makes the inspection by passing over the line on a hand-car or construction train. He sees that the bridge is just where it was the last time he saw it, and for all that he can tell it is in exactly the same condition. He looks at it with a wisely critical air, pronounces it to be in first-rate shape, and goes on. The next train that comes along may crash through the bridge and kill a dozen men. The uncertainty of road-masters' inspection was strikingly shown a few years ago on a railway leading into New York. The new president of the road caused an expert inspection of the bridges to be made, with the surprising result that every bridge on the line was condemned as unsafe. The road-masters, however, had declared the bridges to be perfectly safe only a week or two before!

A good engineer will see to it that the bridge is constructed upon correct principles, that good material is used, and that the structure is carefully and properly put together. Strength is naturally the first consideration with a good engineer. Railway bridges are usually made ten times as strong as the necessities of the case demand. The great New York and Brooklyn suspension bridge has a strength only seven times in excess of the demand. With the maximum of strength in view, the railway bridge engineer seeks to secure a minimum of weight. Useless weight merely makes a bridge unnecessarily expensive, and adds nothing to its utility. A bridge may be made so heavy that it will fall of its own weight. It is the shape of the iron, more than the weight of it, that makes a bridge strong. Iron in tubular form or in T shape will stand a much greater strain than solid iron. Tubular bridges are growing in favor in all parts of the world, and are likely to become even more popular as the public demand for safer bridges grows more urgent.

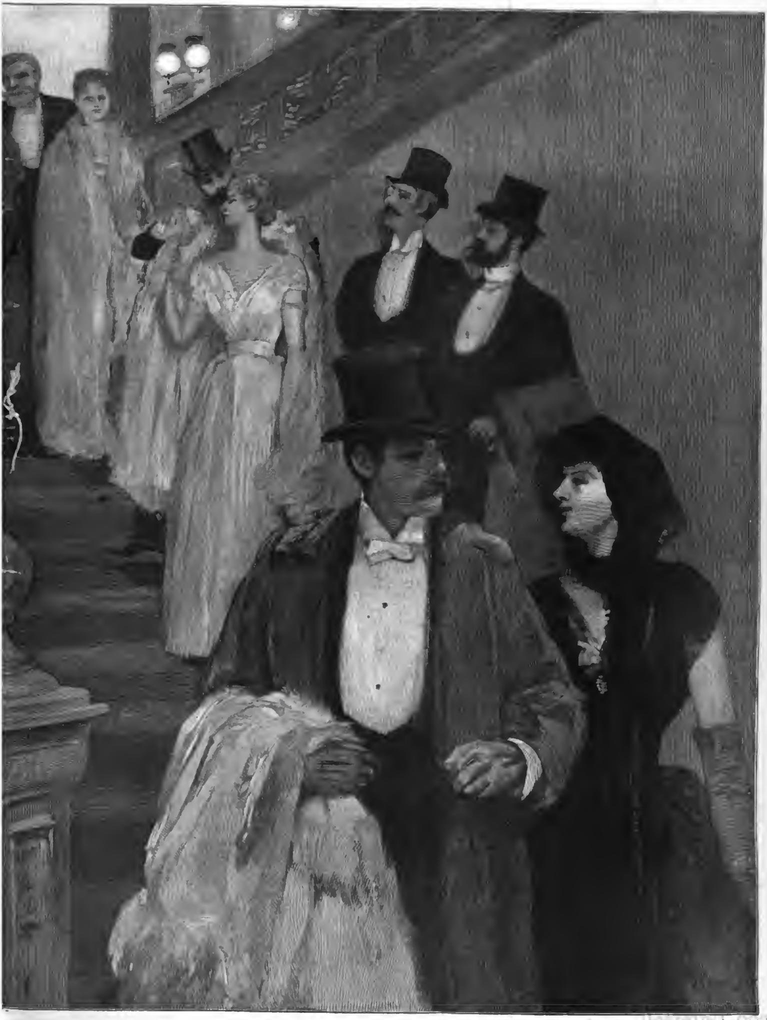
The recently broken Peoria bridge, as shown in the illustration, gave way only at one end of a span. The rest of the span held together after it had fallen, which is a circumstance showing that the structure was originally very strong. The method of construction indicates that it was the work of a competent engineer. With expert inspection and timely repairs the bridge should have stood for many years.

AFTER THE OPERA.

When the opera is over there is no particular confusion and bustle on the part of the occupants of the boxes in going away. Some are content to prolong the conversation begun a long time before, and continued uninterruptedly throughout the performance, much to the disgust of the enthusiasts; while others hold impromptu receptions in the anterooms adjoining the boxes, or in the wide corridors. But all the time there is a continual stream passing up and down the broad staircase, a desultory dress parade of society, so to speak, while the reviewing officers stand in a row against the wall, and, noting all with critical eye, pass judgment upon the people, the opera, or the world in general. The stranger is almost tempted to inquire whether the wall-flowers take that position to see or to be seen; perhaps the advantageous position is chosen on account of its being able to combine both reasons. It is this time of the evening that Mr. Sterner so ably pictures. Through the open door at the head of the stairway the light from the well-lit house is streaming, but below, at the turn of the stairs, the light has grown dim and the faces are more or less in shadow. The group in the corridor above gives no sign of immediate departure, and the couples on the stairs are characteristic of the departing audience. There is a general listlessness about the ladies—one waiting to have her wrap adjusted, another leaning on the balustrade and surveying the scene with a languid air, while the third, who has reached the landing, looks back for a moment to catch the last glimpse of those above. There is more life and activity in the two men who ascend the stair, just emerging from the shadow beneath. They seek a friend, or go to join a party they had left before, and the contrast in the action of the respective figures going and coming is well preserved. The whole picture is just such a one as may be seen after the opera during the height of the season, and Mr. Sterner has faithfully reproduced the interior of the Metropolitan Opera house, New York. Outside, the city street is dark and noisy, the carriages are rattling over the stones, and there is a general activity and bustle—the opera is over.



AFTER THE OPERA.—Drawn



A. E. STERNER.—[SEE PAGE 203.]

case for the benefit of the profession, but I am now old, and that duty has been kept unperformed by others more pressing, so I gladly give you my minutes in order that the main facts of so strange a case may be preserved." And this is the case:

The prisoner, George Rothman, a stalwart young man under thirty, was the only child of parents who were poor and respectable. That is to say, his father, who was a farmer, was obliged to rent the land he cultivated, and no charge of a criminal nature had ever been made against him, and his mother was a worthy old woman, who raised chickens for market, milked her own cow, made her own butter, went diligently about her own business during the week, and praised God in a calico frock, with a little black bonnet on her white hair, and a pair of gold-rimmed spectacles on her nose, on Sunday. George Rothman himself had spent the greater part of his life on the farm with his father. He had grown to be a fine-looking fellow, his broad shoulders, black hair and mustache, and flashing eyes being much admired by the country lasses in his neighborhood. He too had borne a good reputation, though he had sometimes subjected himself to censurable remarks by his drinking and merry-making. There was apparently something of a spendthrift about him, and naturally there were some prophets thereabouts who had said he would come to grief. When he was arrested and imprisoned, however, the community was greatly shocked. Then a few of the prophetic souls came forth, saying "I told you so" and the philosophical were heard to say, "There is no telling what dissipation will bring a man to"; and the moralists said, "If he had never fooled with whiskey, he had never come to this."

II.

The prisoner was arraigned upon an indictment containing three counts: one for burglary, one for murder, and one for arson. The penalty for each offence was death, and the indictment was drawn in this way probably to make more certain the execution of the supposed criminal; for if he avoided the death penalty under one count, he might still be convicted on another. A special venire of fifty men was ordered in his behalf. Three days after his arraignment his case came up for trial. The usual formal and tedious questions were put to the veniremen to test

her next thought was one of personal safety, of escape from the murderous man. There was an old-fashioned hand loom in the sitting room, and she endeavored to crawl under this for shelter. Just as she had got on the inside of the loom, however, the man gave her a terrible blow on the head with the butt end of the gun, which knocked her flat upon the floor and made her unconscious. She lay there, how long she could not say, but at length was brought to consciousness by a sense of intolerable heat. The house was on fire, and the clothes upon her husband's body were in flames. She tried to get up, but could not. Somehow she dragged herself to her husband's body, and tried to smother the flames upon him with her hands and a rug that lay upon the floor. She partially succeeded, but burnt her hands dreadfully in the effort. Then she took hold of the body, and tried to drag it to a door opening into the yard. It was in vain. She had scarcely strength enough to move herself, and though she tried repeatedly to advance her husband's body in the desired direction, she fell back more exhausted with each succeeding effort, and without any success. By this time the house, which was frame, was fairly ablaze, burning timbers were beginning to fall around her, and she saw that it would be certain death for her to remain where she was longer. Hastily she crawled in despair and grief and fright across the floor to the outer door. There she paused and looked back at the body of her husband. The flames had spread over it again, and the floor around it was ablaze. There was a crash as she looked; the upper floor gave way, and a heap of burned timber fell upon the body and hid it from her view. Then she hastened through the door, down the steps, and across the yard for safety. The rain was pouring in torrents, the ground was covered with ice, and it was cold, very cold.

What happened after that, that night, she did not know.

In answer to further questions she said her husband was a farmer and cattle dealer, and was accustomed to keep a good deal of money about the house. At the time in question he had there about $300. She was certain of this, because she had seen him count the money that night, and heard him say he had about $300. He kept money on hand to pay the running expenses of the farm and to carry on his trade as cattle buyer. That he kept

had stoutly protested his innocence at the preliminary hearing, and had ever since maintained that he was nowhere near the Flammer residence on the night of its destruction.

Harvey Wright, a constable, testified that on the third day after the burning of the Flammer residence he found a gun, the stock of which was cracked, in a hedge near the Walnut Grove Church. In the crack in the gun's stock were several long black hairs, apparently from a woman's head. He had the gun in court, and the jury could see it just as he found it. Both barrels were empty.

III.

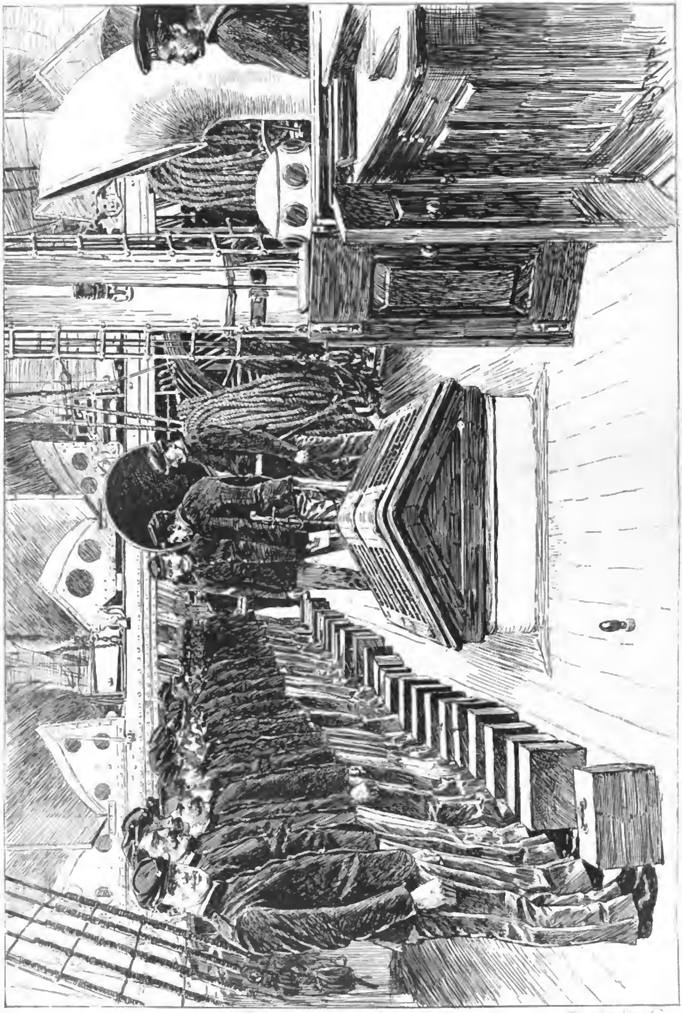
The solicitor here arose, and announced that the State's testimony was concluded. Many eyes then turned toward the prisoner and his counsel. The case seemed plain and very strong for the State, and hopeless for the defence.

The prisoner himself went on the witness stand. Answering questions put to him by his counsel, he said that on the morning before the burning of the Flammer residence he had gone to see Mr Flammer about the sale of some cattle. His father had some cattle he wanted to sell to Mr Flammer. The last planting season had been very bad, money was scarce, and the cattle had to be sold to keep the family in supplies. Mr Flammer would not buy the cattle. While talking with Mr Flammer on this subject, a negro man came into the sitting-room, where they were, and spoke to Mr Flammer about pay for labor on the farm. Mr Flammer got up, went to the centre-table, took a white cloth bag full of money, and gave the negro some silver. The witness had seen that bag of money in Mr Flammer's possession once or twice before, and knew by hearsay that he was in the habit of keeping considerable money in the house. That was the last time he ever saw Mr. Flammer. During the afternoon of that day he was hunting, and from eight o'clock to eleven that night he was at the house of Mr. August Merrifield, a neighbor, in conversation with Miss Maggie Merrifield, that gentleman's only daughter. He was not within three miles of Mr Flammer's house on the night of its destruction. The morning after the fire, immediately after breakfast, he went to town, came back, not having heard of the tragedy, and that was why he was out at the [illegible] with

prisoner during the [illegible] speeches. The prisoner's counsel, it is true, brought a little temporary sunshine into the dark case. He dwelt eloquently on the consistency of the theory and testimony set up on the prisoner's behalf. He urged that the prisoner could not have done the deeds charged against him, that he was at home while the Flammer house was burning, and especially he called attention to the fact that no trace of Mr Flammer's money had ever been found on the prisoner, and it was plain that to get the money was the object of the perpetrator of the awful crimes—burglary, murder, and arson—that were charged in the indictment.

But the solicitor's speech soon extinguished the sunshine, and brought back the dark clouds over the case. He said that the plain, unmistakable facts were all against the accused; that Mrs. Flammer had positively identified him as the man who had fractured her head with a gun, and it was for the jury to say whether or not it was that person who broke into her residence, murdered her husband, and put the torch to the dwelling, and perhaps to the very corpse of one of the victims, in order that no tongue could ever tell who had done the dastardly deeds! "Of course," said he, "the prisoner's mother is certain the prisoner did not leave her house after eleven o'clock on the night in question, but you know, gentlemen of the jury, that her testimony is highly colored by her affections; that women of her age and habits sleep soundly often, and it is quite probable that the accused had gone out of the house, shoes in hand, noiselessly, so that his parents could not hear him. It is plain that after eleven o'clock that eventful night he had gone to the Flammer residence and committed the crimes with which he was charged."

At the conclusion of this speech, which was long, exhaustive, and convincing, the judge charged the jury. He called particular attention to the fact that the prisoner in going upon the witness stand to testify in his own behalf had put himself in the attitude of an interested person, that his testimony was to be taken guardedly, for the reason that his life was at stake, and he was naturally inclined to pervert the truth in his own behalf. Concluding, he said, "If, after considering the testimony of Mrs. Flammer, who swore positively to the identity of the prisoner, and the other evidence for the State, including



INSPECTION OF MARINES ON THE UNITED STATES MAN-OF-WAR "CHICAGO."—Drawn by T. de Thulstrup.—[See Page 210.]

get caught at it, his turn at the gangway came too often to let him feel kindly toward the persons who had reported him. This dislike was often encouraged by the officers, at least negatively, and for what they called "the best interests of the service." In some ships the marines were isolated from the seamen by a line as clearly cut as that separating the officers and enlisted men, and any association was discouraged as tending to impair the discipline.

Measured by our standards, the traditions—there were few regulations—in force were onerous in details. The will of the captain was the main spring, and as his school had been the knock-down and drag-out ethics of might and power, punishments were frequent and summary. Of course the spirit of the day was the outcome of a hard life, where battles, wrecks, pirates, blockade, and cat-o'-nine tails were a part of all extended sea experiences, and the wonder grows that there was not so little but so much humanity aboard.

"A few words," writes Admiral Ryder, of the Royal Navy, "will describe a sailor's life on board a man-of-war, such as it was in the memory of many living men. No leave to go on shore from the day the ship was commissioned until paid off. No wages until paid off, but occasionally prize-money. The ship filled with prostitutes in every port by permission of the commanding officer. The majority of the able and ordinary seamen and many petty officers got drunk on every opportunity, viz., when their boats went on shore, or by smuggling liquor on board, or by saving up their daily allowance. Flogging was a weekly, almost a daily, occurrence. It was almost certain that somebody would be drunk at evening muster, and punishment was flogging at 11.30 next forenoon. The men, as a rule, could neither read nor write. They were brave as lions, and generous, if utter recklessness with their money when they got it could be called generosity. After a three years' commission men had received from £80 to £100 pay alone, irrespective of prize-money. As a general rule, they lost all their money the first night after the ship was paid off, and the penniless men re-entered for another term of service. Such was a seaman's life, but all this is now changed."

It can be easily imagined that the lot of the marines under such circumstances was not a happy one. Their constabulary duties

constant and tremendous exercise of hunting or chopping wood for the fire, the novel surroundings in the forest or the camp, all tend to make a man say as hearty a grace over salt pork as he ever did at home before a holiday dinner. Where we were, up the Ottawa in the Canadian wilderness, the pork was all fat, like whale blubber. At night the cook used to tilt up a pan of it, and put some twisted ravellings of a towel in it, and light one end, and thus produce a lamp that would have turned Alfred the Great green with envy, besides smoking his palace till it looked as venerable as Westminster Abbey does now. I ate my share seasoned with the comments of Mr. Frederic Remington, the artist, who asserted that he was never without it on his hunting trips, that it was pure carbonaceous food that it fastened itself to one's ribs like a true friend, and that no man could freeze to death in the same country with this astonishing provender. We had canned tomatoes and baker's bread and plenty of tea, with salt pork as the *pièce de résistance* at every meal. The weather was unsuitable for hunting during nearly a week, and I know now—though I would not have confessed it at the time—that mixed with my admiration of salt pork was a growing dread that in time, if no change offered itself, I should tire of that diet. I began to feel it sticking to me more like an Old Man of the Sea than a brother. The woodland atmosphere began to taste of it. When I came in-doors it seemed to me that the log shanty was gradually turning into fried salt pork. I could not say that I knew how it felt to eat a quail a day for thirty days. One man cannot know everything. But I felt that I was learning.

One day the cook put his hat on, and took his axe, and started out of the shanty door with an unwonted air of business.

"Been goin' fish," said he, in broken Indian. "Good job if get trout."

A good job? Why, the thought was like a floating spar to a sailor overboard! I went with him. It was a cold day, but I was dressed in Canadian style—the style of a country where every one puts on everything he owns, all his stockings at once, all his flannel shirts and drawers, all his coats on top of one another, and when there is nothing else left, draws over it all a blanket suit, a pair of moccasins, a *tuque*, and whatever pairs of gloves he happens to be able to find or borrow. One gets a queer feeling with so many clothes on. They seem to separate

vainly. But while I [illegible] my [illegible] grew impatient, and cut himself a new hole out over deep water. He caught a couple of two-and-a-half pound brook trout and a four-pound gray trout, and I was as well rewarded. But he was still discontented, and moved to a small opening into a little bay, where he cut two more holes. "Eas' wind," said he "fish no bite."

I found on that occasion that no quantity of clothing will keep a man warm in that almost arctic climate. First my hands became cold, and then my feet, and then my ears. A thin film of ice closed up the fishing holes if the water was not constantly disturbed. The thermometer must have registered ten or fifteen degrees below zero. Our lines became quadrupled in thickness at the lower ends by the ice that formed upon them. When they coiled for an instant upon the ice at the edge of a hole, they stuck to it, frozen fast. By stamping my feet and putting my free hand in my pocket as fast as I shifted my pole from one hand to the other, I managed to persist in fishing. I noticed many interesting things as I stood there, almost alone in that almost pathless wilderness. First I saw that the Indian was not cold, though not half so warmly dressed as I. The circulation or vitality of these sciolsts of nature must be very remarkable, for no sort of weather seemed to trouble them at all. Wet feet, wet bodies, intense cold, whatever came, found and left them indifferent. Night after night, in camp, in the open air, or in our log shanty, we white men trembled with the cold when the log fire burned low, but the Indians never woke to rebuild it. Indeed I did not see one have his blanket pulled over his chest at any time. Woodcocks were drumming in the forest now and then, and the shrill, bird-like chatter of the squirrels frequently rang out upon the forest quiet. My Indian knew every noise, no matter how faint, yet never raised his head to listen. "Dat squirrel," he would say, when I asked him. Or, "Woodcock, him calling rain," he ventured. Once I asked what a very queer, distant, muffled sound was. "You hear dat when you walk. Keep still, no hear dat," he said. It was the noise the ice made when I moved.

As I stood there a squirrel came down upon a log jutting out over the edge of the lake, and looked me over. A white weasel ran about in the bushes so close to me that I could have hit him with a pea-nut shell. That

harassing. The post-office clerk is not paid to be a polyglot. Not being a Mezzofanti, he is not to be blamed for the hesitancy he displays before he can assimilate your name as you are pleased to pronounce it and the written characters as found on the letter. The Postlethwaites, the Dougherties, even the plain sailing Whites, have been known to have wrestled for hours with an entire Italian post-office before obtaining their respective letters.

All bankers abroad in large cities to whom letters of credit are addressed in favor of American tourists have rooms where travellers can find newspapers and sit and read their correspondence. These rooms are usually contiguous to the office, where is the special clerk who attends to the delivery of letters addressed to the care of the house. The memory of this clerk is excellent, and he generally speaks many languages. He must have the special gift of remembering the faces of the numerous clients. This letter delivery assumes at certain seasons the functions of a regular post-office. The house has to bear in mind the innumerable itineraries of tourists, and follows closely directions given as to the forwarding of correspondence. A special book is kept in which the instructions are preserved. "I will be in Rome up to the close of February, and please send everything there addressed to me, and I leave Rome in March, and will be in Naples for a week, and then send letters to Constantinople; and in April I shall probably be in Cairo or Jerusalem, and will write you; and don't forget to forward every scrap, newspapers and all."

It is when tourists return to the great European centres, and letters await them, that they hasten to their banker's. They cannot wait for the house to forward them their correspondence to their hotel or lodgings. Sometimes there is the happiest of hours passed in these reading rooms. The young woman to whom even Paris, Florence, Naples, were hardly sufferable, so steeped were they in gloom, sees the sun once more, for the letter so long waited for from him has come, and that silly lovers' quarrel which parted them is now forgotten. It is the mother who hears from her married daughter in Montana, and there is another grandchild; or, alas! death has come; the dread notice, with the black-bordered envelope, is handed, and its contents read in agony.

STANFORD LIBRARIES

RUNAWAYS ON THE BROOKLYN BRIDGE.

THE problem of runaways early became a subject for consideration on the part of the authorities of the Brooklyn Bridge. The number of these mishaps range from three to eight a month. Formerly they were more numerous. It is not altogether clear what the decrease is to be attributed to, but the presumption is that a beneficial education of both drivers and horses has been going on with reference to the vicissitudes peculiar to the bridge travel. The chief causes of the runaways are the breakage of harness, or the striking of the horses by the wagon when going down the incline at either side of the elevated centre, in consequence of badly regulated, or the absence of, breeching. It is possible that they are sometimes caused by the passing trains on the cable road, but the bridge officers think that this is rarely, if ever, the fact. In many cases no satisfactory reason for the occurrence is ascertained, as the stories of most drivers, when the question of their own carelessness is involved, are not to be relied on.

One definite conclusion that was some time ago reached by the trustees was that it would be wise to place strong gates at the exits of the roadways, in order that the frightened teams might not plunge with their vehicles into the busy streets at the ends of the great structure. Some of the members of the Society for the Prevention of Cruelty to Animals at first protested against the use of these barriers for the horses to throw themselves against, but it has been amply demonstrated that there would be much more cruelty in permitting them to go on than in thus stopping them. Where there has been time to securely close the gate neither a human being nor a horse has been killed. On the other hand, in one instance where the horse was not checked in this way, a woman who was trying to save her child was knocked down in the street by the animal and killed. In another case a runaway team dashed from the bridge exit into a street car, and wrecked it.

There is a telegraph system on the roadways, provided with knobs at certain intervals. A pressure on one of these by an officer at his post notifies the gate-man that a runaway is coming, and to act accordingly. At times the situation becomes critical when near the exit for the gate to be closed properly. In an accident which recently occurred at the Brooklyn end of the bridge, a picture of which is printed in this issue of the WEEKLY, this was the case; and the situation was complicated by the wagon being caught between the gate and the wall, and the horses—who were frightened by another runaway team in the rear—breaking away. Fortunately they were soon stopped, and no one in the street was injured. In respect to the runaways that take place nearer the centre of the bridge, the situation is much the same as that of a narrow street where the vehicles are all going one way and there are no pedestrians. The career of the horses is usually short, owing to the amount of traffic that is in the way of their progress, but more damage is likely to ensue than at the gates. Those riding over the bridge in wagons or carriages, who are inclined to apprehend danger from runaways, may find comfort in the fact that the percentage of them to the vast number of teams that cross is exceedingly small, and that those which do occur are generally of little consequence.

A BRIEF SPELL OF WINTER.

THE present season has done much to confirm the impression which prevails among the older inhabitants that since they were young a climatic change has taken place in New York winters. It has certainly been many years since the old-fashioned stage-sleighs, with their four horses, traversed the streets of Gotham; or since, with the possible exception of the memorable blizzard, snow has lingered long enough on the roadways to make it worth while to bring them out if they were still in existence. The story of people crossing the East River on the ice has assumed an almost legendary character.

The first snow of any consequence on Manhattan Island this year did not fall until the first of March. It was followed by another snowfall several days after, and on these occasions the city put on the traditional garb of the season, and was reminiscent of old times. Those possessing sleighs quickly seized upon the short opportunities to make use of them. This phase of winter is seen at its best in New York in Central Park, and on our first page is finely portrayed a feature of it which speaks for itself. The smooth roads of that public domain present a much more invigorating sight when there is sleighing than at other times. The preternatural solemnity which most people put on for some inscrutable reason when riding in carriages for pleasure largely disappears under the influence of the keener enjoyment.

The scene in the Park at the times noted showed what little encouragement in the way of a steady, real winter is would require to make the sleighing season in New York a brilliant one indeed. The fine driveways, with their agreeable grades and curves, the great number of horses owned by private individuals and by livery-stable proprietors, largely with reference to Park uses, and, more than all, a certain quality in New York society which responds readily to the chance of enjoying the exhilarating pastime, would produce a wonderfully lively and inspiriting result if there were a reasonable prospect of snow enough to warrant suitable preparations. Even when there is so brief an incentive to own sleighs, the turnout is a fine one. Old-fashioned types are numerous, but there is a wide variety of all kinds, with a notable prevalence of the Russian, with its plumes and distinct character generally. It is to be doubted if dealers have sold any new sleighs whatever this winter for use within the city limits. Prominent carriage manufacturers keep a few of them on hand simply for the sake of completeness in stock, and not to be found lacking by a chance but little expected customer. Some liverymen keep them for the same reason, and do not count on them as a source of profit. This feeling does not prevent them, however, from charging at least double carriage rates for their hire, and in many cases as much more as the traffic will bear. The large majority of the sleighs that are seen in the Park are private property, though the liverymen can on occasion imitate the aristocratic establishments so closely, footmen and all, that the inexperienced observer is unable to draw the line.

The late short revival of legitimate winter gave one important member of the community but imperfect comfort. That was the small boy. It indeed supplied him, when particularly favored as to locality, with a limited amount of coasting, and prevented snowballing from becoming altogether a lost art, but it brought no skating with it. The lakes at Central Park have at no time, up to present writing, been frozen sufficiently to serve his purpose. The sense of the injustice of the situation is unmistakably stamped upon his countenance, and the possession of skates, which were perhaps given to him last Christmas, he regards as a bitter mockery. It may be a comfort to him and to others to know that the theory that the character of the local winter has permanently changed is not indorsed by many scientific people. There have been series of mild winters before that were followed by those of the approved type, and their view is that history is simply repeating itself, the "grip" and various other things included.

EDWIN COWLES.

EDWIN COWLES, who died on the 4th, was one of those sturdy characters which thrive best under conditions of adversity and struggle. Like his associates who strove with him to abolish slavery and maintain the Union, he bequeathes to happier times a career full of inspiration and instruction to a generation which, without such examples, could scarcely appreciate either those times or the sort of men who lived in them. He was born September 18, 1825, in Austinburg, Ohio. His father was a doctor, and going further back, one of his ancestors was the first clergyman in Connecticut, while another was the first white child born in New England. Of mingled Huguenot and Puritan stock, he naturally prospered under influences which crush weak natures. He was a printer from necessity. While still a boy, and as early as 1853, he began his work as a member of the firm of Medill, Cowles, & Co., publishers of the *Forest City Democrat*. The same sheet, under the name of the *Leader*, will be his best monument. It was in the *Leader's* editorial rooms that was held the meeting of party managers which resulted in the consolidation of the Know Nothings, Whigs, and Free-soilers, and the holding at Pittsburgh of the first Republican Convention.

Although Mr. Cowles was the owner and manager of the *Leader*, he did not become its editor until after 1866, when a company was formed to take over a business too extensive for his individual tastes. His fervent abolitionism found vent after the battle of Bull Run in an article headed "Now is the Time to abolish Slavery," a sentiment which he maintained amid much clamor, although its support almost cost him the Postmastership, which he held from President Lincoln. Although he was equally early and strenuous in advocating those other reforms which are associated with the Republican party's early history, perhaps his most distinctive work as an editor was his opposition to Catholicism. He was foremost among the founders of the Order of the American Union, and in numerous addresses before it he depicted even more strongly than in the *Leader's* columns what he conceived to be the dangers of papal influence in American affairs.

Mr. Cowles was as sturdy in body as in mind and character. He had numerous physical encounters, from which he usually emerged victor, and invariably he enforced respect for his prowess. Once he beat a robber who attacked him, and once when an angry reader of the *Leader* threatened him with a revolver, he felled him with a single blow. Another characteristic was incapacity to hear certain sounds, just as some people cannot see certain colors. He could not hear the song of birds, nor the corresponding high notes in music, nor the aspirate in the human voice, whence resulted a certain defect in speech. His sense of humor was comically deficient. As an instance may be cited a perfectly serious rebuke to an unfortunate writer who had described an egg which, despite its size, was laid by a single hen. The delinquent in vain expostulated against the reproof. Every explanation that it was a joke, Mr. Cowles met with the retort that he wanted in the *Leader* no such funny things as a suggestion that two hens could lay a bigger egg than one hen.

Mr. Cowles leaves a widow, a married daughter (Mrs. C. W. Chase), and three sons—Eugene H., Alfred H., and Lewis H. It is most agreeable to add that though he fought so hard, he fought so honestly that the animosities of his earlier career scarcely survived into his later years, and above his grave there will be only unfeigned and unmingled respect and regard.

SOME NEW YORK CLUBS.*

(Continued from page 196, Supplement.)

be. For two years its monthly dinners have been among the events of the season. Many of the best known men of the country have sat at its board—not the guests of the club, for the club cannot entertain, but as guests of individual members. When this young organization learns that no club rule is good for anything that is not sometimes judiciously broken, it will attain a prosperity which has been reached by no other organization of its character outside of London.

The Authors' Club is a club with rooms, and not a house. It is charming when its meetings occur. There is a delightful freedom about it, but the sophistic guest cannot help wondering why so many good fellows should not join in a body some real club like the Fellowcraft. But they answer that there is a *raison d'être* for the Authors' Club which would, somehow or other, be lost on the way to the other club. It is an excellent answer, after its fashion; but there is, after all, only one *raison d'être* for any club, and that is the congeniality of its members; and at least this is true, that the Authors', the Players', the Fellowcraft, and the Salmagundi represent a distinct phase of life in the city. They are the expression of the social desires of men who are engaged in literary and artistic pursuits. It is not true, of course, that each member of a club should find a congenial companion in every other member, but it is true that the tone of the club should be harmonious; and in such an organization it is possible that personal dislikes and even enmities should exist. However, the Authors' Club is an institution with which New York should not dispense. It marks the fact that there are among us people who live partly by the making of books, and it is something to the credit of the New World's metropolis that, in the absence of an international copyright law, there are authors who can pay its huge rents. It is to be regretted that we cannot present a picture of the rooms of this club, but the permission to make one came too late for the purposes of this article.

Quite the latest addition to the clubs of New York is the Aldine, founded by publishers, and domiciled in one of the fine old-fashioned houses of Lafayette Place. Its object is the "encouragement of literature and art, and social intercourse and enjoyment." It presents the most beautiful artistic achievements both in its rooms and its club book. There are reasons why it should be the most noteworthy of all the clubs of its kind in the city.

The talk about the Century and its younger kin has led us far away from the clubs of which the Union and the New York are the prototypes. There is not, indeed, very much to say about them. What the fashionable clubs of London are, that these in New York strive to be. First after the Union, and an offshoot from it, is the Knickerbocker. It came into existence partly because the waiting list of the Union was too long for young men who were thirsting for the joys of club life, and partly because the real old New-Yorker, the man whose fashion dated back to Mrs. Cannon's haberdashery, resented the introduction into the Union of those whose fathers were born in Ohio, and whose names were not known in the days when that magnificent beau, Beverly Robinson, used to promenade Broadway as his descendants now promenade Fifth Avenue. So there are old men as well as young men in the handsome club-house on the corner of Fifth Avenue and Thirty-second Street, and the names of most of the members are more than one generation old in New York.

After the Knickerbocker comes the Calumet, founded in 1879, and known familiarly as the junior Union. Of the same character is the St. Nicholas, which was born in 1875, and whose membership is confined to persons descended from some one who was a resident of the State in 1785. In its charter it is announced that the club is formed for the purpose of collecting and preserving "information concerning the early history and settlement of the city and State of New York." Those who are not members of the club are not informed as to the wealth of its historic archives. It speaks of the pride of ancestry after the manner of the great society of that name—a society of real New-Yorkers, which is now only less important than that other famous organization, the New England Society, the New Englanders and not the Dutch having taken Holland.

These many organizations speak not only of the immense and rapidly increasing wealth of the city, but of its slightest social differences, for while the Union, Knickerbocker, Calumet, St. Nicholas, and New York overlap, there are variations in the pervasive influences which govern them. In the Union, one will be impressed with the wealth and comfort of the club; in the Knickerbocker, with the anxious cares of extreme fashion; in the Calumet, with the joys of youth; in the St. Nicholas, with all these, and with the further fact that New York has a past.

All these clubs are represented more or less in the University, which occupies the building on the corner of Madison Avenue and Twenty-sixth Street, once the home of the Union League. It has been in existence since 1865, and its abode was formerly on the corner of Fifth Avenue and Thirty-fifth Street, the house having been transformed into the New York Club's present building. The University is what its name denotes—a club of college men. It is big, splendid, luxurious. Its library is the most extensive of all club libraries in the country. Strangers who dine in what was once the theatre of Mr. Jerome's building—the generous rental of which is now the dower of Lady Randolph Churchill—are cautiously shown the army of handsome books through a half open door. Of all the clubs of the city, the University is that in whose list of members will be found the names of men who could be found in no other club—laborious professional men who are glad to know that there is a place in this vast business world where they can meet the boys whom they knew in college. It is a most interesting club this, its life is so like that of a university town, sometimes academic and sometimes full of bubbling excitement. More than that, its Burgundy is always at the proper temperature.

The University and the two great political clubs, the Union League and Manhattan, have social features which make them kin to the Union and its relatives, and the membership of all except the political clubs is in a measure interchangeable. There is many a man who belongs to all the clubs except that one to whose politics he is opposed. The Union League is the club which is most distinctly political. It was founded in 1863, and into its organization was infused the patriotic fervor of the war. Its purpose, according to its charter, is "to promote, encourage, and sustain by all proper means absolute and unqualified loyalty to the United States; to discountenance and rebuke by moral and social influence all disloyalty to said government, and every attempt against the integrity of the nation."

We all know what such sturdy English meant in the days when this charter was written. Its stately building on the corner of Fifth Avenue and Thirty-ninth Street is the club-house of some club-men and of many politicians. Unlike clubs such as the Union, it invites both men and women within its precincts to receptions and to art exhibitions. It has also a standing political committee, and holds great meetings for the purpose of swaying the current of events. It is very rich and very influential. But as the years have softened manners, many of its intense members have drifted away from the rigid tenets of the old political faith. There are mugwumps within the stronghold, concerning whom there have been sharp contentions ending generally by the strengthening of the liberal tendency. As the social instinct of the club grows, party bitterness must disappear.

Far down Fifth Avenue, on the corner of Fifteenth Street, is another political club—the Manhattan. It is usually called a Democratic club, and most of the Democratic leaders of the country are members of it, but so gentle is its politics that one might sit within its walls a month without discovering that it had any. It was founded in 1865, when the Democratic party was not popular, and its purpose was declared to be "to advance democratic principles." No one certainly could object to so mild-mannered a proposition. To be sure, the club gives some political receptions, but it would not reject a man for being of the opposite faith. Its just pride is in its *chef* and its cellar, and when it moves into the Stewart building its politics will pale even more before the growth of its popularity as a club pure and simple.

There are more clubs of this great city worthy of much philosophy, but a volume would scarce contain their names. At some other time we must consider those which have been omitted, not the purely political clubs or other organizations which exist solely for the advancement of a cause, but the out-of-the-way clubs, the great athletic organizations, the clubs of the Greek letter societies, the many country, hunt, and yacht clubs, and more important than all, the German clubs, which are institutions whose magnitude is little dreamed of by the ordinary American citizen, and which represent the development of a social phase transcending in the rapidity of its growth that of any other element of our many-sided metropolis. There are besides the American clubs spoken of, by which I mean clubs founded on the London principle, other similar organizations, new but representative, like the West Side Club, which is about building a handsome home for itself. But of all these it is impossible to speak. I have sought only to make some brief mention of certain social characteristics of the town, and to show how out of every homogeneous social set blossoms a club into which men who love their kind may sometimes escape the general rush and swirl of the human tide outside.

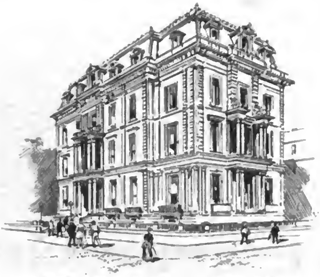
---

* An exterior view of the University Club building will appear in an early number of the WEEKLY. The Players' Club was illustrated in Nos. 1674 and 1730.

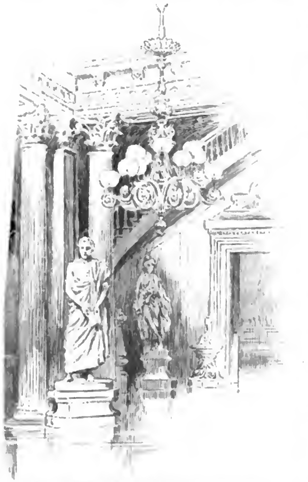
Google

.s described in the WEEKLY some time o, but it seems necessary to touch upon again in view of the important influence at the readjustment of rates in the North-est is exerting upon the market for railway curities. For the purposes of illustration e may say that the thoroughfares between ie East and the West, north of the Ohio .iver, consist of three converging lines, running from St. Louis, from Chicago, and from t. Paul to New York and its neighboring eaports, Boston and Philadelphia. The raiload companies themselves have been rather low in recognizing the advantage that each ne of these lines possesses over the others in elation to the through traffic that focuses at r is distributed from the great trade centres of the West. The sharpness of competition and the enforcement of the Inter State Commerce Law have made these lines stand out very distinctly upon the map of the practical and studious railroad manager, and it is gradually being admitted, though in many cases very reluctantly, that it is useless because unprofitable to try to divert from any one of these geographical lines to another the traffic that is nearest to it. Yet that is what the Chicago, Burlington, and Northern Railroad is trying to do, in the face of constant proof in its own earnings that the experiment is a failure.

It must be admitted that its nominal managers are compelled by the location of the road to pursue an aggressive policy, since it touches few important local points, and must depend almost entirely upon through business between St. Paul and Chicago for its support. Its competitors, and there are five of them, all have large local patronage; besides, the portion of each road that comes into direct competition with the Chicago, Burlington, and Northern is only a part of an enormous system stretching out in other directions, so that the reciprocal relations that exist between the Chicago and St. Paul line of each system and the rest of the system contribute to the support of the particular mileage under discussion. The Chicago, Burlington, and Northern should sustain similar relations to the Chicago, Burlington, and Quincy Railroad Company, which is responsible for its construction. It is difficult to determine exactly what are the traffic relations between the two concerns. They are, of course, covered by a contract, but that contract is not available for the public. The Inter State Commerce Law provides that all contracts of the character that must exist between these two roads must be filed with the Inter-State Commerce Commission. Efforts have been made by the stockholders of the Chicago, Burlington, and Quincy Company, and by others who are entitled to make the request, to obtain a copy, or at least a perusal, of the document, but without success. The Commission holds it as a sort of privileged communication. It may contain nothing remarkable, but the extraordinary privileges that the Chicago, Burlington, and Quincy Company persistently allows the smaller concern suggest that any document in which the working arrangement between the two is set forth must be of more than passing interest.



THE NEW HOME OF THE MANHATTAN CLUB.—[See Page 211.]



. OF THE NEW HOME OF THE MANHATTAN CLUB.—[See Page 211.]

The endeavor of the C., B., and Northern road, with the use of about ninety miles of the C., B., and Quincy track, which is required to complete its line into Chicago, is to divert from St. Paul and Minneapolis through traffic that would naturally go directly East from those points, and to secure traffic from the East by way of Chicago that would naturally go by a more direct route to the "Twin Cities." The C., B., and Northern loses money by the operation, and has been losing it ever since it has been engaged in the business. No one has yet been able to forecast what the outcome of these abnormal relations and destructive policy will be, probably for the reason that the motives back of both have never been satisfactorily fathomed. One thing is clear, however, that as long as both are maintained there can be no absolute harmony among the Granger Trunk Lines. Their revenues will be constantly threatened, and the possibility of a disastrous rate war will be always present. Indeed, it is said, relative to the readjustment in rates that has just taken place, that the competitors of the C., B., and Northern road who feel most keenly the reduction in rates between Chicago and St. Paul have forced a similar reduction between Chicago and Kansas City, with the view of retaliating upon the C., B., and Quincy, whose system lies principally between those two points, and which is held to be responsible for the existence and policy of the C., B., and Northern road.

The problem might be solved if pooling were permissible, for then the Chicago, Burlington, and Northern road could be allotted a share of the traffic that would be satisfactory to it if it would maintain rates; but pooling is prohibited by the Inter-State Law, hence the managers of all the roads interested feel hopeless in contending against this abnormal situation. In the circumstances the remedy must come from a readjustment of the relations between the two Burlington companies, and until that event takes place the Chicago, Burlington, and Quincy Company, which built and virtually owns the smaller road, must be held by investors and the public as entirely responsible for whatever damage and loss they may sustain by the maintenance of the present relations.

COLLAN ARMSTRONG.

THE BUCCANEERS OF OLD

Planted the skull and cross-bones, their ensign, defiantly at the masthead. Your modern pirate, not on the high seas, but upon the high reputation of standard remedies, skulks under various disguises. His hole-and-corner traffic has never to any degree affected Hostetter's Stomach Bitters, although that standard invigorant and corrective has long been the shining mark at which his shafts have been directed. Cheap local bitters, composed of fiery unrectified stimulants, with an infusion, or extract possibly, of some tonic bark, are still sometimes recommended as identical with, or similar to, or possessing virtues kindred to, those of America's chosen family medicine. These perish speedily, while the great subduer and preventive of diseases pursues its successful career, overcoming malaria, dyspepsia, nervousness, kidney troubles, constipation, and rheumatic ailments, not only on this, but on many continents.—[Adv.]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[Adv.]

PUBLIC SPEAKERS AND SINGERS

Can use "BROWN'S BRONCHIAL TROCHES" freely, without fear of injury, as they contain nothing injurious. They are invaluable for allaying the hoarseness and irritation incident to vocal exertion, effectually clearing and strengthening the voice. Ask for and obtain "BROWN'S BRONCHIAL TROCHES." 25c. a box.—[Adv.]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[Adv.]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures
Cramps, colic, colds; all pains. 25 cts. a bottle.—[Adv.]

As a refreshing table beverage Nicholson's Liquid Bread ranks high. It is pleasant to the taste, invigorating, and easily assimilates with the food. Try it. Your druggists or grocers keep it.—[Adv.]

BLAIR'S PILLS.—Great English Gout and Rheumatic Remedy. Sure, Prompt, and Effective. At druggists.—[Adv.]

LADIES take ANGOSTURA BITTERS generally when they feel low-spirited. It brightens them up.—[Adv.]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[Adv.]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[Adv.]

That tired, debilitated feeling, so peculiar to spring, indicates depraved blood. Now is the time to prove the beneficial effects of Ayer's Sarsaparilla. It cleanses the system, restores physical energy, and infuses new life and vigor into every fibre of the body.—[Adv.]

SENATORIAL SECRECY.

THE attempt of the Senate to deal with the revelation by the press of the proceedings of the secret sessions is ludicrous and futile. The only way effectually to prevent the publication of such secrets is to make publication a penal offence, and Congress will hardly try to do that. The clever newspaper man

to be an impeachment of his judgment, if not something worse. The country had certainly the right to know why the Senate thought unfit or unsuitable a man whom Washington upon his responsibility declared to be both fit and suitable. In the same way, when his successor announces that he thinks Warmoth to be both fit and suitable, the country justly requires to know what Senators agree with him. The secret session for confirming nominations ought to be abolished if for no other reason than that it is not and cannot be made secret.

TWO PICTURES.

Senator Hoar, one of the most upright of Republicans, recently described the present spirit and purpose of the Democratic party. The New York *Sun* about the same time, in illustration of the remark of Mr. Thomas C. Platt that "the Republican conscience is so tender that it sometimes fears to do what it knows to be right, because it fears unjust criticism," recalls the record of "so sensitive and shrinking" a party. Both descriptions are extraordinary pictures. But if both were accurate portraits, the country would be in a dismal plight.

Senator Hoar, premising that he deplores and would diminish the excesses of party spirit, but that the government must be carried on by party, remarks:

"The difference between the two parties that contend for the control of this country was never greater than now. It is a difference that goes to the profoundest depths of the Constitution, and to the very roots of the moral law itself. It is far beyond all questions of currency, of finance, or even of administrative reform. One party means that justice, equality, and freedom shall be the law of the land everywhere; that every citizen, whatever his color or condition, shall exercise his equal and honest share in the government, according to the Constitution, and according to his birthright as an American citizen. The other party means to seize upon the powers of this government whenever and wherever it can. It means that the white Democratic oligarchy, though a minority, shall seize upon and keep the political forces of the South, and that the Democracy of the North, though a minority, shall ally itself with that oligarchy to get possession of the forces of the national government. This purpose it scarcely deems it worth while to disguise. Behind the murders of Clayton and Saunders and Matthews, behind the rifles that escort the election boxes in Mississippi and the

class postmasters. The bill might be somewhat amended with advantage, but it is a well-considered scheme to establish the postal service upon its proper basis. The bill would relieve members of Congress of the annoyance of one of the most harassing forms of patronage, while securing to every community its own preference in the management of its post-office, and depriving the office of its quality of local party head-quarters. It would tend also to check the constant disturbance arising from a change of the postmaster and of the site of the office, and to maintain in every village the continuance of satisfactory service. Indeed a more simple, complete, and practical improvement in the postal service has not been proposed. The other measures hitherto suggested, such as election of postmasters or selection by political caucus, would increase instead of relieving the present trouble by stimulating party contention.

Mr. Lodge's bill provides that the Union shall be divided into suitable postal districts, each with a postal inspector, to be designated by the Postmaster-General. When a vacancy exists, the inspector shall give due notice, and furnish papers to be filled out by applicants, to furnish certain information required, and every applicant must also furnish a certificate under oath from three reputable citizens holding no national or State office, stating their knowledge of the character and fitness of the applicant, without any political remarks whatever, which, if made, shall vitiate the certificate. The list of applicants shall be conspicuously posted for the information of the community; and the inspector, upon personal inquiry and examination, shall grade the applicants in order of their fitness as thus ascertained, and designate those whom he considers eligible, with his reasons; the Postmaster-General shall then appoint one of the candidates thus certified, and shall record his reasons in case he does not select the name graded highest. The appointment shall not be made nor recommended by the inspector for political reasons. This is all good, but the exclusion of national and State office-holders from signing the certificate should be made more definite by an express prohibition of solicitation from members of Congress.

As we have already pointed out, this scheme restores the appointment to the executive branch

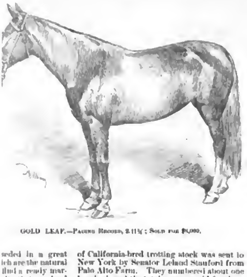
twenty years ago, but breeders find that their young stock, especially if untried, can be disposed of to better advantage when placed in public competition, and advertised in the same way as other marketable commodities. These auction sales of fashionable trotting stock are held in various parts of the republic, principally during the winter months, when the attention of prospective buyers is not diverted by speed contests as it would be in the racing season.

In Kentucky, where there are probably more stock farms than in any other State, these sales are generally held during the first and last months of the year, Lexington being the central point for such events. It was here that the California bred colt Bell Boy was sold for $51,000, the highest price ever paid for a trotting horse at auction. These sales are conducted by men who make it their special business to collect choice animals, and place their merits of breeding and appearance in the most attractive and readable form, by means of elaborate catalogues and through the medium of the turf journals.

New York city also possesses peculiar advantages for the disposal of the products of the great breeding farms, so much so that it has been profitable to bring stock from far-off California and sell to the bidders that come to the metropolis. There have been large public sales of thorough-breds in New York, but for the past four years the trotters have realized prices far beyond what the best running bred horses have ever reached, and every winter sees the average increase. The firm of P. C. Kellogg & Co., established about twelve years ago, have managed the majority of these large sales, and their success in this venture has come to be quite remarkable. At first the consignments sent to them came from Eastern farms, including such famous establishments as Stony Ford, in this State, and Highlawn Farm, in Massachusetts. Kellogg & Co. originated the plan of inducing breeders to unite in placing their stock in the auction market at what are now familiarly known as "Combination Sales"; and these have become annual fixtures, attended by horsemen from all parts of the land. Of the colts disposed of in this way, the one that afterward achieved the greatest fame on the race-track is the black gelding Guy, who was bought for a small sum, and taken to Cleveland, where he afterward became the property of W. J. Gordon, for a price well up in the thousands. At one time Guy showed speed that promised to place him at the head of the trotting records; his mile in 2.10¾, made at Cleveland last year, is within two seconds of the best mile made by Maud S.; and as he is still comparatively young, it is possible he may yet reduce his present record. Of the developed horses sold by Kellogg & Co., the stallion Smuggler, whose record of 2.15¼ stood as the best among trotting sires for some time, is the most noted, though he had fallen into obscurity when placed under the hammer in 1888, and was secured by his present owner for less than one thousand dollars.



GOLD LEAF.—Pacing Record, 2.11¼; Sold for $9,000.

It was just four years ago that the first lot of California-bred trotting stock was sent to New York by Senator Leland Stanford from Palo Alto Farm. They numbered about one hundred, and the total amount paid for them was $86,000, which was the highest average for the produce of one farm up to that time. Last year another consignment was sent across the continent from the same establishment, and several other California breeders followed Mr Stanford's example. This year the overture has been repeated during the present month, and the results so far have exceeded anything ever known at a public sale of horses. During the fifth and sixth days of March the entire stud of the Rosemeade Farm at Los Angeles was disposed of, when eighty-seven animals, most of them quite young, fetched $235,995 in all, an average of a little more than $2700 each—by far the largest rate ever paid for any kind of horse-flesh where as many were offered in one lot. The top price was $25,900, paid for the stallion Alcazar, whose record of 2.20½ is not particularly fast in this era of sensational speed, the principal reason that he is deemed so valuable being that his dam, Minnehaha, is the greatest of living broodmares, having produced fine foals that afterward obtained records below 2.30, while one of them, Beautiful Bells, is the dam of four fast animals, two of them with records below 2.30 at three years, including the noted Bell Boy, lately destroyed by fire in Kentucky. Alcazar's sire, Sultan, also got the fast horse Stamboul, who trotted in 2.12½ last fall, and is thought equal to greater feats this year. Voodoo, a two-year-old colt by Stamboul, out of Eva, a daughter of Minnehaha, was sold the same day with Alcazar, the bidding on him going to $24,100, just $1200 less than was paid for Mascot, another colt bred at Rosemeade, and sold in New York last spring for the longest price realized by a two-year-old, and the highest ever paid for a trotter at auction in New York. Following the closing out of the Rosemeade stud were two consignments from other California farms, when the figures dropped a little, but were still quite large. Those from Pleasanton Stock Farm, where the stallion Director, record 2.17, is kept, brought on an average nearly $2100, one of them, the pacing mare Gold Leaf, leading the list at $9000. Gold Leaf has a record of 2.11¼, made during 1889 in her four-year-old form, reducing that of 2.15, made at three years. Alcazar is destined for a large farm in Wisconsin owned by Uhlein Brothers; Voodoo goes to the Babcock farm at Hornellsville, New York; and Gold Leaf is now owned by J. H. Shults, a Brooklyn millionaire, who has an extensive breeding establishment at Parkville, Long Island.

A scene at one of these large sales in the metropolis, most of which are held in the American Institute Building, on Third Avenue near Sixty-fourth Street, shows an assemblage of the principal breeders, owners, trainers, and patrons of the trotting horse from all sections of the country. During the bidding on each animal it is exhibited in a ring about an eighth of a mile in circumference, constructed outside of the enclosure for spectators, and covered with loose dirt. If the horse is well broken to harness, a two-wheeled road cart is often used, and quite a high rate of speed can be safely attempted by a competent driver. More frequently, however, an attendant, mounted on a well-trained mustang, drives the trotter alongside with a pair of reins, when the gait and speed are better seen than by any other method. Frequently, when the bidding lags, the groom is ordered to start off again with the animal in competition, and a quick dash about the ring often results in a considerable addition to the sum offered before the exhibition.

There are several other important sales at the American Institute Building this month under the management of Kellogg & Co., including stock from Stony Ford Farm, in this State; Bates Farm, near Boston; consignments from A. B. Darling, of New York, and other large breeders; while Senator Stanford sends over one hundred animals from his famous nursery at Palo Alto. Many of the last-named are the get of Electioneer, the most successful sire of trotters now living, so that the California offerings will probably continue to rule the market as heretofore.

Charles Arnold McCully.

THE PAN-AMERICAN CONGRESS.

The historical precursor of the International Conference of American republics at Washington was the Panama Congress, which assembled June 22, 1826. Called at the suggestion of Bolivar in 1822, it was looked forward to with the greatest enthusiasm; yet it really accomplished nothing. Only Colombia, Central America, Peru, and Mexico were represented in it; Chili being at the time in the midst of a civil war, the Argentine Republic having refused co-operation, and the delegate from the United States not arriving until the congress had adjourned to meet in Mexico.

For many years it has been the desire of several American statesmen—notably Mr. Blaine—to gather all the states of this hemisphere in another congress for discussion of matters interesting all alike. At least for ten years has the project been actively urged. Mr. Blaine gave much attention to it when Secretary of State in 1881. The South American Commission of 1884–5 were instructed by Secretary Frelinghuysen to get the judgment of the countries they were to visit on the advisability of calling such a congress. Finally, the so-called McCreary bill, approved May 24, 1888, empowered and authorized the President to call the conference some time in the year 1889. Every one knows how President Cleveland, after the election of 1888, determined to leave the whole matter to his successor, and how under the present administration the congress began, and have now almost completed its labors.

It cannot be denied that the undertaking was attended with inevitable difficulties. The lack of a common language, differences in parliamentary and legislative practice, and some old jealousies and suspicions of an international character, made the beginnings of the congress slow and hesitating. Yet time has obviated all these hinderances to the success of the gathering in a great degree; and, on the other hand, the power of republican affinities, and the better understanding gained in the course of discussion, have brought the various delegations into a state of general harmony and amicable agreement to disagree in those cases where they must. Naturally the main work has been done in committee, each of the topics mentioned in the call being assigned to a separate committee to prepare a report. These reports have nearly all been presented and approved, and there is every indication that the congress will be able to adjourn not far from April 1st.

Section 2 of the bill authorizing the President to invite the several governments to the conference set forth the subjects to be considered. That section has been the programme followed in the deliberations of the congress. It reads as follows:

"Section 2. That in forwarding the invitations to the said governments the President of the United States shall set forth that the conference is called to consider,

"1st. Measures that shall tend to preserve the peace and promote the prosperity of the several American states.

"2d. Measures toward the formation of an American customs union, under which the trade of the American nations with each other shall, so far as possible and profitable, be promoted.

"3d. The establishment of regular and frequent communication between the ports of the several American states and the ports of each other.

"4th. The establishment of a uniform system of customs regulations in each of the independent American states to govern the mode of importation and exportation of merchandise and port dues and charges, a uniform method of determining the classification and valuation of such merchandise in the ports of each country, and a uniform system of invoices, and the subject of the sanitation of ships and quarantine.

"5th. The adoption of a uniform system of weights and measures, and laws to protect the patent rights, copyrights, and trade-marks of citizens of either country in the other, and for the extradition of criminals.

"6th. The adoption of a common silver coin, to be issued by each government, the same to be legal tender in all commercial transactions between the citizens of all of the American states.

"7th. An agreement upon and recommendation for adoption to their respective governments of a definite plan of arbitration of all questions, disputes, and differences that may now or hereafter exist between them, to the end that all difficulties and disputes between such nations may be peaceably settled and wars prevented.

"8th. And to consider such other subjects relating to the welfare of the several states represented as may be presented by any of said states which are hereby invited to participate in said conference."

Taking up the reports of the committees, in the order of the topics thus mentioned, it appears that the proposal for a customs union has amounted to nothing, there seeming to be no way of overcoming the immense difficulties of any such scheme. It is recommended instead that separate reciprocity treaties be negotiated as feasible. The subject of communication by water has received most careful consideration. In general, it is recommended that steam-ship lines be subsidized by the several countries interested, in proportion to population. Yet as the congress has no positive legislative powers, and can only refer its recommendations to the several legislatures of the different countries, it is clear that it will be long before subsidies are paid under any such plan. The scheme is also complicated with questions about the flag to be carried by such jointly subsidized steamers, and about ownership, registration, and liability to be seized as cruisers in case of war. Not without much subsequent diplomatic negotiation can it be put into effective operation.

The plan for an international railroad, uniting all the countries of the hemisphere has been endorsed so far as to provide for a corps of engineers to make the necessary preliminary surveys for routes and estimate of cost. It will, of course, be long before anything more can be done. As one of the South American delegates has expressed it, "This is an affair for our children, not for us."

No committee has had a more important subject under discussion than the one charged with the consideration of a report on the simplification of customs regulations. It is recommended that the consular certification of a ship's manifest be no longer required, that a list of the proper terms to be used in invoicing goods be officially published, and that the participation of customs officials in fines and penalties which they may be called upon to fix be abolished. Several other recommendations looking to uniformity and simplicity make this report one of great practical value.

As to uniform weights and measures, the metric system has been recommended in all international transactions. In the important matters of international copyright and laws to protect trade-marks, the foregoing work of the Montevideo Congress of 1888-9 is suggested as a broad and feasible basis for further agreement. The treaties recommended by that body are fully reciprocal and satisfactory. On the general principles of extradition all are agreed, and the only question remaining is as to precise definition of extraditable offences.

The proposed common silver coinage has proved to be a question of great delicacy and difficulty. Little can be done in all probability beyond the recommendation of a common unit of coinage, which will make the various currencies interchangeable. This leaves out the matters of a specific international silver coin and of mutual governmental guarantees of weight and fineness. If the establishment of banks is realized, in accordance with the hopes of the committee on banking, it may put a new face on the subject of a common coinage before many years.

No measure before the congress has awakened more interest than the proposal to agree on a plan of arbitration to settle all disputes arising between nations, and so do away with war on this hemisphere. It may safely be said that every nation represented in the conference is in favor of arbitration, has used it in the past, and is ready to resort to it in the future. Yet there has been some difficulty in agreeing upon the terms of a measure to make arbitration universal and obligatory, without compromising the sovereign rights of the republics entering into the compact. But there is every likelihood that a substantial agreement will be reached, practically securing the benefits desired. It has been generally felt that the most important issue of the congress would be found in its dealing with this question, and that it could present no more impressive sight to the world than a solemn covenant between all the American republics to refer all international differences to a court of arbitration.

In general the congress has not fulfilled the enthusiastic hopes of some, but it has disappointed the ominous fears of others. The direct and immediate effects of its work cannot be very great in the nature of the case. But indirectly and remotely it is sure to have an influence of the highest importance. As a means of leading to international good understanding, of securing an independent and peaceful development for each country of the hemisphere, and of presenting to the world a striking spectacle of the material and moral power of the republican idea in this age, it must be declared to have achieved a good degree of success.

In publishing the portraits of a few of the foreign delegates to the International Congress at Washington, no invidious distinction is intended. Some of the representatives from abroad—Minister Romero, for example—are so well known in this country, both by name and face, that there is no reason for giving information about them. Our selection of names depends partly upon accessibility of biographical material in the cases singled out, and partly upon the fact that, for one cause or another, the delegates in question have assumed considerable prominence in the debates of the Congress. There is no doubt that others of the foreign representatives are as able as the men we name, and have made their influence felt in the congress.

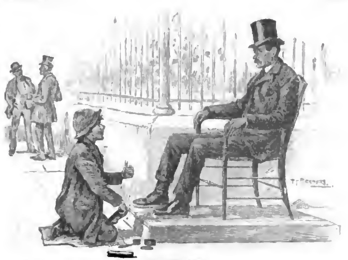
Beginning with a delegate from a country not far distant from us, the Republic of Colombia, in Cárlos Martinez Silva, LL.D., we have a man whose physical distinction alone would call attention to him among the whole body of foreigners. Tall and of massive frame, he towers above most of the other delegates like Saul above the rest of the people. He comes of excellent Colombian stock, as his father, who has recently died, was one of his country's most distinguished men, having been an able lawyer and President of the Supreme Court. The son has also held many posts of public importance and service. He has been a member of the Colombian Congress, has served as Minister of Public Instruction, and was Secretary of the Treasury at the time of his appointment as delegate to the International Conference. As a teacher and author he has likewise attained eminence. He has been President of the College of El Rosario, and has published several volumes. Among the last may be mentioned his *Treatise on Judicial Proofs*, his *Compendium of Ancient History*, and a *Compendium of Geography*. An edition of Bello's *International Law*, recently published in Madrid, contains an appendix of "Notes and Commentaries" from the pen of Dr. Silva. He was the founder, and for some time the editor, of *El Repertorio Colombiano*, a literary and political review of high class. Dr. Silva's abilities and special training fit him admirably for the work of the Pan-American Congress, and his prominence in its proceedings is but natural.

Passing on down the west coast of South America, we find Ecuador sending a distinguished son to Washington in the person of José María Plácido Caamaño. Born in Guayaquil, the principal city and seaport of the country, October 5, 1838, he comes of an excellent family. Trained to the profession of the law, he is a man of wide studies, as may be inferred from the fact that he is also a graduate in theology, having received the degree of Doctor in Theology. He is a large land-owner, and has gradually accumulated a fortune through agriculture. He has been Mayor of Guayaquil, Member of Congress, Chief of the Customs Service, and Judge of Letters. In 1882 General Ventimilla made himself Dictator of Ecuador, and Señor Caamaño was one of his strongest opponents. He was exiled in consequence, going to Peru. There he raised and commanded an insurgent force at his own expense, with which he invaded Ecuador with the intention of deposing the Dictator. Starting with only about five hundred men, a large proportion of whom were his own peons, he went on, step by step, until, after uniting his force with that of other patriot commanders, he captured Guayaquil, where the Dictator had more than five thousand troops. Señor Caamaño was chosen President *ad interim* after the fall of Ventimilla, and was subsequently elected President for a full term. Under his administration Ecuador progressed very rapidly; telegraphs and railroads were largely added to the resources of the country, and a great impetus was given to the cause of public education, many schools and colleges having been established under his direction. On February 6, 1886, a desperate attempt was made to assassinate President Caamaño. While in the railroad station at Tagusehi, attended only by two aides, he was set upon by sixteen conspirators. One of the aides was killed, the President slew one of his assailants with his own hand, broke through their ranks, flung himself into the river, and escaped by swimming about two miles. At the expiration of his term of office he became Governor of the Province of Guayaquil, a post which he still holds, being away on leave of absence. Ex-President Caamaño is a member of several scientific bodies of Spain, France, and Holland, and wears the ribbons of various foreign orders.

A Chilian delegate of distinction is Judge José Alfonso. Trained to the law, and beginning its practice in 1856, he was appointed on the bench of the Court of Commerce temporarily in 1862, and soon after was made a permanent judge of that important court. That position he held for eighteen years, and in the course of that time rendered the great service of compiling the vast body of legal decisions and mercantile usages into a Code of Commerce since adopted by the Chilian Congress for the whole country. His various publications and commentaries on this Code, and his long administration of the court taking cognizance of cases arising under it, make him undoubtedly the first authority in Chili on the subject of commercial law. In 1879 he was appointed Judge-Advocate of the Army of the North. Resigning this position on the ground of ill health, he was shortly afterward elevated to the bench of the Court of Appeals. Latterly he has been filling a temporary vacancy in the Supreme Court, and is in the direct line of permanent promotion to that highest tribunal of Chili. Judge Alfonso has also held several political offices. In 1875, at the special request of the President, he withdrew from the bench for a time to fill the position of Minister for Foreign Affairs in the cabinet. He was also Secretary of the Treasury for some months in 1880. He has been a leader in the cause of public education, and has accomplished a great deal in the spread of free schools. Personally he is a most amiable and agreeable gentleman.

Two of the Argentine delegates will next claim attention. Dr Roque Saenz Peña is a lawyer who has stuck pretty closely to his profession, though his public service, for so comparatively young a man (he is but thirty-eight), has not been insignificant. In 1876 he was elected to the Legislature of the Province of Buenos Ayres, and chosen President of that body. In 1880 he was appointed to the head of the National Registry of Property. Continuing in that position till 1887, he was then nominated Minister to Uruguay. He still occupies that office, being now in this country in attendance upon the Pan-American Congress on leave of absence. Probably one reason of his appointment as delegate was the fact that he had just been serving as an Argentine representative in the late International South American Congress at Montevideo. In the deliberations of that gathering he took a prominent part, being Chairman of the Committee on Criminal Law, and bringing in an elaborate and learned report. Dr. Peña has also done a good deal of journalistic work in Buenos Ayres.

His colleague, Dr Manuel Quintana, is considered the leader of the Argentine bar, and has taken perhaps the most conspicuous part in the debates at Washington. He is a man whose prompt energy, shrewdness, and ample knowledge would make him a marked personality in any assemblage. Something over sixty years of age, he has devoted the last thirty years almost exclusively to his profession, having steadily declined cabinet positions and other political appointments. Still, he has managed to render considerable public service, as the following list of the positions he has held will show: Professor of Civil Law in the University of Buenos Ayres; delegate to the Constitutional Convention of the Province of Buenos Ayres; Representative in the Buenos Ayres Legislature; member of the National Congress for four terms, and President of the same for two; Senator from the Province of Buenos Ayres; President *pro tempore* of the national Senate, and acting President of the republic during a temporary failure in the succession; President of the Convention for the reform of the Constitution; special Minister to Paraguay to settle questions of commerce and boundaries; Professor of Social Science in the University of Buenos Ayres, and Rector of the University; delegate to the International South American Congress at Montevideo.



A FEARFUL RISK.

"Yessir! Onny about an hour ago an old gent was a-comin' acrost de street when a horse and wagin came a-runnin' roun de corner, knocked 'im down an' broke bofe ees legs, just as he was comin' here to have ees boots blacked!"

Salvador de Menezes e Vasconcellos Drummond Furtado de Mendonça, who signs only Salvador de Mendonça, was born July 21, 1841, in the Province of Rio de Janeiro, Brazil. He comes from one of the oldest Portuguese families residing in Brazil, and is descended from the Drummonds of Scotland, the Hurtados de Mendoza of Spain, and the Menezes e Vasconcellos of Portugal. Senhor Mendonça was educated in Rio de Janeiro, and graduated in law at the Law College of St. Paul, Brazil. At the age of twenty-four he was Professor of History in the college of Pedro II. at Rio de Janeiro. Besides the Portuguese language and the classics he is familiar with Spanish, Italian, French, and English.

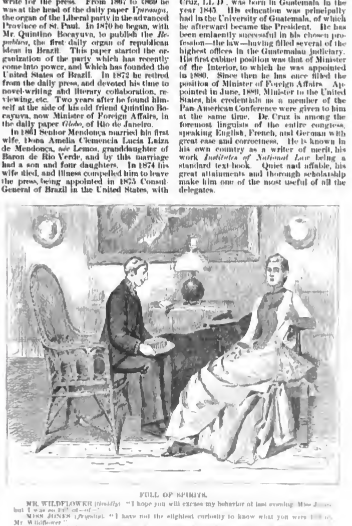
At the age of twenty, in 1861, he began to write for the press. From 1867 to 1869 he was at the head of the daily paper *Ypiranga*, the organ of the Liberal party in the advanced Province of St. Paul. In 1870 he began, with Mr. Quintino Bocayuva, to publish the *Republica*, the first daily organ of republican ideas in Brazil. This paper started the organization of the party which has recently come into power, and which has founded the United States of Brazil. In 1872 he retired from the daily press, and devoted his time to novel-writing and literary collaboration, reviewing, etc. Two years after he found himself at the side of his old friend Quintino Bocayuva, now Minister of Foreign Affairs, in the daily paper *Globo*, of Rio de Janeiro.

In 1861 Senhor Mendonça married his first wife, Dona Amelia Clemencia Lucia Laiza de Mendonça, *née* Lemos, granddaughter of Baron de Rio Verde, and by this marriage had a son and four daughters. In 1874 his wife died, and illness compelled him to leave the press, being appointed in 1875 Consul-General of Brazil in the United States, with head-quarters in New York. The parting words of the ex-Emperor to Senhor Mendonça in 1875 have been already published: "I hope that you will serve the empire in the republic as well as you have served the republic in the empire."

In 1876 Senhor Mendonça married his second wife, Miss Maria Elisa Varney Redman, from the State of Maine. After serving as Consul-General for fourteen years, during which period he was instrumental in the development of commercial relations between the two countries, and in establishing better mail facilities with Brazil, he was appointed last July Envoy Extraordinary and Minister Plenipotentiary of Brazil at Washington, on a special mission, and delegate to the International American Conference.

Three days after the fall of the Emperor, who knew always the republican ideas of his Consul-General, and had perfect confidence in his loyalty to the service of his country, Senhor Mendonça received notice from his old friend Bocayuva that his powers had been renewed by the provisional government.

The delegate from Guatemala, Fernando Cruz, LL.D., was born in Guatemala in the year 1845. His education was principally had in the University of Guatemala, of which he afterward became the President. He has been eminently successful in his chosen profession—the law—having filled several of the highest offices in the Guatemalan judiciary. His first cabinet position was that of Minister of the Interior, to which he was appointed in 1880. Since then he has once filled the position of Minister of Foreign Affairs. Appointed in June, 1889, Minister to the United States, his credentials as a member of the Pan-American Conference were given to him at the same time. Dr. Cruz is among the foremost linguists of the entire congress, speaking English, French, and German with great ease and correctness. He is known in his own country as a writer of merit, his work *Institutes of National Law* being a standard text-book. Quiet and affable, his great attainments and thorough scholarship make him one of the most useful of all the delegates.



FULL OF SPIRITS.

MR. WILDFLOWER (*timidly*). "I hope you will excuse my behavior of last evening, Miss Jones, but I was so full of—of—"

MISS JONES (*frigidly*). "I have not the slightest curiosity to know what you were full of, Mr. Wildflower."

MR. WILDFLOWER (*desperately*). "But you misunderstand me. It was not alcohol I was full of, but spirits."

MISS JONES (*contemptuously*). "Spirits! pooh! another name for the same thing, sir."

as it ever did under the fine laces of cavaliers or ruffled dames.

Since the days of local reporting few men have travelled so far and seen so much as Smedley. In 1880 and '81 he made exhaustive sketching tours in Canada, gathering material to illustrate a large work called *Picturesque Canada*. This trip marks the starting point in a steady rise in public fame as well as professional merit; and when, in 1885, Mr. Frederick B Schell, the present manager of Harper's Art Department, was requested to suggest the most competent artist to assist him in his labors upon the monumental *Picturesque Atlas of Australasia*, Smedley was immediately called for this work, in which he was engaged nearly a year. They utilized the opportunity of making the complete tour of the world. Smedley remained two or three years in Paris, and since then has been known to the public chiefly through the publications of the Harpers. Although to-day we can think of few that equal him in his particular field, it is not too much to expect that an artist who does well with so few years behind him will give

ence of exceptional capacities when he
n the ripe period of his powers.

POULTNEY BIGELOW

A COSTLY EXPERIENCE.

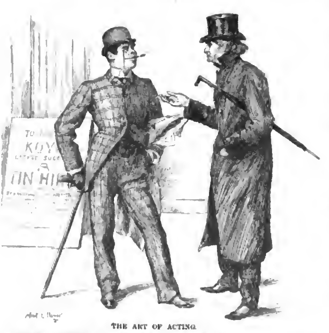
HE "Problem in Railroading" that was
ussed in this column a few days ago was
ed simultaneously with the publication
e last number of the WEEKLY. The so-
n was the one indicated in that number,
ely, a readjustment of the relations be-
n the Chicago, Burlington, and North-
and the Chicago, Burlington, and Quin-
ailroad companies. That readjustment
ists of a transfer of the ownership of the
to the last named company. The Chicago,
ington, and Northern road was built for
urpose of selling it to the Burlington and
cy company, and with the view of secur-
the prospective purchaser the promoters
e enterprise, themselves directors of the
ington and Quincy company, inveigled
corporation into taking one-third of the
k, to represent a part of its investment in
300 miles of road connecting the Bur-
on and Quincy's main line with St. Paul.
promoters of this disgraceful undertaking
been a long time carrying out their pro-
ame. Though they were able to commit
Burlington and Quincy company to the
rprise and to secure valuable traffic con-
ons from it, they have never been able
rsuade that company to pay the price at
h they have held a majority of the stock.
n the view of beating the parent com-
into a bad bargain they have ignored
ral laws and geographical conditions,
violated the soundest principles of rail-
management, as well as those of business
dity

A certain amount of satisfaction may be derived from the fact that those who built the C., B., and Northern road have been unable to exact the price that they hoped to for their stock. They used to quote their shares as high as $97 in the Boston market. That was three years ago. Since then the manipulation has steadily weakened, until the stock was quoted at $34 a share a few days before the directors sold their holdings to the Burlington and Quincy company at $40 a share. The stock is said to have cost them originally $18 a share. It is safe to estimate that the purchaser has saved about fifty dollars a share on about sixty thousand shares of stock, or a total of $3,000,000, by holding off for nearly three years; but by allowing the C., B., and Northern to make rates for a territory including Wisconsin, Minnesota, Iowa, Dakota, Nebraska, and to an extent in Illinois, Missouri, and Kansas, it has been chiefly responsible for one of the most disastrous rate wars that was ever waged. The effect upon its own finances can be demonstrated almost to a dollar. The net earnings of the Burlington and Quincy system in 1886 were over twelve million dollars. In the following year the Northern road was let loose to demonstrate its actual earning capacity. It reduced rates to divert over its line through traffic which would naturally have sought other channels. The effect of the reductions that it precipitated is shown by a decrease in the net earnings of the Burlington and Quincy company from 1886 to 1888 of over seven million dollars. In that two years the Burlington and Quincy company from paying all its charges, eight per cent. upon its stock, and carrying forward a million dollars to its renewal fund, was reduced to the necessity of drawing upon the surplus earnings of previous years to meet its interest and sinking fund charges. During the year 1889 a certain amount of restraint was imposed upon the C., B., and Northern road through the operation of the Inter-State Commerce Railway Association, and in consequence the railroads affected by its competition obtained better prices for their services. Through all this period the operations of the C., B., and Northern road have been continuously unprofitable, and it is understood that the question of supplying the money required to pay the interest due April 1 upon its first mortgage bonds was an important factor in determining the directors to close out their interest in the concern.

The purchase will cost the Burlington and Quincy company about $2,500,000, and to save an equal amount it has lost fully $10,000,000 in net earnings, and helped to bring about permanently lower rates throughout the Northwest. All the railroads of that section of the country have suffered various degrees of financial prostration, and the markets for railway securities have received a shock from which they have as yet hardly begun to recover. The central figure in this transaction, the costly effects of which have been barely outlined above, is Mr. John M. Forbes, a resident of Boston, and Chairman of the Board of Directors of the Chicago, Burlington, and Quincy Railroad Company. He and members of his family and a few social and business associates are, according to the records, responsible for the building of the C., B., and Northern road, and for its prejudicial relations with the Burlington and Quincy company. Yet throughout the transaction Mr Forbes and those directors of the Burlington and Quincy company who at the same time have served in a similar capacity in the C., B., and Northern company appear to have retained the confidence of the shareholders of the first-named corporation.

As the result that has taken place was inevitable, there is a unanimity of opinion on the part of those who are best qualified to judge of the merits of the transaction as to its wisdom and the benefits that are almost certain to be derived from it. The effort to demonstrate that in railroading two sides of a triangle are equal to the third side has been abandoned, and with that event the evils incidental to the effort should and will disappear. There are other questions to be solved before the railroad business of the country can be established on the best possible basis, but none of them is as serious as the one that has just been disposed of by the Burlington and Quincy company. It is unnecessary to attempt to foreshadow the details of the policy of the Burlington and Quincy company in its management of its new acquisition. It is enough to know that it has become the principal if not the sole owner of the most disturbing piece of railroad that was ever built, and that it has taken that step with the view of protecting itself and its neighbors, and promoting more harmonious relations between all of them, and hence more profitable rates for all.

COLLIN ARMSTRONG.



THE ART OF ACTING

JAMES. "Hullo, De Forest. How's the world usin' ye, me boy?"
DE FOREST. "Now is the winter of our discontent. Bad, bad, Jimmy. I'm playing Buckingham in the Blizzard at fifteen a week. But, anon, what cheer with you?"
JAMES. "Hippopotamus in the Tin Hippopotamus at two hundred. Come and dine with me."

WE'LL SUPPOSE A CASE.

You are nervous and dyspeptic, your appetite flags, your slumber is broken or disturbed by uneasy dreams, or you court the sleepy god in vain. What shall you do? Try an alcoholic excitant to stimulate appetite? Deaden the nerves at bed-time with a narcotic? Neither of them. Try Hostetter's Stomach Bitters. It will, believe us, be more than a trial. You will continue to use this justly renowned nerve invigorant and stomachic. It is in the exigency supposed just what is wanted. It is a healthful stimulus to appetite and digestion, does not excite, but quiets the brain and nerves, is an excellent diuretic, and a speedy reformer of a disordered condition of the liver and bowels. It counteracts a tendency to rheumatism, nullifies the prostrating effects of overwork, mitigates the infirmities of age, and hastens convalescence. Persons exposed to rough weather should use it as a preventive, as should also tired students and business men.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

A SUDDEN CHANGE OF WEATHER
Will often bring on a cough. The irritation which induces coughing is quickly subdued by BROWN'S BRONCHIAL TROCHES, a simple and effective cure for all throat troubles. Price, 25 cents per box.—[*Adv.*]

IMPERIAL GRANUM
Is the safest, most reliable, and wholesome FOOD for Infants and Children. The most nourishing, strengthening, and delicious FOOD for Nursing Mothers, Invalids, Convalescents, and the Aged.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

ASK your physician as to the merits of Nicholson's Liquid Bread or Pure Malt Extract as a tonic for building up the debilitated system. Physicians recommend it. Druggists and grocers keep it.—[*Adv.*]

LADIES never have any dyspepsia after a wine-glass of ANGOSTURA BITTERS. Sold everywhere.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

THE Best Worm Lozenges for Children are Brown's Vermifuge Comfits, 25c. a box.—[*Adv.*]

WHEN Macbeth ironically asked, "Canst thou minister to a mind diseased?" he little knew that mankind would one day be blessed with Ayer's Sarsaparilla. In purifying the blood, this powerful alterative gives tone and strength to *every* function and faculty of the system.—[*Adv.*]

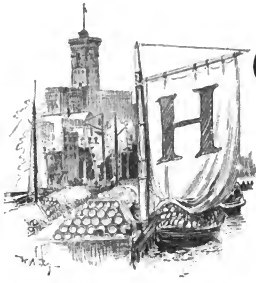
HARPER & BROTHERS, NEW YORK.



HOW A GREAT CITY IS FED.

BY G. T. FERRIS.

ILLUSTRATED BY W. A. ROGERS.

THE purely physical needs of man are at the bottom of nine-tenths of human work. They not only inspire the industry but furnish the occupations. To obtain food and raiment, and to secure shelter from the weather, measure the hopes and ambitions of a very large majority of the race. To secure the wherewithal to live and to propagate his kind sum up the history of the average man, as it does that of the ephemera which flash across the radiance of a June morning. "Eat, drink, and be merry, for to-morrow you die," is about the whole message which science sends to humanity, when we have shrunk all its intellectualism and grandeur down to the ultimate base on which it stands.

The rich man in his palace represents but the expanded needs of the cave-man who fought with bears for the possession of a den, and carved on the walls pictures of his grapples with beasts not a whit more savage than himself. But in this enormous expansion of needs is contained the epic of civilization. Men have labored, combined, thought, fought, and intrigued for many thousand years, with the net gain of forming an ideal in stately houses of carved wood and stone instead of caves and huts; in silks and satins, broadcloth and velvet, instead of skins and fig-leaves; in the delicious sophistries of a French cuisine instead of a reeking collop hot from the victim; in Champagne and Burgundy instead of water or goat's milk. This evolution of desire flowered out of a foul root with its parallel achievement, plus the mental discipline gained in the struggle, will account for most of the wonders of social growth. It gives reason for being to the farmer, the fisherman, the mechanic, the manufacturer, and the merchant, with the various minor crafts and occupations which ramify from each one of these callings. Of these the lines of effort devoted to the growing and distribution of food are by far the most important. Clothing and shelter in many parts of the world are superfluities, or at most not more than luxury. The acquirement of the wherewithal to fill the stomach—by fraud, force, tilling the soil, or honest barter—is indispensable. The civilized man only adds to the brute needs of the wild man that superior sense of the tickling of the palate grown out of the habit of experiment and the search for the unknown.

The span from truffled turkey and green turtle soup to roots and raw fish is easily taken in fancy, yet what vast proportions it covers! At the height of Greek and Roman civilization it was only the enormously rich man who could command the food resources of a territory more than a few hundred miles away, and that only in the one class of the cereals. Now the greasy mechanic or the ditch digger gathers tribute from the whole world to supply his table; and what Lucullus could hardly compass by spending 50,000 *denarii* for a single supper any one may now have at the price of a day's wages.

When one stops to think how a great city like New York is fed, what a multiplicity of forces, what complexity of effort, what a cost of energy and forethought it involves, the mental view is almost bewildering. Could the juice of some magic herb, potent to extend vision to the uttermost ends of the earth, be sprinkled on his eyelids as he sits at a modestly appointed breakfast or dinner table, he would recognize himself master of the world, as Alexander never was. For him would be conjured up a panoramic spectacle of pig-tailed laborers working in the tea fields of China, and of swarthy toilers gathering coffee in Java, and stripping the spice-trees of Sumatra. Sweating under the tropical sun in two hemispheres, millions of men would join the procession of those who were the slaves of his needs, to serve at his call every variety of luscious fruit. Ships for him sail or steam over all the oceans, and continuous lines of rails gridiron the larger portion of North America, probably soon destined to be bound by the same ties to the southern half of the continent. Prairies thousands of miles away furnish him bread and meat, and hunters scour the mountains and plains of the far West to offer him the spoils of the wilderness.

The limitations of season have ceased to be any bar to the demands of appetite. The development of cold-storage warehouses has banished in large measure the divisions of summer and winter, and the epicure can feast on pecan-fed turkey and canvas-back duck on the Fourth of July with as much relish as he can at Christmas.

Fish continually come into our markets, brought alive to their destination from a thousand miles away. Vegetables are conveyed by the steamer-load from subtropical regions, and one may enjoy green peas and strawberries before the winter blasts have done howling through the streets, and compelling the pedestrian to button close his top-coat over a shivering form.

The strength of a chain, however, is measured by its weakest link, and to fully grasp the enormous expansion of our market resources, and what that expansion involves, we must look at what they do for the poor man. The day-laborer toiling in the streets for a living is fed with products—making more than half of what he consumes—which travel a thousand miles or more before reaching the point of final distribution, and at very little greater cost than when he drew his supplies from a radius of fifty miles. Of course the rich man in all ages of the world has had a considerable command of luxury; but nowadays the man of the proletariat may easily have varieties of food which a well-to-do gentleman of the Elizabethan period could not have obtained. The grand developments of productive industry and of transportation facilities have made this whole big world of ours, farm, fish-pond, and game preserve, for the owner of the horny fist as well as him of the kid glove. At least it is so to a material extent in America, where the lower classes live on far better and more abundant food than in any part of Europe.

Neither New York nor any other American city has great and organized markets, conducted on the same extensive scale as can be seen in Paris and London, where municipal authority has an important part in regulating the methods of food supply. Beyond the revenue which New York acquires from the rental of market privileges, and a certain nominal control, exercised for the most part in a negative rather than in a positive way, everything is left to the individual enterprise of the venders, who act with fully as much freedom as if they transacted business out of the market. The same tendency, which has hitherto been the dominant fact in all our American industrial and commercial methods, to leave everything not only to personal initiative, but to personal management, has governed the conduct of our markets. As a corollary of this, we find in New York, which may be regarded as typical of other cities in similar directions, that our markets have been widely scattered and desultory in their operations, instead of showing the concentration of the great European market-places. It is for these reasons that New York has no grand market centre, nobly housed, with that dignity of external show and completeness of interior appliances which befit so important an interest in civilization and so great a city, the third, if not the second, of the world's principal capitals. The leading retail centre, which, of course, must be taken as the index of public spirit as directed toward market interests, Washington Market, is a sprawling concern, rebuilt from time to time, in whole or in part, to meet current needs, but always remaining an unworthy and insufficient structure. A superb public edifice, which should be one of the architectural glories of the city and a monument of civic enterprise, would alone embody the great demands centred in this class of industrial interests. It is to be feared that there is too much complexity and clashing of interests under the municipal system which has grown up in America to promise such a result as probable. The ordinance of 1879, which authorized the rebuilding of this market, seems to have contemplated, not a new building, but tinker's work; so it remains, like the ghost of Hamlet's father, "a thing of shreds and patches."

The new West Washington Market, devoted to wholesale purposes, ten to one, would not have been built had not the imperative claims of the Dock Department on the old site made progress Hobson's choice. We shall see, however, that the chief retail market of New York, in spite of its unworthy exterior, is a most picturesque and interesting place, well worth a visit even from him who goes with no intent to buy.

The history of New York markets is not without curious and suggestive interest. Though many of the old names have disappeared, nearly half of them exist in the line of legitimate succession. Washington and Fulton markets, the two most important retail centres, household names throughout the country, have a worthy genealogy; and, though with change of name, date back almost to the time when the jolly old Dutch burgher, who looked at the things of this life from an aspect quite contrary to that of the austere New England Puritan, made a study of the pleasures of the table.

Fulton Market, opened in 1821, was the successor of the old Vley, or Fly Market, which had been, from the earliest times, the head-quarters of the fish trade. So our great fish market has a hereditary fame, as becomes its genesis under the régime of the good Hollanders, offshoots of a country which for more than two centuries supplied nearly the whole of Europe with sea-food. Washington Market harks back to the old Bear Market, built in 1772, which again at an earlier date was known as Oswego Market. These two institutions are to-day the main distributing media of New York, though there are other minor ones, such as Catherine, Jefferson, Clinton, Tompkins, Centre, Essex, and Union, several of which were once of great importance.

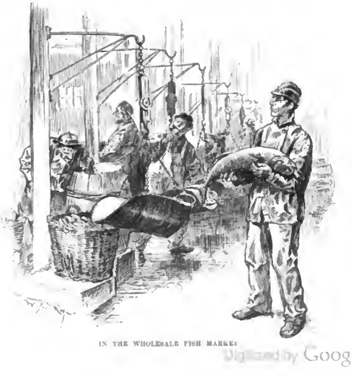
In sketching the features of the origin, shipment, and distribution of the food supply of New York, it will be proper to examine it first from the side of wholesale business, as this is indeed the main and all important aspect. When the city drew its main food supply from a radius of fifty miles, nearly everything was done on a narrow basis of retail methods. Now that all the resources of a continent are kept on tap to meet the expanded needs of two and a quarter millions of people, the machinery is vastly more complex.

It goes without saying that all study of market methods at New York must include the suburbs, great and small, which get their supplies from New York, and which essentially belong to New York, though organized under different municipal governments, and perhaps belonging to different States. Brooklyn, Long Island City, Jersey City, and Hoboken are essentially a part of the great city of Manhattan Island.

The new West Washington Market on Washington Street, between Gansevoort and Little Twelfth, is nominally the head-quarters of the wholesale market business. While it is true that the four hundred odd dealers who occupy places here represent an important part in the machinery of the provision business, it would be misleading not to strictly limit their functions. Many of these dealers, representing meats raw and cured, cured fish, poultry and game, vegetables and fruit, both native and imported, are commission merchants, though some of them are direct buyers, and really great wholesalers. In some cases, indeed, they almost control the handling of special lines of articles, but in no case does the mastery extend over the great staples, such as beef, pork, and flour, being confined to minor products, though the latter may be important in their kind. Most, if not all, of these dealers are members of the Produce Exchange, and probably take part in its speculative as well as its genuine transactions. A large portion of the dealings in this market, too, must be credited to the home and foreign export trade, and does not touch the question of local food supply. All statistics covering the business in articles of food are liable to this difficulty—the confusion of separating the figures of those products which are consumed for home supply, and those which pass through New York merely as a distributing point. For this reason it will not be practicable to give more than approximate estimates.

The first element to be considered in this survey will be the supply of flesh food, including in this only what is commonly known as "butcher's-meat"—beef, mutton, veal, and pork. This reaches New York in the shape of live cattle and dressed carcasses. The revolution of methods caused by the vast increase in the last-named method of bringing meat to market is full of interesting facts. It is already a veritable revolution, and it is believed by many who have studied the matter most closely that within a few years but little of the meat consumed in New York or other large Eastern centres will be butchered east of Chicago. Only a few years ago the preparation of meat for the final process of the kitchen fire was all done in local abattoirs long after the main supply of live cattle came from the distant West. The tremendous expansion of the dressed-beef business has been within the last decade. The scale on which it is done is well calculated to astonish the unaccustomed mind.

The houses which transact nearly all of this business are five in number: G. F. and E. C. Swift, George H. Hammond & Co., Armour & Co., Nelson, Morris, & Co., and the Armour Packing Company, the head-quarters of all of them being in Chicago. In the latter-named city the slaughtering and dressing of the cattle are largely carried on. These great establishments have also branch abattoirs and packing-houses at points like Omaha and Kansas City, a cardinal principle of the dressed-beef business being that the nearer the place of growth and fattening the killing is done, the better the quality of the meat. The transportation of live cattle for great distances not only subjects them to bruises and injuries



IN THE WHOLESALE FISH MARKET.

STANFORD LIBRARIES

1888. [illegible] employs 5000 men, and sold $80,000,000 worth of products. Its buildings will store 120,000 tons of meat, and the area of its cold-storage room is thirty acres. It slaughtered last year 1,160,000 hogs, 861,200 bullocks, and 184,540 sheep. Of course an immense quantity of this raw material was packed, but the dressed-meat business was little less great. The other establishments we have mentioned are projected on a similar scale, and the most advanced scientific methods are applied in the killing, dressing, and treatment of the meats. The stock-yards, with the great slaughter-houses which are located close at hand, were for many years quoted as among the most wonderful sights of Chicago to be shown to the tourist.

The various firms dealing in dressed meats have forty-two branch houses in New York, Brooklyn, and Jersey City, by which the product is distributed. It is brought from the West in refrigerator cars, each firm having a special kind of car of its own device, and owning its own rolling-stock. Several of them own from two to three thousand refrigerator cars each, and shipments are made to all important points East and South. The business was started with Boston as a head-quarters about ten years since, but New York is now probably the greater centre of distribution. All live-stock slaughtered in Chicago are examined by officers of the Board of Health before and after killing, and the most rigid precautions taken against diseased meat. Carcasses are stored twelve hours at a temperature of 50°, and then they are removed to refrigerated rooms kept at a temperature of 28°, where they are retained twenty-four hours longer before shipment. The refrigerator cars are chilled by the use of ice and salt stored in tanks, and so arranged that the cold air comes to from the top. The temperature is kept at 38°, and it can easily be seen that when the meat arrives in New York it is in splendid condition. There are icing stations disposed along the route where the refrigerating tanks are reoppiled. The storage-rooms, where the carcasses are held awaiting sale, are of the same temperature. This method is the same winter and summer, though it need hardly be said that for three months the need of artificial refrigeration is not great. Sales are made at the storage warehouses directly to butchers, jobbers, and market-men, and the terms are in nearly every case cash. The largest sales are made by the Swifts, Armour & Co., and Hammond & Co., the first-named doing two-fifths, probably, of the whole business. The local sales of Western dressed meats in New York and environs (this estimate carefully excludes exports and places for which the city is a distributing point) for 1888 were about 230,000 carcasses of beef = 184,750,000 lbs.; 300,000 calves = 37,500,000 lbs; 75,000 carcasses of mutton = 4,125,000 lbs.; and 75,000 hogs = 10,500,000 lbs. The export of dressed beef to Europe from the port of New York is also a growing business of great importance, as it likewise is at the port of Boston. Entire steamer-loads are frequently sent, and many of the fast greyhounds of the sea, as well as the slower ships, are fitted up with refrigerator chambers for this kind of transport. These cold-storage compartments, with their apparatus, cost often $10,000, and are equipped

grew rapidly. [illegible] which prices are kept up is worth noting. Toward the end of an active day's sale small lots of cattle will often have survived the keen bidding. If these were sold at a low price, butchered, and put on the market at reduced figures to the retail butchers, it would tend to lower the general wholesale price of meat. A great establishment like Schwarzschild & Sulzberger is therefore obliged, in self-protection, to rush in and buy up these scattering remainders at a high figure, to take away all excuse for a drop in wholesale rates, which, of course, would affect the prices of meat from animals purchased, at a stiff figure, directly in the West for through shipment.

The receipts of live-stock in New York, exclusive of exports, for 1888, were 363,293 cattle = 254,306,100 lbs., dressed weight (about); 263,734 calves = 329,655,000 lbs. (idem); sheep and lambs, 1,865,000 = 74,624,000 lbs. (idem), and swine, 1,552,102 = 139,965,300 lbs. (idem).

It is now practicable for us to arrive at some approximation of the total amount of butcher's-meat eaten in a year by the 2,500,000 people who live in what may be called the metropolitan area of New York. The figures would be about as follows: 438,056,500 lbs of beef, 367,163,000 lbs. of veal, 78,749,000 lbs of mutton and lamb; and 244,465,300 lbs. of pork; total, 1,113,778,000 lbs. How much of this is diverted to the uses of the manufacturers of cured meats; how much is sold to steam-ship lines and the watering-place hotels North and South, which have their supplies sent from New York, it is not easy to estimate. It is not less difficult to compute just what fraction of the total must be credited to the outlying provincial towns in at least three States which depend on the New York market for their fresh-meat supply. When a fair deduction is made on these grounds from the aggregates given above, it is reasonable to put the *per capita* daily consumption of butcher's-meat, including bone, for the two and a half millions of the great metropolis at about one pound. Recent estimates put the London consumption per head at about half a pound, and that of Paris at less than three-eighths of a pound. The vast waste of raw food in this country by unskilful cooking and careless habits is too well known to need comment.

Next in importance in the food supply of New York comes fish, an article of diet which to many peoples is the main item of flesh food. Fulton Market has been, since there were any markets on Manhattan Island, the distributing centre of food drawn from the finny tribes of river, lake, and ocean. Probably no city in the world has so varied and interesting a fish market. A sea-coast of two thousand miles of ocean contributes to its resources, and the largest lake system known adds varieties of fresh-water fish. Salmon from the Pacific coast and from Canada are set off against pompano and red-snapper from the Gulf of Mexico. It is no exaggeration to claim that no market can offer, as ours does, not less than three-score excellent kinds of food-fish in their different seasons. Many of these are unsurpassed in delicacy and richness of flavor. Even the vaunted sole and turbot of our British cousins cannot claim the palm over such deli-

storage, which are being rapidly extended every year.

A few years ago statistics of the business were kept in the wholesale market at the instance of the United States Fish Commissioner, but this has been discontinued. According, however, to one of the oldest and most respected dealers, the average sale of fish in New York is 300,000 lbs., or 150 tons per day. Fully half of this finds its ultimate market out of New York. The wholesale fish merchants, who stand at the entrance of the stream of supply, exercise a curiously strict etiquette in their dealings. They sell only to market-men and other minor dealers. They refuse to sell even to the great hotels, some of which, especially at the important watering-places, use thousands of pounds every week. The latter must look to the retail venders for their supply, who thus combine in many cases a heavy wholesale business with their regular market trade. This scrupulous dealing creates an *esprit de corps* and community of feeling in the fish-mongers' guild which do not exist in many other branches of the market. Reckoning half of the sales made in the wholesale division of the trade as meeting the local demand, we have a yearly distribution of fish in the metropolis amounting to 27,375 tons, or 54,750,000 lbs.

No city in the world devours more shell-fish than New York, and of course in this section of food exchange oysters hold the leading place. The head-quarters of the business in this delicious mollusk are on the North River, at the foot of Tenth Street. Here are moored some thirty or forty large barges, with their heads to the pier, each one of which is occupied by a wholesale dealer. Strings of wagons from restaurants and hotels are continually coming and going, and the little army of porters, with baskets of oysters on their shoulders, going back and forth over the gang-planks make a busy scene. Passing through a barge to the rear, we find ourselves looking on a broad basin crowded with oyster smacks discharging their cargoes. The rank yet not disagreeable odor of shells pervades the air, and the faces of some of the old oystermen who lounge about or take part in the labors of the scene are as brown and knotty and weather-grown as the plump bivalves themselves. These barges have the business offices in an upper story, and the hold and the platform story are filled with oysters in heaps or in baskets. The fish which for the most part finds an outlet here is grown, or at least fattened, in Long Island Sound as far east as New Haven, and in the bays and estuaries of the ocean on the south side of Long Island and the New Jersey coast. Rhode Island and Massachusetts send some oysters to our market, as also do Maryland and Virginia, but the amount is comparatively small. Large quantities of Southern oysters are brought, however, to the waters adjacent to New York, and fattened there for six months or perhaps a year; and still larger numbers of seed oysters are planted in the vast submarine nurseries, which make the water acreage so much more valuable than the land.

The dealers controlling the oyster trade own an extensive fleet of smacks, and to a considerable extent do their own planting and rearing. They follow largely the same methods which guide the fish merchants of Fulton Market. They

problem. Game, fish, meats, poultry, and perishable fruits and vegetables can be kept by refrigeration or cold-storage, as the case may be, perfectly good for any length of time at a small expense. The system, important as it is in its present stage, is destined to a much greater expansion. There are now a score or more of these places in New York. Most of them use ice and salt as the agents of cold. This apparatus serves its purpose well, except where extreme cold is needed, but it is subject to a great defect. The cold air produced is a damp chill, and for that reason its preservative agency is not as perfect as that effected by the dry cold which results from the process known as mechanical refrigeration. This requires a very expensive plant, and is shown at its best in the extensive warehouses under the Brooklyn Bridge and at St. John's Park. The *raison d'être* of the work done is the liquefaction of gaseous ammonia, which is made, by the intense refrigeration resulting from the change, to communicate its chill to brine. The latter body is reduced to the temperature of zero, and carried by the action of force-pumps through piping around the walls of all the storage-rooms in the warehouse. The rooms are rendered more or less cold according to the number of pipes carrying the brine, and can be exactly regulated to any desired stage of cold. The average temperature of the freezing-rooms is 15° Fahr., but when more cold-storage is needed the thermometer does not need to be greater than from 36° to 40°. So dry is the air that one may pass through the rooms comfortably, dressed in ordinarily light clothing. Here are to be seen great quantities of frozen fish, game, poultry, dressed meats, etc., each systematically arranged for identity of ownership and for rapid handling. A curious financial result has been the outcome of the cold-storage system. A dealer who has warehouse receipts can raise money on the security from his bank as easily as he could on stores in a bonded warehouse or on "elevator" receipts. The perishable nature of the security had hitherto made such a convenience impossible. It is estimated that during the year about 36,000,000 lbs. of market material are held in a frozen state for summer use, in addition to the still larger amount temporarily kept in what is known as cold-storage.

Without attempting to deal with any of the innumerable minor articles which constitute so much of the business of a great market, let us glance hurriedly at some of the statistics of annual supply in a few of the lesser staple articles. The local sale of eggs in the metropolis of New York in 1888 reached 792,195 barrels = 5,545,330 dozen, derived from home production; and 5909 cases = 26,545 dozen, imported; total, 5,571,875 dozen. Eggs, as is well known, by skilful packing can be kept in a decent state of preservation for about eight months. The butter used by the same population was 1,693,428 packages = 84,671,400 lbs. The American cheese sold in our markets and provision shops last year was 630,176 boxes = 3,150,880 lbs.

The great vegetable staple of the United States is the potato, and it is perhaps the most important item in the feeding of the poor, when the smallness of the domestic crop does not make it too costly, and then the cabbage largely takes its place. In 1888 there were received and locally purchased in New York 1,367,730 barrels from domestic points, and 48,485 barrels imported. The stock potato, of course, comes from all portions of the North and West, and the early potato is received from Bermuda and the Gulf States. The estimate of daily use in New York is about 8000 barrels a day. It will be a surprise to many to know how large our imports of this vegetable are at times. Some years New York alone receives for her own use from abroad upwards of a million barrels. This is not entirely agreeable to those notions which conceive the United States, with its variety of soils and climate, as boundlessly fecund in all the staple necessities of life.

An important development of market resources has come of the wonderful growth of garden-truck farming in Florida, Georgia, Alabama, and South Carolina. Hence New York receives nearly all its early vegetables in the late winter and early spring. The quantities sent on by the Southern market-gardeners give bright business to a large fleet of steamers, and form an important item during the season in the receipts of the Southern railways. As the season advances through the later spring the more northerly States of the South yield their quota to our needs. In fact, there are only about three months in the year when the full variety of fresh vegetables may not be had in the markets, though of course at very different prices, according to the season. It is almost impossible to find any reliable statistics as to the amount of what is known, in market phrase, as "garden truck" annually consumed by the people of the metropolis, though a happy guess might be made as to the average total by using other statistics as a point of departure.

During the summer and fall season the picturesque "Farmers' Market," held three times a week in Gansevoort Square, adjoining the new West Washington Market, is one of the most important factors of supply. Here great wagons and vans loaded with produce from the farms within a radius of a dozen miles collect, and the farmer is brought in direct contact with his customers. The scene is one of the most animated and characteristic spectacles in New York life, and well worth a visit in the early hours of the morning, when the traffic is at its height. This lively mart, oftentimes consisting of a thousand wagons, which overflow for several blocks about the square, is the source that supplies most of the grocers and minor markets in the upper part of the city with vegetables. The amount of business transacted here has been estimated by a competent judge to reach more than $5,000,000 annually. Commission produce dealers, who traffic in all kinds of staple vegetables, swarm by the hundreds around all the market centres. Here may be seen every variety of fruit and vegetable, domestic and imported. Next the store filled with homely apples, potatoes, beets, and turnips, we find a fruit-house, balmy with all the spicy odors of the East, and brilliant with glowing masses of oranges, lemons, pineapples, and bananas, suggesting all that is tempting and luscious.

The tropical fruit business has grown to such great proportions that only a few words can be said of it in passing, as it separates so widely from ordinary lines of market traffic. We draw largely from our own subtropical regions, but the West Indies, Central and South America, the Mediterranean countries, and the coast of Asia Minor also contribute to our supply of these luxuries. The fruit schooners constantly arriving and departing from this port, with their crews of quaint-looking swarthy sailors, make one of the most picturesque minor spectacles on the New York water-front. It is perhaps within bounds to claim that this city is the most important tropical fruit market in the world. Those who are curious to know more of the commercial methods pursued in this interesting business are referred to an article on this subject in HARPER'S WEEKLY of January 26, 1889.

A walk through Washington and Fulton markets, the two leading retail food centres of New York, is well worth the trouble. Here may be found almost every variety of food known, embracing the luxuries and the necessities of life. In these democratic resorts the richly clad lady is jostled by the woman in rags, and people of all classes stream back and forth through the avenues. The scrupulous cleanliness and neatness, and the artistic sense of contrast and arrangement often shown in the arrangement of the stalls, are noticeable. The great fish stand in Fulton Market—that conducted by Mr. Eugene G. Blackford, whose name is famous among those interested in pisciculture—is a marvel in the brilliancy of its color tones, and would make a study for the painter. The *habitué* of the market who learns to recognize faces will often be surprised to find that the jolly butter-man or butcher with whom he deals may be seen any afternoon, in swell costume, tooling a pair of thorough-breds on the Bloomingdale Road or St. Nicholas Avenue. Large fortunes have been made, and are being made, in the markets. How could it be otherwise in a traffic covering the most important material needs of mankind, and at the same time pampering the most tempting tastes of self-indulgence?

STANFORD LIBRARIES

Book I. From the Beginning. Book II. The Incarnation. Book III. The Divine Human Fellowship. pp. xii. 270. Post 8vo, Cloth $1 25.

It is not a theological work, nor in any way controversial. It is a consideration of Nature and Humanity as an unfolding of the divine life without reference to any outward authority; a view of the truth of life as unfolded from the life itself—a view in which Christ takes the central place not only in the Gospel revelation, but also in all true explication of Nature and Society.

THE LODGE BILL.

THE advantage of long and thorough discussion of proposed public measures by the press is shown by the form in which the national election bill has been introduced in the House by Mr. LODGE, of Massachusetts. The admitted situation in many Congressional districts, especially in Southern States, the frank and unreserved declaration that a portion of the legal vote should be and certainly would be repressed in the interest of society itself, the distinct declaration of the successful party at the last Congressional election that this situation ought not to continue, the harmony of this declaration with the great Republi-

ferred. The same thing is true of a Republican Judge. But it ought not to be assumed as probable in either case, for United States District Judges are generally men of high character and reputation. Mr. CARLISLE is reported as saying that the registration, reception, canvassing, and returns of votes are State rights, and cannot be assumed by Congress. But there can be no doubt of the intent of the Constitution to protect, if deemed necessary, the entire election. If this were not the intent the Constitution would have been silent. The words "times, places, and manner" are plainly designed to comprehend all details. At least the contrary must be very clearly shown. The statement that it is unprecedented, the uniform practice having been exclusive State control of elections, is true; but it might be answered by the statement that the situation is unprecedented, and if the practice has been uniform, it is because adequate reason for a change has not hitherto appeared. Opposition to the bill ought not to be placed upon Constitutional grounds. It is a question not of State right in the legal sense, but of national expediency.

DIVIDING THE PIE.

THE demoralizing effect of a surplus is shown by recent legislation in the House of Representatives, which in two days appropriated more than three millions of dollars for public buildings in various parts of the country. Nearly eighty bills have been reported, which, according to the average amount of those that have been passed, would make an aggregate appropriation for this purpose of more than fourteen millions of dollars. A little scrutiny shows the foolish waste of many of these grants. A member from Alabama asked and received an appropriation of $40,000 for a post-office in a town of less than 2500 inhabitants, where the postal receipts at "the small and poorly managed office now existing" were reduced by the establishment of branch offices. The House passed a bill giving $50,000 for a public building in a country town in Louisiana, with a population of 1800 persons. York, in Pennsylvania, a town of 21,000 inhabitants, would like $150,000, and the

country should keep a vigilant CLERK in Congress to secure the largest possible slice.

THE MORAL OF THE CITY INVESTIGATIONS.

THE disclosures made by the investigations of the Sheriff's office and of other branches of municipal administration, and the FLACK trial, throw a very strong light upon the methods of municipal administration in New York, and of its utter laxity, ignorance, disorder, dishonesty, and criminal extravagance. The revelations of the interior of Ludlow Street Jail, which are the result of the suggestions of the *Herald*, recall the descriptions in the English novels of the last century of the sponging houses and houses of detention in London. Meanwhile the new Street Commissioner has apparently abandoned the hope of cleaning the streets. This is not surprising. The only surprise is that anything else should have been anticipated. There is nothing more evident than the disgraceful condition of the streets, except the impossibility under existing circumstances of escaping the disgrace. When Mr. LOOMIS was appointed Commissioner, it seemed, undoubtedly, that a great opportunity was opened to him to earn public applause and gratitude in the simplest manner. Like the small boy in *Pickwick*, he was exhorted "to go in and win." But, as we said at the time, while it is universally agreed that he has the qualifications, "is he a free agent? Can any officer in his position be a free agent?" We added:

> "If he resolutely devotes himself to his work, doing it as it ought to be done, and as he can do it, he must, first of all, refuse to appoint assistants because politicians want them appointed, and select them solely because they are the best men. How far does a vigilant press think that a Street Commissioner appointed by Tammany Hall would advance upon that road without challenge?"

Time has hastened to justify our question. Mr. LOOMIS evidently discovered immediately that the conditions under which the work must be done made its proper performance impossible. The whole business of street cleaning is a signal illustration of the character and consequences of government by Tammany Hall. That institution exists for the purpose

is equally associated with the familiar shameful and scandalous wrongs of misgovernment in the city of New York. The remedy lies in the union of all honest and intelligent citizens of all parties to secure, or to try to secure, good municipal government. This is so evident that the refusal of the Republicans to support Mr. Hewitt for re-election in 1888, under the pretence that there was a chance for their own party, was a deliberate division of the anti-Tammany vote, and an alliance with Tammany Hall, resulting in an apparent verdict of the city in favor of Tammany rule. This fact should be remembered by all honest citizens when another election occurs. Relief from Tammany rule is impossible so long as the city election is made a party contest.

BISMARCK.

The telegraph is carefully guarded in Berlin, but the fact of serious differences of opinion between the old Chancellor and the young Emperor had been long generally understood, and the Chancellor's resignation at any time during the last few months would not have been surprising, and his final retirement, now assured, is an event of the first importance. Bismarck will always hold a high place among the great statesmen of Europe. Take him from the history of Germany during the last thirty years, and its most powerful figure disappears. Indeed, since Stein there has been no figure like him. The chief European names in the state-craft of this century are Stein, Pitt, Canning, Talleyrand, Metternich, Cavour, Nesselrode, Bismarck, and Gladstone. Among all these famous men Bismarck is eminent, and the actual constructive work of none of them is probably greater than his, except that of Stein, whose service in awakening a patriotic spirit in a country in which it seemed to have perished is unique in history. The same fervor of patriotism is the distinction of both men. If Stein revived German feeling, Bismarck organized into an actual empire the sentiment of the father-land.

Germany was a geographical expression fifty years ago. There were German states, and a German enthusiasm survived in feeling and song from the earlier days of the century; but a political and united Germany was the aim and is the achievement of Bismarck. His ambition has not been personal, but patriotic. His sobriquet, a man of blood and iron, expresses a resolute will bent upon accomplishing its ends at any cost. Yet Bismarck's great purpose has been accomplished in a spirit which is not that of his own time. He has not been in sympathy with what is known as the modern spirit. Constitutions and parliaments and a limited monarchy are not to his taste. He has been, however, too wise to suppose that he could dispense with them. But his dominant conviction seems to have been that a nation cannot govern itself, and must be governed by a trained, unquailing, conscientious, independent, irresistible personal authority. So far as circumstances would permit, he has enforced Carlyle's theory of kingship, repressing the scorn for government by wind of voice and count of heads which Carlyle, a private and irresponsible personage, picturesquely expresses.

There has been less personal knowledge and current gossip about Bismarck than about any noted character of the time. The most intimate and interesting personal glimpses of the man are those contained in Motley's letters. Bismarck and Motley were at the University of Göttingen together, and each fascinated the other. Their friendship remained unchanged as long as Motley lived. In the brilliant American the stern German saw what lofty citizenship a republic produces, and what ardor and generosity of patriotism it fosters, and in the imperious German the American saw the upright purpose and love of country which may coexist with implicit faith in despotism. In his last great speech two or three years ago, to which it may be said the whole world listened, Bismarck paid a touching and tender tribute to "my dear friend John Motley." As Bismarck retires, the most commanding public figure of our time disappears. Criticism, censure, condemnation, in many forms and for many reasons, doubtless await him. But it will be always said of him, and truly, that he loved his country and politically created Germany.

JEFFERSON AND THE SPOILS.

Mr. John M. Merriam, of South Framingham, in Massachusetts, has sent to the Boston *Journal* a detailed list of more than a hundred instances of removals from office by Jefferson. The facts in regard to Jefferson's action had been always variously stated until a letter of his own settled the question. A contemporary Federal pamphlet published in the first year of his administration specifies twenty-nine officers "dismissed .... on account of their political opinions." In 1830 Senator Holmes, of Maine, said to the Senate that "after diligent search" in the Journals of the Senate he had found but thirty-six. In 1835 Mr. Calhoun put the number at forty-two. In 1850 Mr. Truman Smith, of Connecticut, said in the Senate that House document No. 132 of the First Session of the Twenty-sixth Congress showed that there were fifty-eight removals during Mr. Jefferson's two terms. Jefferson held that the civil service should be "equalized" between the two parties. Like many of his theories, this was utterly impracticable. The spoils system was already established in New York under the Council of Appointment, which even refused licenses to auctioneers of the wrong party. The outrageous partisan abuses of the power of appointment and removal under the Council was one of the chief reasons for calling the Convention of 1821 to draft a new Constitution for the State.

When Jefferson was elected, Duane and the other spoils politicians of his party in Pennsylvania insisted that the President should make "a clean sweep." Jefferson resisted, and tried to placate the plunderers by his plea of equalization. On July 24, 1803, in a letter written at Monticello to Duane, to which Mr. Merriam refers, and which is printed in Adams's *Writings of Gallatin*, Jefferson says:

> "Many vacancies have been made by death and resignation, many by removal for malversation in office, and for open, active, and virulent abuse of official influence in opposition to the order of things established by the will of the nation. Such removals continue to be made on sufficient proof, the places have been steadily filled with Republican characters, until of 316 offices in all the United States subject to appointment and removal by me, 130 only are held by Federalists. I do not include in this estimate the judiciary and military, because not removable but by established process; nor the officers of internal revenue, because discontinued by law; nor postmasters, nor any others not named by me. And this has been effected in little more than two years, by means so moderate and just as cannot fail to be approved in future. Whether a participation of office in proportion to numbers should be effected in each State separately, or in the whole States taken together, is difficult to decide, and has not yet been settled in my own mind."

He then proceeds to point out that in Pennsylvania there were only eight offices within his control, and that of these eight, five were already held by Republicans and three by Federalists, while every subordinate officer was "appointable" by the five Republicans, and "not a single one" by the Federalists. He adds that the only trouble under his administration has arisen from the distribution of offices. This is a statement which is very credible, since a member of Congress recently said that he had received five thousand applications from his own district alone. Of course this gentleman was entirely prevented from attending to the public business for which he was sent to Washington. Jefferson pulled out the bolts of the floodgates, and tried to hold them against the torrent by his absurd equalization. Jackson opened them, and the flood overwhelmed both the service and honest politics. The more completely the infamous story of the spoils system is told, the more certain is reform.

A RELIC OF BARBARISM.

The death of Mr. Taulbee in Washington and the imprisonment of Mr. Kincaid to await trial for murder is a commentary upon the practice of carrying loaded pistols which will be probably heeded. The deadly Goodloe combat in Louisville and this event in Washington are signs of a barbarous condition which disgraces the good name of the country. There is no excuse whatever for the practice in the "Southwest" more than in the Northeast, in Washington than in Portland. It is the product of a semi-savagery, and it is the chief means of perpetuating it.

Yet there is but one remedy, and that is local public opinion. Every man who palliates the practice, or who makes the participants in a deadly street fight heroes, or who does not earnestly denounce the practice as a cowardly and treacherous habit, indirectly promotes and strengthens it. The street brawls which are customary where concealed weapons are carried are worthy of Ashantee, but they disgrace America.

It is a curious illustration of the perversion of public sentiment that communities in which a difference of opinion or a volley of blackguardism ends in sudden murder plume themselves upon a high sense of honor. Duellists have always been under the ludicrous delusion that they were sensitive upon points of honor. Whatever it is that they mean by the word, it is something that is shared with cats and dogs, which are very prompt in resenting what they evidently regard as insults to their honor.

THE BLAIR BILL.

Mr. Jay has been a much more effective advocate of the Blair bill than its author, and in a letter addressed to Senators Evarts and Hiscock of this State he sums up the case for the bill very strongly. In saying, however, that the opposition comes "partly from the prejudices engendered by slavery, but chiefly from the opponents of our common-school system," Mr. Jay overlooks such opposition as that of Senator Hawley, of Connecticut, and other Republican Senators, which is shared by a very large and intelligent body of citizens, and is founded upon the conviction that the education which the bill contemplates may be left much more wisely to the States, and that such national aid for such objects is to be deprecated for many reasons.

This, and not the other, is the serious ground of objection to the Blair bill among those who share the philanthropic views and patriotic spirit of Mr. Jay. The opponents of the common school system to whom he alludes are the supporters of the Roman Catholic scheme of a sectarian division of the school fund. But this opposition is confined almost exclusively to the members of that communion. No proper American body of citizens holds any such view. The non-sectarian American public-school system has no warmer or more intelligent friend than Senator Hawley, who is also one of the most resolute and most reasonable opponents of the Blair bill.

By a vote of 36 to 32 the Senate has refused to order the bill to a third reading. The majority was composed of 20 Democrats and 16 Republicans, and it is regarded as sufficiently decisive to kill the bill for this session at least. The precedent of an enormous grant of public money to the States for any purpose which can command a majority in Congress therefore, as yet, failed of being established.

THE ADIRONDACK PARK.

The Governor has signed the Adirondack Park bill, saying very truly that it is good enough as far as it goes, but that it ought to go a great deal farther. The bill appropriates $25,000 for the purchase of lands, and it is very important as the beginning of the policy of State purchase, which the Governor in this instance trusts may lead to a more substantial and adequate measure.

As Mr. Harrison, the Secretary of the New York State Forestry Association, also truly says: "Timber should be cut when it is ripe. That is what it is for. But it should not be butchered and exterminated, and the soil burned out and swept away, so as to leave great areas as barren as the central desolation of Sahara."

The evil is very serious and very threatening. But individual protests are of no avail against the organized interests which are destroying the forests and drying up the sources of streams and rivers. A similar organization of lumbermen, hunters, and all who visit the woods for health or pleasure, with all who know the public consequences of the devastation which is going on, will prevent it. That is the simple object of the association which makes individual opposition effective.

PERSONAL.

Miss Elaine, one of the Goodale sisters, whose verses brought them into prominence before they were out of short dresses, and while they still lived on their father's farm in western Massachusetts, has been made Superintendent of all the Indian schools in the new State of South Dakota. After teaching the Indians in General Armstrong's school at Hampton, Virginia, for several years, she became a teacher at the White River Camp of the Lower Brulé Agency. Her preliminary work has shown her to be well fitted for the difficult place she is now to fill, and her progress will be watched with interest by the many who believe in education as one of the most potent means of regenerating the Indian.

—There is an interesting story connected with the naming of Miss Anna Gettysburg, the daughter of Judge Wheelock G. Veazey, of Vermont, now a member of the Inter-State Commerce Commission. Young Veazey was in Dartmouth College at the breaking out of the war, and left his studies to join a Vermont regiment. Before going to the front he was married to the lady of his choice. During the battle of Gettysburg, and while Colonel Veazey was leading his regiment in the thickest of the fight, a girl baby was born in the home among the Green Mountains. She was christened Anna Gettysburg, and has now developed into a stately young woman of more than ordinary beauty. Miss Veazey has been one of the prominent figures in Washington society this winter, and is soon to be married.

—A "hoss trade," and a white horse at that, is said to have been the beginning of the fortune of the late Judge John B. Davis, of Montana, who was worth his millions, and was called by some the wealthiest man in the State. Back in 1861 he started from Iowa for the mining camps of Montana, taking several cart-loads of goods with him. These he sold at a profit; and then he traded an old white horse for a mining claim, which the discouraged owner wished to give up. The claim proved most valuable; and after Judge Davis had made a fortune out of it he sold it for a million dollars. At the time of his death he was interested in a number of other profitable ventures, and was one of the leading men in Montana. He was never in public life, however, and the sobriquet of "the Judge" was bestowed on him on account of his association with a vigilance committee when lynch-law was the only acknowledged restraint of the mining camps.

—Prince Albert Victor, the eldest son of the Prince of Wales, is looking for a wife, and as available princesses are not very plenty just now, it is said that his father would not be averse to union with an American girl if she had the proper requisites. Queen Victoria would hardly permit a match outside of royal circles, however.

—Some of the Vassar students are taking steps to endow a chair of astronomy in the college in honor of the late Maria Mitchell.

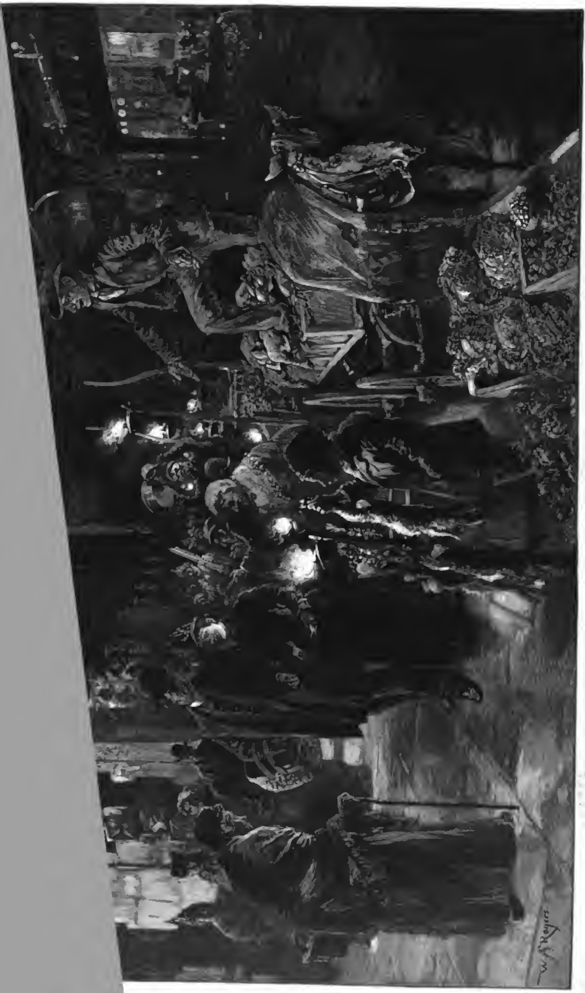
—Joshua Hood, one of the committee appointed to welcome General Lafayette during his visit to this country in 1824, died recently in Baltimore at the age of eighty-seven.

—Ex-President Cleveland's successful venture in real estate seems to have inspired his successor at the White House with a desire to profit by similar investment, as President Harrison has recently bought two pieces of improved Indianapolis business property for $21,000.

—For some time many of the ladies who ride after the hounds in England have advocated sitting astride of their horses like men, and it seems probable that they will carry the day. Now Miss Mabel Jenness, the American apostle of physical development in women, seeks to introduce a similar reform on this side of the water. She claims, and with apparently good reason, that the use of the side-saddle develops only one-half of the body, and tends to a lateral curvature of the spine. Miss Jenness has prepared a new riding-habit with bifurcated skirts, and having tried sitting astride of her horse, finds that in this position she can ride more gracefully as well as healthfully.

—The statement that Squire Massey Beasley, of Aberdeen, Ohio, the officiator at so many runaway marriages, has during the seventy-seven years of his life withstood the soft promptings of matrimonial example, is indignantly denied by a friend of his. He is a widower, and has had several children. Those who seek his services come generally from Kentucky, for he will not marry persons from Ohio. He requires no marriage license, but over in Kentucky his marriages are legalized by special law.

Google



SATURDAY NIGHT MARKET ON NINTH AVENUE, NEW YORK.—Drawn by W. A. Rogers.—[See Page 242.]

or eight cents a pound. They are not Philadelphia dressed, but they are very likely to be good. Turkeys and ducks are proportionately low. Fish abound generally, though sometimes prices are too high to warrant the peddler in taking any chances. That great culinary possibility, the cod, seems to be the favorite, though there is always a considerable variety of other kinds. It is best not to look here for salmon, pickerel, or other game fish. Vegetables of every kind are in superabundance, and at prices one quarter to one-half lower than exacted by the grocers. In purchasing, a close observation of the peddlers' weights and measures is a very material part of the success of a night's shopping.

The street market is certainly a boon to the provident wage worker, and a most practical argument to induce the shiftless to mend their ways.

SCOTT THOMPSON.

RUSSELL SAGE.

BY EDWARD G. RIGGS.

WHILE it is admitted that Russell Sage has a substantial place in the community, there has always been some speculation as to the precise niche which he occupies in the affairs of men of this generation. Although associated with financiers and men renowned in the great corporations of the country, Mr. Sage's warmest friend would scarcely have the hardihood to speak of him as a financier, or rank him with the men whose daily lives for a quarter of a century here in New York have been as an open book to him. In Wall Street and in the financial arena, both at home and abroad, the interpretation given to a financier is confined to the little handful of men who conceive and who carry to successful culmination vast enterprises requiring at times the most comprehensive knowledge always associated with defiant courage. Mr. Sage has never been associated, at least in a public way, with any of these vast enterprises. But while he is not a financier of this class, he is one unto himself. His position in the community of Wall Street is summed up in these words: strange as it may appear after the remark that he can in no sense be numbered among the financiers of the generation, he can, nevertheless, take hold of almost any financial enterprise and put it upon a solid basis. Though the venture may be toddling along in weary fashion and in danger of utter collapse, with Mr. Sage at the helm and given undisputed authority the chances are that something will come out of it.

He is a financial economist. In a twinkling he can stop a leak, and make each penny in the treasury assert itself. He has neither the courage nor the temperament to bring to successful culmination the great enterprises of a Rothschild, a Vanderbilt of the old line, or to indulge in movements inaugurated by such a banking firm as Drexel, Morgan, & Co. But in his shrewd and calm judgment he can bring order out of almost any entanglement which may beset the treasuries with which financiers have to deal.

Although a member of the New York Stock Exchange for twenty-five years, he has never put foot upon the floor. His vast fortune of forty or fifty million dollars is constantly added to by dividends and interests rather than by speculations in stock. He is a great lender of money to bankers and brokers, and most of the hours in his business day are devoted to rolling up wealth in this way, and to attending the meetings of directors of corporations in which he is personally interested. For this he receives five dollars for every meeting. He still does a modest business in puts and calls, although from that hot day in June, '84, when he was reported to have lost seven million dollars, he has seemed to gradually curtail this branch of his business.

Few men in New York are on intimate terms with Mr. Sage. Although pages have been written about him, he is fond of remarking that the contents of the articles are of the most superficial character. It has frequently been said that Jay Gould is the only person in the city who is thoroughly acquainted with the career and methods of this unique money gatherer. In some respects this is true, and in others not. Mr. Sage is seventy-four years old, and in a sense is without a contemporary in the financial community. He was approaching fifty when he first met Mr. Gould, and from childhood he has been the reverse of voluble concerning his affairs. Mr. Gould was quite an insignificant person in finance when he first met Mr. Sage, almost thirty years ago. Mr. Sage, on the contrary, had at that time established his reputation as a wealthy man and also as a financial economist. He was known, too, and consulted by the eminent politicians of those days. Although within a few months of seventy-five years of age, Mr. Sage can truthfully be classed among the youngest men of New York. With scarcely a wrinkle in his face, with a step as brisk as a youth's, he has also many of the almost blithesome personalities of much younger men. His hair of iron-gray is as thick and profuse as when a school-boy in the Mohawk Valley. His eyebrows are heavy and almost shaggy, and there is just the faintest suspicion of dye in the whiskers on his chin and throat. One of his most marked peculiarities is that in conversation a merry twinkle in his blue eyes lights up his face.

When on serious subjects, the lid of Mr. Sage's right eye winks like that of the heavy villain in a comedy. Occasionally, and especially when the subject is of more than usual interest, the lids of both eyes blink alternately and very rapidly, and then, as if regretting his manifestation of interest in the conversation, the blinking will suddenly cease, and the face will light up again like a summer afternoon after a shower. His mouth most of the time has what you would call a comfortable smile. While there is always an apparent frankness of manner, there are quick intervals of hesitancy, as of a man constantly on guard and thoroughly cognizant of the value of words. Mr. Sage is usually attired in what are ludicrously known in Wall Street as slop-shop clothes. They are ill-fitting, and if diversity of raiment is an evidence of Anglo-maniaism, Mr. Sage is an inexcusable example. His coat, waistcoat, and trousers are frequently of different patterns. His shoes are thick and enduring, and his scarfs are of homely patterns. But at all times his linen is of immaculate neatness, and the little jewelry he wears consists of a modest gold chain and watch.

In the presence of ladies Mr. Sage ranks as a gallant of the old school. There is a certain homeliness in his courtesy which is attractive. In business life he impresses one with the belief that he learned at twelve what the average citizen of thirty to-day does not seem to fully grasp—that is, that there is but little if any sentiment in a man's business relations, and that if a man has an aspiration for wealth he must insist upon value received every time and also give it every time. This may occasion comment leaning to the criticism of ingratitude, but the man who exercises these principles will invariably be the winner for all that. Mr. Sage has no children, and once in speaking to me of this, the moisture was seen in his blue eyes. It was when he referred to the sons that Commodore and William Vanderbilt had left behind them, and to the fact that Mr. Gould and other of his very wealthy friends had sons to take up their affairs after they were removed. Mr. Sage never uses the word "death." If anybody in his circle dies, he or she has been "removed," and he refers to his own departure as "when I am removed." His wife and a distant relative are the only persons close to this man's great wealth.

The career of Mr. Sage is a thing to be classified; first, as the poor grocery clerk for his brother in Troy, and then as a retail grocer in business for himself, and after that, successively, as a wholesale grocer, a ward politician in Troy, a dabbler in railroads which were afterward consolidated into the great New York Central system, a Congressman at Washington, and then as a director in some of the railroads which now comprise the transcontinental system. Last of all, he is to be considered as a money gatherer in New York, in which relation he has associated himself with twenty-five corporations of national fame. He is President of some, Vice-President of others, and a director in all. He is chairman of the finance and expense committees of the Manhattan Elevated Railroad Company, the Western Union Telegraph Company, and others, in all of which he serves in that capacity because of his ability to prevent waste. His career disproves the saying that a politician is a man spoiled for any other occupation. Mr. Sage has rather seized upon his knowledge of men gained during his political days, and made it of vast advantage to him in his later ventures. Perhaps the fact that he was in political life before the days of heavy assessments levied on candidates has something to do with his eminence among the wealthy men of America.

His father's family was on the way to western New York from their early home in Middletown, Connecticut, when Russell was born at Verona, in Oneida County, this State, in 1816. Russell Sage's birth stopped the journey at this little village, and there the family remained. The father took up farming, and the boy, at six, went to the district school. Eight years later he was an errand-boy in his brother Henry's grocery in Troy. His evenings were spent in study, and he joined a debating society, where the knowledge he acquired helped him when he became a member of the Board of Aldermen from the Eighth Ward in that flourishing city. From the first he was an out and out Whig, and remained in the faith when that grand old party took its new name just before the war.

In a few years he owned a grocery shop of his own, and in 1839, under the firm name of Bates & Sage, he enlarged his business and became a jobber. All the firm's supplies were received by sloop from New York, and distributed through western New England and the upper counties of this State by teams. In 1841 Mr. Sage married Miss Maria Winne, of Troy. She died in 1867, after Mr. Sage had taken up his residence in this city, and two years later he married Miss Olivia Slocum, of Syracuse, who had been a friend and school-mate of his first wife at Miss Emma Willard's seminary in Troy. Just after his first marriage Mr. Sage began to interest himself in speculative railroad stocks. He had been fascinated with a ride of sixteen miles over the Hudson and Mohawk, running from Albany to Schenectady. The name of this pioneer road was afterward changed to that of the Albany and Schenectady, and interested in it were Thurlow Weed, then editor of the Albany *Evening Journal*, and Louis Benedict, and a dozen other influential Whig politicians. From that hour Mr. Sage began to imbibe an interest in politics. He had himself elected chairman of the Whig committee for the Rensselaer Congress district, and he kept that place against all comers for twenty-two years. But he still kept his eyes on the railroads then building through central New York. He personally inspected the grading of the Utica and Schenectady, Syracuse and Utica, Rochester, Canandaigua, and Syracuse, and finally the Buffalo and Rochester Railroad, which completed the connections between Albany and Buffalo.

Wealth was rolling in upon him in the grocery business, and his partner, John W. Bates, retired with $150,000, a vast fortune for those days. In the mean time the municipal corporation of Troy had built a railroad between that city and Schenectady, and Mr. Sage, as a member of the Board of Aldermen, was made one of the directors of that road. He was afterward County Treasurer, and when he retired from that post he was elected President of the railroad, and held office when the road was consolidated with the general system between Albany and Troy and Buffalo. At that time, 1852, Mr. Sage was elected a director in the consolidated company, the New York Central. He served six years, and to-day is the only living member of the original Board of Directors. With the grocery business on hand, and while still engaged in these railroad enterprises, he continued prominent in Whig politics in Rensselaer County. By hard work he had secured the nomination for Congress in 1850, but was defeated by the Independent Whigs, known then as the Silver-Grays. Two years later he obtained the nomination again, and was elected. His majority was small. He was re-elected two years afterward by the unprecedented majority of 7000 votes. He had the support of the Know-Nothings, the Hunkers, and the Barn Burners. He carried all before him. He attributes part of his success in this campaign to a stirring speech he made before the Board of Aldermen at just about that time. He is a Presbyterian, and he created a great flutter by appearing before the Aldermen in defence of the rights of a venerable German Roman Catholic priest who had recently come to town to assume charge of that parish. The City Fathers immediately put a tax on the clergyman's property, although none of the Protestant clergymen were similarly burdened. Mr. Sage maintained before the Board of Aldermen that this was unfair, and called upon them to revoke their decision. He was successful, and all the Catholics forgot his Protestantism and voted for him.

He spent a most active life during those days between Washington, New York, and Troy. Standing on the Troy depot platform one day at about that time he first met Mr. Gould. Jay Gould had acquired control of the Rensselaer and Rutland Railroad, and the meeting of the directors to turn it over and make it a part of the present Delaware and Hudson Canal Company's system was to be held in the waiting-room of the depot. Mr. Gould turned $150,000 by that transaction, and Mr. Sage says "he did it without any dress-parade business either."

While in Congress Mr. Sage served with the late Vice-President Thomas A. Hendricks on the Invalids' Pension Committee, which had charge of the Mexican pensions. He served also on the Ways and Means Committee, and he recalls with interest the struggle, lasting five weeks, over the election of a Speaker, and which resulted in the elevation of General N. P. Banks to that place. Every year or so the surviving members of that Congress gather around General Banks, and recount stories of the struggle and General Banks's victory by one vote. With Galusha A. Grow, David A. Wilmot (father of the Wilmot Proviso), Senator Lewis Cass, William L. Marcy (President Pierce's Secretary of State), and Jefferson Davis, Secretary of War, Mr. Sage had a friendly acquaintance. With the first Mrs. Sage he lived at Willard's in Washington, and on Saturday nights would run over to New York, a trip that then consumed fourteen hours, to order goods for his grocery business in Troy.

Mr. Sage tells a story which, in his opinion, will convey a comprehensive idea of what a politician, or rather a statesman, ought to be. Just after the close of the Mexican war, when pæans of praise were being sung for General Taylor, popularly called "Old Rough and Ready," Mr. Sage was deputed by the Board of Aldermen of Troy to come to New York with a fellow Alderman and welcome Major-General John E. Wool, a citizen of Troy, on his return from the Mexican war. The saloon of the old North River steam-boat *North America*, in which the committee and General Wool were to return to Troy, was crowded with passengers. At the long dinner table there was a vast congregation, and Mr. Sage's colleague arose and addressed the audience in true spread-eagle style.

"Ladies and gentlemen," he thundered, "we have with us to-day the hero of Buena Vista. He is a child of Troy, and we are bearing him along to where beacons on the mountain-tops and songs in the valley will greet him. The thunders of artillery will tell of his return from glory. Our maidens will strew flowers in his pathway, and the matrons will welcome him as their guardian." There was fifteen minutes more of this, and the orator closed by presenting General Wool. The General received an ovation. He was easily flattered, and the speech had been accepted without a protest from him. He delivered a short address, and was cheered to the echo as "the hero of Buena Vista."

Mr. Sage was then introduced, and knowing full well that General Wool had accepted a compliment which should have been bestowed upon another, he started in to right matters. "I yield to no man or woman here," said he, "in extending the full measure of respect to our friend and neighbor General Wool. But I want to say a few words in behalf of one absent. His fame is known in every corner of this great country. He is a man of action, not words, and I want you all to unite with me in three hearty cheers for old Zach Taylor, the hero of Buena Vista," and Mr. Sage brought down his fist on the table with a crash that shook the glasses and rattled the china. General Wool and Mr. Sage's aldermanic colleague were silent until a great roar went up, and then they too swelled the applause. There were newspaper correspondents aboard of the *North America*, and they spread the proceedings far and near.

This occurred before Mr. Sage went to Washington as Congressman. In the rushing course of events General Taylor was elected to the Presidency, and at the same time William H. Seward became United States Senator. President Taylor did not like Mr. Seward. The Toombs and Stephens element, early in the Taylor régime, poured into the President's ears stories showing that Senator Seward was a rabid abolitionist, and bitterly opposed to the administration. General Taylor had been elected a Whig, though his enemies in the Philadelphia Convention, where he was nominated over Henry Clay, Daniel Webster, and General Scott, spoke of him as "an ignorant frontier colonel who had not voted for forty years." General Taylor was a slave-holder, and although Senator Seward was a prominent Whig, he could not get any patronage, and there were complaints from Thurlow Weed and others of his constituents. The President, in fact, nominated to Federal office men opposed to the Seward-Weed faction. It soon became known in Washington that General Taylor had strong inclinations to vanity, especially with regard to his Mexican war record. Thurlow Weed turned up at Mr. Sage's house in Troy one evening and told him he wanted him to go to Philadelphia and see Senator Seward. Mr. Weed had arranged to have Senator Seward meet Mr. Sage there before starting on his journey, and Mr. Weed outlined to Mr. Sage just what the trouble was, and told him that after consulting with Senator Seward, he must go on to Washington and disabuse President Taylor's mind regarding the Senator's attitude toward the administration. Mr. Sage protested that he did not know the President. He knew Reverdy Johnson, the Attorney-General, but that could not help Mr. Seward. Mr. Seward had but two friends in the Cabinet, Jacob Collamer, of Vermont, Postmaster-General, and Thomas Ewing, of Ohio, Secretary of the Interior; but they could not satisfactorily combat the statements of the Toombs-Stephens contingent against Mr. Seward. Mr. Sage met Senator Seward in Philadelphia, and got his instructions. They were simply to the effect that he must go to the President and tell him that he had known Senator Seward, and that any stories to the effect that he was opposed to the President's administration were untrue. Mr. Sage started on his journey, wondering what influence he, a perfect stranger, could have with the President. He thought it a fool's errand. With Reverdy Johnson he went to the White House, and was introduced to the old warrior. He told of his long acquaintance with Senator Seward, and protested that the stories of the Southern faction did his friend great injustice. The President treated him with the utmost affability, and said that he would look into the matter. The following day the nominations of the postmasters and other Federal officials antagonistic to the Seward-Weed combination were withdrawn. Mr. Sage was overjoyed at his success, but was still in the dark. On his return to Troy Mr. Weed explained the cause of Mr. Sage's success. General Taylor read almost every line that was printed about him in the newspapers, and Mr. Weed had learned that he was immensely tickled at Mr. Sage's defence of him as the hero of Buena Vista on the old North River steam-boat. General Taylor, in fact, frequently spoke of Mr. Sage's patriotism in making such a speech. And to-day, if anybody wants to know what a politician or a statesman is, Mr. Sage will refer him to Thurlow Weed, a man who could use the vanities of others to his own advantage.

But on this memorable occasion in Mr. Sage's life it is just possible that General Taylor recalled his course at the Philadelphia Convention. Mr. Sage went to that Convention enthusiastic for Henry Clay. He was supported by twenty-eight delegates from the State, not one of whom was prepared to accept General Taylor as a full-fledged Whig. On the night before the nomination Mr. Sage was invited to meet General Taylor's brother, on that occasion the guest of Josiah Randall, the father of the Hon. Samuel J. Randall. The President's brother, with the aid of Mr. Randall, convinced Mr. Sage that General Taylor was a Whig, and on the following

In the Convention Mr. Sage cast the vote of the twenty-t delegates for the old hero.

sides being a delegate to the Convention which nom-d General Taylor, Mr. Russell Sage was also a delegate ie Chicago Convention at which Abraham Lincoln was inated. He was also a delegate to many State conven- in his day. In 1856 he retired from Congress, refusing mination because of the vast strides in his business en-ises, and for seven years he devoted himself exclusively em. He assisted in the reorganization of the old La e road into the Milwaukee and St. Paul, and subse-tly became its President. When Alexander Mitchell in as President, Mr. Sage took the place of Vice-Presi- and retained it for twelve years. When the civil war at its height he retired from the grocery business, and up his residence in New York. He bought the house irty-ninth Street and Fifth Avenue for $32,500, and in six months sold it for $55,000, and moved to his present residence, 506 Fifth Avenue. He was interested in the affairs of the Wabash and the Union Pacific, and he and Mr. Gould then began a friendship which has been without a break up to this hour. Mr. Sage's first office in New York was at 25 William Street, where, as Vice-President of the Milwaukee and St. Paul, he remained for a dozen years. He then leased a floor at 78 and 80 Broadway, and sublet an office to Mr. Gould. By that time Mr. Gould had retired as special partner in the firm of Gould, Martin, & Co., and William Belden & Co., and, with Mr. Sage, was intensely interested in the affairs of the Union Pacific. Mr. Sage remained in those quarters for three years, and then removed to 71 Broadway, whither Mr. Gould followed him.

Mr. Sage at his desk looks down into Trinity Church yard upon the graves of Alexander Hamilton, Charlotte Temple, and scores who occupy niches in our Walhalla. In a year or so after taking that historic head-quarters, Mr. Gould moved up into the Western Union Building, and so he and Mr. Sage parted, as far as their offices were concerned, but the latter would count the day lost if he did not spend an hour with Mr. Gould at the luncheon provided by the directors of the Western Union Telegraph Company. He and Mr. Gould have pews in the church in Forty-second Street over which the Rev. John R. Paxton presides. Mr. Sage is a great lover of horses; and morning and evening, before and after business, he is seen spinning through the Park. He has never used tobacco in any form; but since the great panic in Wall Street in 1884 he has taken a spoonful of whiskey every night before retiring, and this is the limit of alcoholic stimulant indulged in by him. There are no holidays in this busy man's life. In the warm season he runs down after business to his cottage at Cedarhurst, to return the next morning; but winter and summer he is at his desk every day.

TWO NOTABLE ADDITIONS TO THE PUBLIC ARCHITECTURE OF BOSTON.—Drawn by Hughson Hawley.

the same ground. To this store were carted from all incoming ships selected portions of imported merchandise—cases, bales, or other packages—there to be opened and examined by the appraisers for the verification of the invoices. If a merchant imported twenty cases of dry goods, the inspector sent two or three taken at random to the public store for examination, and they were examined by men supposed to have special knowledge. If the contents of these agreed in value and otherwise with the invoices, it was assumed that all were the same, and the whole importation was released upon payment of the duty. It would be dangerous to smuggle goods not on the invoice into any one case of twenty; for as the cases to be examined were taken at random, the chance would always be open against the owner that the inspector might take that case.

In those days there was no improved machinery in use for handling goods. Enormous cases and great bales marked A T S, and with other more or less hieroglyphical signs, were landed from carts upon the small wheeled iron trucks, or moved to under the hoistway, there slung and raised to the second, third, or fourth loft, to the department of one or another examiner. Two men worked at the rope on every floor, and thus eight votes were supposed to be provided for. Perhaps a donkey-engine would have cost less, but it would not have been so useful at the polls. Zastrowski was at first one of the gallant fellows who pulled at the hoistway rope. On each loft were divisions in which cases were wheeled and opened for minute examination by the appraisers. Zastrowski soon shifted to his proper level in one of these places; and, oddly enough, he picked out the place for himself by the process of making himself useful at that point.

He had begun to study the store as soon as he got in. He was the only Pole there, but there were many Germans. He made the acquaintance of these, and went to see them in their several rooms when there was not much work on hand. This happened very often. There was many and many an idle day there, and on one of the lofts the boys used to play hand-ball for half a day at a time. In pushing his investigations into the various departments, Zastrowski found one where the goods examined were of the

the two parts together, replace the contents in its place, and nail up the box with an air of profound depression and discouragement.

Zastrowski began to believe that life was a grand swindle; that the deceptions and delusions of experience so overwhelmed all the delights and satisfactions that the man who would not prefer never to have lived must be an irrational creature. Yet he was prosperous. He had been a year in the store, and half the money he had earned was now in the savings-bank. His boy was so well advanced that the confectioner paid him wages. But his great aim in life seemed to fail. Christmas was not far, and the bonbon trade was lively in the Custom-house. On the 7th of December, St. Clement's Day in the Russian calendar—his name was Clement—he passed his knife once more through a bonbon; but no, not through! something stopped it. He slipped his knife along that something, and felt the quality of it, and grew pale. He was paralyzed for a few minutes, but his courage rallied. He nailed up the case without that box in it. The box was about the size of an ordinary octavo volume. He put it inside his overcoat, and carried it out of the store with him that night.

Zastrowski and his boy lived together in two rooms in an old house in Fourth Street, east of the Bowery. It had formerly been a fine house, but had fallen into the decay and degradation of tenement-house life. He was entirely himself when he got home. Paul was there. Zastrowski kissed him, and told him without emotion that this was the greatest day of their lives. The boy seemed to understand him. Then he hid the box in a cupboard, and they went out to supper. They ate and behaved themselves in all respects as usual, taking care not to vary in the least degree the regular routine of their lives. They then returned to their rooms, and Zastrowski, taking a book from a shelf, read a prayer in his native tongue. Next he carefully shut all the windows and the doors, spread a clean cloth over the table, and opened the box of bonbons. With one deft stroke of that thin knife and a peculiar twist of the blade in his hand, Zastrowski split a bonbon, and opened it, as you might a peach, without any injury to the outside edges of the chocolate. In the bonbon was a diamond, a diamond the size of the kernel of

agitation and a terrible experience. It was a very prosperous house. They sold fancy goods in Maiden Lane and diamonds in a little office in John Street. They had made an immense amount of money in a very little while by introducing fancy articles hitherto little known in this country, but what was less known than their goods was the fact that they had been for several years importing diamonds and not paying any duty. The money thus gained was alone enough to make them rich, and they had never lost a stone. Such good fortune could not last, and recent shipments of diamonds of which they had been notified had failed to arrive. In these diamonds were invested nearly all the capital of the firm. If they were lost, the firm was ruined. The diamonds were to be in three separate cases, hidden in chocolate bonbons, the boxes of which were to be indicated by peculiar secret marks. The cases had been opened at their own place, in the presence of the brothers, and the marked boxes taken into their private office. They had opened the first box, and to their amazement found no diamonds. Ready to believe there was some mistake in the marks, they had opened every box of bonbons in the case, and found not a single diamond. Eager to seize upon any explanation that gave a hopeful interpretation of this apparently terrible fact, they had concluded that some good reason had prevented the shipment of the diamonds in this case, and that all would be in the next. But it proved that none were in the next, nor in the third. Had they been robbed? or had their cousin in Paris, warned of some danger, failed to send the stones? If he had, they would hear from him soon; and in the mean time they wrote in the most feeling terms about the alarm he had caused them. As the Atlantic cable did not exist then, and even the ocean greyhounds had not been imagined, they had to wait through many days of painful wonder and apprehension.

During these days of waiting the younger brother went over the bonbons again very carefully, and made the discovery that in the properly marked boxes, where the diamonds should have been, every bonbon had been cut open and put together again. He also believed that in the creamy contents of the bonbons there were two different mixtures,

should know who had the diamonds.

He returned to the jeweller to whom he had sold the four small rose-diamonds, and sold him four more of the same quality, size, and cut. The jeweller bought them; and then as Zastrowski went out he put his shop in charge of another person, and followed the vender to his home in Fourth Street, found that he lived there, and in what part of the house. All this he communicated to the younger Schlossenstein. He in turn watched the house until he identified Zastrowski from the jeweller's description, and followed him early one morning to the public store. He then began to perceive how the robbery had been possible.

He related all this to his brother, and his description of Zastrowski deeply interested the brother, who wanted to see this man. The brother placed him where they could see their foe as he passed in the street unseen by him.

The elder brother, when he saw him, only said, "Zastrowski!" He knew him.

IV.

Zastrowski had two boys, and his love for them was the whole of his life. His elder boy was now in an Austrian prison, condemned as a convict for a term of years, and for this awful calamity Zastrowski held the elder Schlossenstein responsible. His boy had been in the service of Schlossenstein, and Schlossenstein had cheated the Custom-house in Austria somewhat as he had done in the United States. But he had been caught and hunted up. He had, however, so ingeniously contrived the invoices and other papers that young Zastrowski had appeared to be the importer, and therefore the culpable party; and as courts enforce the law and not abstract justice, it turned out that the really innocent boy had gone to prison for the crime of his employer. Schlossenstein had the profit of the roguery, and young Zastrowski paid the penalty. But the case laid up a terrible score against Schlossenstein in the fierce and revengeful nature of old Zastrowski.

His boy had, however, been deeply enough involved in Schlossenstein's schemes to know all about them, and when he was in prison he told all this to his father. He told him all about the plan of putting diamonds in bonbons, told him the secret marks that answer was that if they could do that, so also could he—with the same diamonds.

Then they began to fear that he would slip away on that errand before they could accomplish anything, and that the diamonds would go with him. As they left him late that night there was murder in the mind of the elder Schlossenstein, and he spoke it to his brother; but the brother, who had now for the first time heard the whole story of Zastrowski's son, did not sympathize with the thought, and he said: "This man is perhaps the only living person who knows where the diamonds are. He can be easily killed, but to kill him would destroy the clew to the diamonds."

V.

Several weeks passed and no progress was made, but the Schlossensteins kept a watch upon Zastrowski, who went regularly every day to his labor. The man they employed in this service having observed that Zastrowski and the boy were away every day all day long, proposed to get in and try and find in their rooms some trace of the property, not knowing himself just what property it was, for they did not trust him. But the proposition seemed a good one, and was acted upon; and this man got false keys, and the three spent two hours in the rooms one day, and ransacked them from top to bottom, but found nothing. They did not even find the diamonds that were not in the wall, for Zastrowski carried them with him. This failure gave to the elder Schlossenstein the notion that Zastrowski carried all the diamonds with him, and revived in his thoughts the idea of murder; but the younger brother restrained all these thoughts. He was in fact in control, because the awful loss had in some degree disturbed the reason of the elder brother. Even the younger, however, thought much on the fact of Zastrowski having, perhaps, all that treasure on his person.

An important consequence of the visit to Zastrowski's rooms was that Zastrowski got acquainted with the detective who was watching him, for some of the occupants of neighboring rooms who had seen the detective on that occasion, and subsequently saw him on the street, pointed him out to Zastrowski, and as it was part of the detective's scheme to get in with his subject and pump him, they easily came together, and got on very good terms. But the advantage of this move was with Zastrowski, for he understood the detective, and the detective did not understand him; and the detective, moreover, did not know that Zastrowski knew him. The pumping process was a great success, for one day Zastrowski asked the detective if he knew anything about diamonds. Naturally the detective knew all about them. If there was a subject in the world with which he was thoroughly acquainted, it was diamonds. Could he sell some diamonds for Zastrowski? He could and would.

At this time Zastrowski was giving a great deal of attention to the movements of steamships, and to the times and hours of their departures; but he did not mention this to his new friend. He met him the next night in a handy beer shop, and put into his hand five little rose diamonds just like those he had sold to the jeweller. The next night the detective reported to him that he had sold them for $40 a piece, and wanted to know if he had any more. Zastrowski told him he could get plenty more. Thereupon the detective paid him $200, and Zastrowski was happy because he knew that the detective had by this transaction pocketed at least $200, and hoped to keep up the game. He wanted to put more diamonds into the detective's hand the next night, but late at night. The man was willing, but mentioned that it would be more convenient to him in the daytime. He had business in that part of the town all day, and had a side partner who came in the night, so that he did not want to be seen around there at night. This satisfied Zastrowski that he had made the sale on his own account, and had not taken the diamonds to the Schlossensteins, and was afraid that the man who watched at night would find him out.

So it was arranged that he should meet Zastrowski the next day but one in the street at seven in the morning as Zastrowski went to the public store, and give him ten diamonds of the same kind to sell at the same price. There were plenty, but he could not get more than ten at a time.

Zastrowski was very busy that morning. He took all the diamonds out of the beam as early as five o'clock, sewed them in a bag, and put the bag in his boy's pocket. Then they had their coffee as usual, and were ready to go out at the usual time; but there was a little change in the programme. The boy was to go to a certain corner and wait for his father. If his father did not come in an hour, he was to go to his shop, and in the yard behind the shop bury that bag somewhere in the ground, for that back yard was an old fashioned garden.

Zastrowski met the detective that morning in the Bowery, gave him the diamonds, and agreed to meet him and get the money that night in the same beer shop. The detective got on a Fourth Avenue car and rode away down town; and Zastrowski followed in the same direction until he was thirsty and stopped to have a glass of beer. Out of the beer shop he went on another street, and joined his boy at the corner agreed upon. Thence they went to Thirtieth Street, took tickets for Montreal, and three days later were safe on a Quebec steamer going down the Gulf of St. Lawrence.

Zastrowski sold his diamonds in Paris, and was a very rich man. His first act thereafter was to fee a good lawyer in Vienna, who found in the case against Basil Zastrowski no end of flaws, and who consequently soon obtained the liberation of that young man. In about a year the diamond finder purchased for himself the title of baron, dropped the name of Zastrowski, and when I saw him in Paris seven years since, he was pointed out as a man of financial genius, who had gone to America poor, and made an enormous fortune in little more than a year.

BLOODROOT.

Flaky white or faintly tinted lavender,
With leaflets rich in shining orange veins,
Beside the pasture wall you shyly lift
Your fragile petals in the scented air.

When Martius blows his trumpet loud and shrill
You dot the rippling grasses daintily,
And smile through April's tears, and disappear
Only when May has flowered all the land.

Sweet fate to live a perfect rounded life,
Like the pale bloodroot by the crannied wall,
All in a green and gold companionship,
Knowing no season but the shy spring!

R. K. Munkittrick.

THE NEW BOSTON COURT-HOUSE.

Among the many public improvements going forward in Boston under the auspices of the State, county, and municipal authorities, one of the most important is the new Court-house, now approaching completion. This edifice is intended to replace the gloomy granite structure in Court Square, which, since the year 1836, has served the various purposes of a seat of justice of Suffolk County. In its natural features the site of the new Court-house is admirably chosen. The ground slopes from its base on three sides, and upon the fourth a gentle ascent leads to the State-house, which, two blocks away, crowns Beacon Hill. The new building stands upon the easterly slope of the hill; two of its sides are bounded by Pemberton Square, a third by Somerset Street, and the rear of the building ends far down the slope to the north, where it abuts against a block of dwelling-houses upon Somerset Street. The material used in construction is granite from quarries in Maine and Massachusetts, except that a portion of the rear building, fronting on Somerset Street, comprising the part that is to be occupied by the city prison and criminal courts, is of faced brick trimmed with granite.

The new structure is massive but symmetrical in its proportions. The style of architecture is of the German renaissance. This mode of planning buildings that are to cover large areas is new in America. It originated about a hundred years ago in Europe, and is steadily increasing in favor, it being the style of the Palace of Justice in Paris, and of the more recently constructed buildings in Vienna and Brussels. The Hôtel de Ville, Paris, which was begun in 1770 and completed in 1858, is the first conspicuous example of the court-yard system of construction in Europe. Destroyed by the Commune in 1871, it was rebuilt on the same model, it being insisted upon by the French authorities that the original design be maintained as nearly as possible. The characteristic feature of this school of architecture is the succession of central courts, which admit abundance of light and ventilation to every part of the largest structure. In the building here described as being in the process of erection in Boston, four great courts, with an aggregate area of 14,632 feet, are required to fulfil this purpose. The area covered by the court building, including the inner open areas for light and air, is 79,988 feet. The outside open area, exclusive of the adjacent street and square, is 5750 feet—making the total area of the site 85,738 feet. The building proper is 85 feet in height, and the top of the dome is 250 feet above Pemberton Square. The length of the edifice is 450 feet, and its greatest width 190 feet. The construction of this Court-house was begun under the authority of an act of the Legislature passed in 1885, the work being placed under the direction of a board of three Commissioners, Messrs. Solomon B. Stebbins, Thomas J. Whidden, and Godfrey Morse, appointed by the Mayor of Boston. A competition was entered into among the architects of the county, and about thirty responded. The examination of the plans submitted resulted in the selection of the designs prepared by Mr. George A. Clough, an architect of Boston, under whose direction the building is now being erected.

The corner-stone was laid on June 6th, 1887, and the probable time of the completion of the edifice is 1892. Its total estimated cost is $2,500,000. The building contains most ample and convenient accommodations for the Supreme Judicial Court of the Commonwealth, of the Superior Civil Court and Criminal Court, of the Municipal Criminal and Civil Courts, of the Probate Court and Registry, and of the Juvenile Court and Inquests. The sheriff's and similar offices are located on the ground-floor, adjacent to the main entrance. All entrances for judges and jury are in the rear of the building.

RECENT ENGLISH CAUSES CÉLÈBRES.

Mr. Montagu Williams as a criminal lawyer has a reputation not limited to England. Those peculiar cases known as *causes célèbres* attract universal attention, and as the name of Mr. Montagu Williams has been so often attached to them as representing the defence, the ways of the English criminal lawyer have been fairly well understood.

Starting with the well known axiom that every man is innocent until proven guilty, Mr. Montagu Williams, in his *Leaves of a Life*, shows what are the methods by which "an intelligent jury" may be made by dint of talk to see sometimes what is really black as white, or if not white, gray, and so the dark cloud of suspicion having been removed, a halo of light (more or less theatrically obtained) may be cast on the man arraigned at the bar. There can be no question that errors are sometimes committed—man is but fallible—but still in the careful reading of Mr. Montagu Williams's experiences—and he states that "he has defended more prisoners than any living man," his practice extending from 1862 to 1886—we do not find a single case of a grave character, where the life of an individual being at stake, there had been miscarriage of justice. English courts are chary of exercising their dread powers. If there is the least uncertainty, the man charged with capital crime does not suffer death. If imprisonment be a mitigation of punishment, he has the milder sentence of confinement for life. Differing from us in one respect, our ideas of mercy being quite as keen as those of Englishmen, the pardoning power is more curtailed in England. Another point in favor of the general English public is the absence of that false sympathy which makes an idol of a convicted murderer.

Mr. Montagu Williams seems to have had many advantages on his father's side; he came from a family who followed the bar. Having been well educated, recalling in his book his school life at Eton, at the beginning of his career he entered a militia regiment, and in time obtained a regular appointment in the army at the close of the Crimean war. Leaving the service, he became an actor, having, when in garrison towns, tried theatricals as an amateur. He mentions engagements at Manchester, Edinburgh, and Glasgow. While on the boards he married Miss Keeley, the daughter of a well-known actor. Finding difficulty in making a living, Mr. Williams then took to writing farces, made a translation of a French play, and was moderately successful. He also tried his hand at periodical literature. These diversities of calling were useful to the future criminal lawyer. He became intimate with many rising men in art and journalism, and the cultivation of his theatrical tastes gave him that power of elocution which becomes of no small service at the bar.

With sharpened wits, having tried a good many things, it was at his father-in-law's suggestion that Mr. Williams sought Sergeant Parry for advice, and became a law pupil. Perhaps without that mental power necessary to master the profounder problems of jurisprudence, Mr. Williams's natural inclination went toward criminal business. He tells us that in lieu of "poring over pleas and dry opinions," it was his habit to repair "to the Central Criminal Court, otherwise known as Old Bailey," where he would sit listening intently to the trials. In 1862, the future Q.C.'s time of apprenticeship being up, he hung about the courts, doing nothing for a session or two. His first case was to defend a man for horse stealing; and Mr. Williams tells of his stage-fright and how confused he was, so much so that when the case was concluded he hurried home to his wife and said: "My dear, I shall never go to court again. I've mistaken my profession. I must try something else." But it was not long before he found his way back to the Old Bailey.

The first important business was his defence of Catherine Wilson, charged with administering an ounce of sulphuric acid to Sarah Cornell. Catherine was a second Brinvilliers. Her occupation being that of a nurse, it was her habit to wheedle her patients into making her some legacy, and then to poison them. The evidence that Catherine Wilson did administer sulphuric acid to Sarah Cornell was absolute. The bed-clothes had holes burnt into them by the corrosive liquid. What Mr. Williams was to try and show was that Sarah Cornell died because a slight blunder had been made by the nurse, or if not an error on her part, it was a mistake by the apothecary. The judge, Baron Bramwell, pointed out that the defence was untenable, and the jury (there being no accounting for juries) thought just the opposite, and "not guilty" was the verdict, and then, perhaps, Mr. Williams's reputation was made. Was the prisoner free? Yes, but only for an instant. Before she left the dock she was arrested on another charge of murder—that of Maria Soames. This time it was only an overdose of colchicum that had hastened a patient's departure. It really was hard that the criminal lawyer who had cleared Catherine of poisoning with such a visible substance in its effects as sulphuric acid, should have found any trouble with a much less positive material like colchicum. Mr. Williams of course relied upon the well-known difficulties of detecting a vegetable poison in the blood after a short lapse of time. Maybe the sweet Kate would have gone forth again to try her gentle art of getting away with her patients by means of other drugs, but the judge said this in his summing up: "Gentlemen, if such a state of things were allowed to exist, no person could sit down to a meal in safety." "Think," observes Mr. Montagu Williams, and rather comically—"think of this, too, when the jury were about to take their luncheon!" Then came what was a just decision, a verdict of "guilty," and it is hoped that Catherine suffered the due penalty of her crimes. After the verdict the judge complimented the lawyer on his skill, in the proper professional manner, but added, "if it will be any satisfaction to you, I may tell you that in my opinion you have to-day defended the greatest criminal that ever lived."

Another case where the peculiar talent of Mr. Montagu Williams was displayed was in his defence of a man accused of murdering a woman who was the landlady of a small wayside inn. The corpse was found in a pool of blood, the head literally severed from the body. The drawers, the cash-box, and the till had been rifled. The terrible part of it was that the accused had received the utmost kindness from the widow when he came to her starving some time before. He had become her manager, and Mr. Williams, with just pride (professional, of course), adds that circumstances pointed to the manager as the author of the outrage. The cleverness of the criminal lawyer was such that he convinced an intelligent jury that the manager was innocent, and the client was acquitted. "That same night, after drinking heavily, he (my client) passed down the High Street of the town, and holding out his right hand, exclaimed, 'My counsel got me off, but this is the hand that did the deed.'" Continues the author: "A man cannot be tried twice for the same offence, and to my perpetual regret this ruffian remained at large."

The author has some amusing stories about

the Percy Mapleton *alias* Lefroy murder, of 1881, is of such recent date as to have been well known in the United States. In the appendix may be found the full text of the address to the jury. Another case in which the author, Williams, figured was the defence of George Henry Lamson. This man, who was a doctor, in order to obtain certain legacies had undoubtedly taken two lives. In the latter case the skill of the lawyer depended on bamboozling the experts, who had to determine the character of the poison. It was evident that Lamson, besides being a toxicologist of merit, was also a prestidigitator of no small skill. He did the business really more cleverly than a Wilkie Collins could have written it. Despite the lawyer's talents both Lefroy and Lamson went to the gallows as they deserved. The Turf Swindles, the case of Madame Rachel—the woman who enamelled other women—the Dobbs murder, and many other criminal suits were managed by Mr. Montagu Williams.

"My collie's name was Rob." That serves as an introduction to the author's own particular dog story. Rob was stolen by a gang known as the "Forty Thieves." Do what he might, the criminal lawyer had to compound with felony, and it cost him twenty pounds to get back his "dawg." When paying over the money, Rob's master modestly remarked that, knowing who he was, he thought it rather too bad of them to steal his dog. Why, we don't know.

"Ah, that's the best of it," said one of the thieves. "Lord, sir! you should have seen how my pal Bill her did laugh. 'Ain't it rather hard,' says I, 'to take the counsellor's dawg?' 'Not a bit, Jim,' says he. 'He's had a good lot out of us, and why shouldn't we get a little out of him?'"

But the criminal lawyer, when he got back Rob, harbored revenge, and his turn came in time. In England the penalty for dog-stealing, even after previous convictions, is eighteen months' hard labor, a dog not being a chattel. One of the "Forty Thieves" stole another dog, and there was a collar on that dog. In court Mr. Montagu Williams recognized at a glance his Shoreditch friend. The proof that the dog was stolen was evident, and the jury returned a verdict of guilty; but that was not all, for the lawyer expressed his intention of trying the prisoner for the theft of the collar; and that, if proven, was felony. To the eighteen months for the dog another twelvemonth was added to the term of confinement, to run consecutively. That sentence staggered the prisoner. "He put his hand up to his head, and looking very hard at me, muttered, as he was hurried off to the cells: 'Thought he'd have me some day. He's made me pay d——d dear at last for those pieces.'"

NATIONAL BANK CURRENCY.

When the national bank system was ought into existence twenty-seven years o, it was regarded chiefly as a means of nishing a steady market for a large amount government bonds. It answered that extation fully. Later, as the market for ernment bonds became larger and more ural, so that a special class of buyers for was no longer needed, the workings of system had approved themselves to the people in all parts of the country, and the number of national banks continued to increase. The uniform value secured for national bank-notes saved money everywhere in the domestic exchanges, and the protection given to depositors by the strict requirements of the law was more and more appreciated. The popularity of the system appears to be still spreading, if not actually increasing, and new applications for charters under the national bank act are received almost daily by the Comptroller of the Currency. The fact that bank circulation has been voluntarily surrendered to a very large extent has not diminished the desire to organize banks under this law, and even in cases where established banks have left the national system to return to State control, the reasons for the change appear to be exceptional and not general. That there are some difficulties to be contended with, felt more in the reserve cities than elsewhere, cannot be denied. The changes in the price of government bonds and the lending value of money account for most of them. Circulation has been surrendered, we are told, because it ceased to be profitable. A more direct statement of the case would be because the advance in price made it profitable to sell the bonds by which the notes were secured.

The large reduction in bank circulation during the past few years has made many people uneasy about the continuance of the national system. Bonds have been reduced rapidly in amount; the Treasury has bought and cancelled, from August 3, 1887, to March 15, 1890, no less than two hundred and sixty-one millions of United States bonds, at a cost of $306,556,991. This evidence of frightful overtaxation has had the effect of alarming some people as to the future basis of national bank-notes; and no wonder, if such a surplus revenue is to be continued. Neglecting, therefore, the probabilities of a reform which shall cut down the revenues to a suitable amount, some observers have devoted considerable thought to devising a plan for the issue of national bank-notes in which government bonds may be greatly economized. Mr. John Jay Knox, formerly Comptroller of the Currency, but now President of the National Bank of the Republic, New York city, is the author of a plan of this kind, which was introduced as a bill in the House of Representatives of January 16, 1890, by Mr. Dorsey, of Nebraska, chairman of the Committee on Banking and Currency.

Mr. Knox proposes that the circulation of a national bank, instead of being wholly based upon government bonds, and limited to 90 per cent. of the par value of the bonds, shall be divided as follows, viz.: 35 per cent. of the notes to be secured by bonds, but issued to the par value of the bonds; another 35 per cent. secured either by bonds in the same manner, or by gold coin or bullion, or by silver bullion at its market price, and in either case to the full value; and the remaining 30 per cent. to be secured not by a specific pledge, but by a newly devised Safety Fund.

This Safety Fund is to be started with a donation of a million dollars taken from the existing redemption fund, and to be increased by the duty now levied on national bank-notes, which is 1 per cent. per annum. Judging from the small amount of notes of banks which have hitherto failed, the calculation is offered that this Safety Fund would prove as effective as a deposit of bonds. And with this free portion—30 per cent. of the notes—it is calculated that national banks would find a profit of 1¼ per cent. in taking out circulation on this plan, even with 4 per cent. bonds at 126 as the basis of 35 per cent. of it. The calculation, it may be added, is considered by some bankers as too favorable in underestimating the expenses.

The metallic reserve, permitted in this scheme for 35 per cent. of the circulation, is evidently expected to be silver bullion at market price, and provision is made for the case of a decline in price.

The scheme, as a whole, would largely reduce the amount of bonds required; at present it takes $10,000 of bonds to secure $9000 bank-notes, where $3150 of bonds would meet the requirements of the scheme, supplemented by $3150 in metal, and $2700 of Safety Fund. But it is doubtful if the people are ready to exchange the present simple rule—notes secured by bonds with good margin—for so complicated a system. It would take some time to persuade them of the equal merits of the Safety Fund. They would object, and properly, to the deposit of gold as security; all the gold available is wanted, under our system, as reserve against deposits. But the proposal to utilize silver in this manner will probably satisfy no one. Certainly it will be regarded by the so-called "silver men" as a device to head them off; while people who are afraid of the steady increase of silver coinage will be likely to prefer Mr. Windom's more adequate and direct plans for meeting the silver problem. Ingenious as the whole scheme is, and plausible if a new system had to be built up from the foundations, if a bank currency had yet to be created, it still seems academic rather than practical. The reduction in national bank circulation, large as it is, has been unfelt; the silver notes have more than filled the gap. The only money whose withdrawal hurts us is the money of full legal tender locked up in the Treasury to redeem surrendered bank-notes, now amounting to $68,000,000. This is the money that is painfully needed; there is plenty of money which is not of legal tender afloat at the present time. And there seems to be better grounds now for expecting a good supply of bonds on which to base circulation than for some years past. A reduction in the revenue is now probable, with resulting diminution in the Treasury purchases of bonds. The 4½ per cents. mature next year, and it is to be supposed that part of them will be renewed at a lower rate. The 4 per cents. will be cheaper if the Treasury cannot buy them freely; they are already 3 per cent. lower than they were in January. And even if things remained as they are, in respect of the price and supply of bonds, the people would probably prefer the security they are accustomed to, though they might be persuaded to allow the issue of notes to the par value of the bonds and to take off the unnecessary tax of 1 per cent. per annum on bank circulation.

Henry J. Macdonald.

New York, *Thursday evening, March 20, 1890.*

DON'T GO OFF BEFORE YOU ARE READY, Particularly on a long journey. Be fully prepared. You cannot be, permit us to say, unless you are accompanied with the traveller's and tourist's *vade mecum*, Hostetter's Stomach Bitters, most genial of appetizers, acclimatizers, and promoters of digestion. Against sea-sickness, malaria, cramps, and colics, begotten of badly cooked or unwholesome food and brackish water, nervousness, increased by travel, chronic biliousness and constipation, the Bitters is a sovereign preventive. It imparts a relish for food not altogether to your taste, and prevents it from disagreeing with you. Never was there such a capital thing for the unfortunate dyspeptic who stands in dread of the best-cooked meal. Stomachic trouble caused by ill-prepared viands aboard ship, on steamboats, and rations hastily bolted at railway restaurants, is soon remedied by the Bitters, which gives a quietus also to rheumatism, kidney troubles, and insomnia.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

BROWN'S BRONCHIAL TROCHES Contain ingredients which act specially on the organs of the voice. They have an extraordinary efficacy in all affections of the Throat, caused by cold or over-exertion of the voice. They are recommended to Singers and Public Speakers, and all who, at any time, have a cough or trouble with the throat or lungs.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA, "THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Nicholson's Liquid Bread is the tonic *par excellence* for dyspepsia, ailments of the respiratory organs, wasting and nervous maladies, &c., &c. Give it a trial. Your grocer or druggist keeps it.—[*Adv.*]

The fashionable ladies' corrective tonic is Angostura Bitters, the world-renowned tonic.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER. Whitens the teeth and purifies the breath. 25c. [*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

For purifying the blood, stimulating the appetite, and invigorating the system in the Spring and early Summer, Ayer's Sarsaparilla is unsurpassed. Be sure you get Ayer's Sarsaparilla and no other; else the result may be anything but satisfactory.—[*Adv.*]

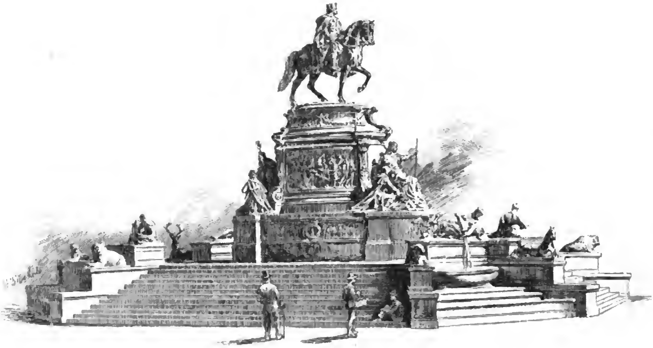
HARPER & BROTHERS, New York.



THE WASHINGTON MONUMENT TO BE ERECTED AT THE GREEN STREET ENTRANCE TO FAIRMOUNT PARK, PHILADELPHIA.

THREE NOTABLE MONUMENTS.

AN ORNAMENT OF FAIRMOUNT PARK

THE Pennsylvania Society of the Cincinnati decided many years ago to erect a monument to the Father of his Country. A fund was raised and trustees appointed, of whom Mr. Richard Dale is chairman, and the commission was awarded to Professor Leopold Rudolf Siemering, of Germany. As far back as 1879 there was dissension in the society concerning the place where it was to stand, some persons advocating Washington, D.C., others New York city; but meantime the fund increased, and now the monument is certainly destined for Fairmount Park, Philadelphia. It will occupy the chief place of honor at the Green Street entrance to the Park; a width of 200 feet will be guaranteed for its proper setting off, with 80 feet clear on each side of the monument, and the Park Commissioners have promised to expend $20 000 on the embellishing of the surroundings.

Professor Siemering has at last finished the monument, which consists of a large equestrian Washington, in bronze, on an elevated pedestal, two bronze groups of three or more figures against that central body, bass reliefs on two sides, four recumbent figures on low pedestals upon the platform, and eight large animals couchant on projections level with the platform between the eight stairways of approach. About a score of figures, therefore, decorate this grandiose memorial to George Washington. As a whole, it will surpass in elaborateness and in cost any memorial, other than a building, which Philadelphia can show. The citizens will no longer approach their pleasure-ground by a mean entrance, but along a wide avenue graced by portals and by this monument, whose cost alone will doubtless stand for much in the estimate made of it. The sum of $400,000 is said to have been paid for Siemering's Washington.

That sculptor is hardly known in America, but he has had a career in Germany. Born at Königsberg in 1835, he studied in Berlin with Bläser, and in 1860 made a mark with a statue of Penelope. He executed the seated marble statue of King William in the Berlin Stock Exchange and the War Monument at Leipsic. He began with portraits in relief, and has made his best mark in that line, particularly through reliefs shown in 1871, when the people of Berlin welcomed the return of victorious armies; reliefs that represent the popular uprising in favor of the war the year before. For Cassel he made, in 1878, groups in bronze of soldiers going to and returning from the war, and for Marienburg, in 1877, a monument to Frederick the Great, with Frederick on horseback, and four subordinate warriors about the pedestal. In 1872 he took the second prize for a Soldiers' Monument in Hamburg, and competed for the Goethe Monument in Berlin. That city has a memorial by Siemering, to commemorate the oculist Gräfe, in the grounds of one of the hospitals, which is said to have some originality. It is evident that the professor does not belong to those prophets who lack honor in their own country.

Approaching the Washington monument, one notes at first the equestrian statue dominating the whole. The horse is much the same in movement as that of H. K. Brown's Washington in Union Square, New York. The rider wears a three cornered hat and an ample military cloak, which adds picturesqueness and mass to the figure. He reins the horse's head in pretty sharply, and looks away with the gesture of the head of a commander surveying troops on the march to positions. Next one sees the animals lying down as guards of the eight stairways. They include the grizzly bear, panther, American stag, buffalo, horse, ox, and so forth. The four recumbent figures, male and female, come next. They occupy a higher plane than the animals, being raised above the platform's level by low couches which act as pedestals, and their office is to preside over broad basins at the top of the small stairways into which they empty water. Thus the idea of a fountain is introduced into the lower tier of the monument. A nearer view opens up the bronze groups at the narrow sides of the oblong square pedestal for the equestrian statue. They are symbolical groups referring to America and the struggle for liberty. Ascending the broadest stairs on the sides of the monument, the wider sides of the pedestal contain reliefs giving incidents of the Revolution, while the plinth spaces, which have wreaths in their centres, carry inscriptions. The corners of the pedestal are cut off, and these, together with the cornices and the spaces that narrow upward to the roof on which the horse stands, are enriched with mouldings and decorative work of various kinds.

Professor Siemering has been a long while at work on this monument, at least eight years, and probably much longer than that, if one counts back to the original sketch which gained the approval of the Pennsylvania Society of the Cincinnati—a society which, when formed after the Revolution, aroused a good deal of unfavorable comment, because the Americans of that day suspected that it might grow into an aristocratic body, which would renew distinctions of rank, and some day exert an influence prejudicial to government by the people, has proved in time anything but a foe to republican ideas. After the rebellion it was imitated by the Legion of Honor, which so far has not done great harm. Philadelphia is peculiarly a city where a certain reverence for birth and family has lingered, and it is fit enough that the local branch of the Cincinnati should honor Washington in this way, for the society was formed largely to support the first President, and its members are, or are meant to be, descendants of those who fought under him for liberty. And though Philadelphia contained a body of ill-wishers to the United States even larger than New York, it must never be forgotten what sacrifices were made by many of her citizens in the cause of the people. The Sons of St. Patrick helped Washington over many a hard bit of road financially, just as the poorer Irish, entering by Philadelphia in that period, embarked their lives gladly in the armies of the republic.

A German sculptor, and particularly one who lives in Berlin, can hardly be expected to design a monument to Washington which shall express what Americans think of and feel for him. The Washington of Fairmount Park is not the severe and noble Washington of Union Square; neither is it the admirable expression of personality we find in Houdon's standing portrait in the rotunda of the State-house at Richmond. But considering his difficulties, Professor Siemering has done well. He has made an ornate and imposing structure, with a profusion of bronze decorative statues and reliefs, such as the Teuton loves to contemplate, between sips of beer, from his seat in a restaurant. Horse and rider are ample if not majestic, and the eye follows from one of the lower pieces to another with a certain curiosity. Fastidious people may become a little bored with the tame wild animals, whose connection with the monument is somewhat strained—somewhat difficult to understand. Probably they indicate a desire to get something American into the monument. But in the long run one wishes them somewhere else, just as one feels pain at sight of too many iron dogs and stags about the villa of a successful merchant. There is, however, every reason to suppose that the gentlemen who selected Professor Siemering's designs represent much more truly the taste of the average Pennsylvanian than do persons who turn up their noses at merchants' villas and their surrounding menageries in metal. There is good honest effort in Professor Siemering's work, and if Heaven has not made him a genius, there are few sculptors in any land who deserve that term. Refuge can always be taken, on the principle that money tells, in the price that has been paid for the Washington Monument. Think of it! Four—hundred—thousand—dollars!

THE EQUESTRIAN LEE FOR RICHMOND.

THE capital of Virginia has the best statue of George Washington in existence, made by Houdon in the last century, and a monument of some degree of merit, representing Washington on horseback, with various generals about him, designed by Thomas Crawford. But it has no monument in public to General Robert E. Lee, who occupies in the affections of the Virginians a place perhaps superior to Washington. Lee is the real hero of the Lost Cause, partly because he was a Virginian, partly because he fought a brave fight, but also for the reason that he had personal qualities which endeared him to civilians and military men in a greater measure than Jefferson Davis and Lee's fellow-generals possessed. These qualities were known and appreciated before the rebellion broke out, and became during the four years' struggle and the dignified and silent after life of the man intensified in Southern hearts to the pitch of hero-worship. Few commanders have deserved better the affection lavished on Robert E. Lee. For secession was not at all to his liking, and he only yielded to the wave of provinciality in his State, though he himself had a wider view of the situation. Whether we are to consider this yielding weak or heroic depends on the point of view. At any rate, the people of his State owe him much for bending to their will when once they had set their hearts on secession, and can hardly do less than erect a memorial to one who made their folly glorious, and became a martyr to their headstrong wills.

An equestrian statue will be raised this spring to General Lee in the city which he defended valiantly and long. Finding few sculptors of eminence in the Southern States, and disliking to ask of a Northern artist an effigy of their old commander, the commission for the statue went to Paris for a sculptor. They chose Marius Jean Antoine Mercié, a comparatively young but by no means obscure artist, who is associated with Monsieur Falguière in the monument to Lafayette, at Washington, D.C., which is to stand opposite the White House, on Lafayette Square. Monsieur Mercié is what they call in France a *méridional*, having been born at Toulouse in 1845. He studied with Geoffroy and Falguière, took a *prix de Rome* in 1868, studied in Italy the sculptors of the Renaissance, and received the Legion of Honor in 1872, with the officer's cross in 1879. His bronze statue of the young David in the Luxembourg Palace collection is often pointed out as his masterpiece. It was shown in 1872. Others call the Muse of Art on Pegasus—"Gloria Victis," 1877—the greatest of his achievements. In 1879 he showed a statue of Arago, the naturalist, full of curious and beautiful detail, and the tomb of the writer Michelet, which has been severely criticised. His seated statue of Monsieur Thiers was unveiled at Saint Germain in 1880. Mercié has given bass-reliefs to the Louvre façade, and executed very excellent statues of animals which vie with those of Mène and Frémiet, if not with the animals of Barye. He is still a young man, and in all probability will come to the United States in order to attend the unveiling of one or both of his monuments for Richmond and Washington.

The horse which Lee bestrides in Mercié's statue has all four feet to the ground, but is in the act of walking slowly. A forefoot is planted in advance, and the hind foot on the same side is about to follow suit, but has not yet entirely quitted the ground. The head is bent a little to one side, and the tail just swings clear of the flanks. The general's dress is simple to severity, a characteristic found among the commanders on both sides, who commonly avoided the trappings and pomp of war. He is girt with a sash, and wears the sword of a commander of cavalry. No epaulets appear, but the coat sleeve bears on the forearm an ornament in broad braid. He holds his hat in the right hand hanging by his side, and the reins in the left. The feet are tipped into the stirrups, and are not perfectly on a line, the right foot being slightly in advance. Calmness and determination are shown in the bearded face. He seems to be reviewing troops, and we may suppose that the moment chosen is that in which he examined the Army of Northern Virginia before pressing onward to his fate at Gettysburg.

It is unfortunate that a foreigner should be the one who designs the statue of a popular idol, but if foreigner it must be, then Mercié is a sculptor well chosen for the task. There is great repose in this statue, but of dulness or heaviness not a trace. The horse is alive, yet has the minimum of liveliess. The figure is posed easily and naturally, without that nip of the knees which horsemen talk about, but do not em- loy when moving slowly, and there is considerable distance etween foot and foot. The riding boots, sash, coat, and auntlets are modelled with ease, like habiliments of every- lay wear, and the horse's mane and tail, and the hair on the ead and beard of the rider are broadly and vigorously reated. The model which Mr. H. D. Nichols has repro- luced in pen and ink was sent by the sculptor from Paris o Richmond. Notes and suggestions were made, and it vas sent back with various clothes, trappings, and appurte- iances of the general for further development. The large nodel was completed and has been cast in bronze; an en- 'oy from the commissioners telegraphed last week from Paris that it was very satisfactory. Great are the prepara- ions for its unveiling. One suggestion is to have the statue auled to its place from the train by hand-power, which is o be supplied by the enthusiastic populace. There will ertainly be a grand reunion of Confederates in Richmond at that time, and the statue of General Lee will be installed with greatest pomp and rejoicings possible.

THE STATUE OF PRESIDENT WOOLSEY.

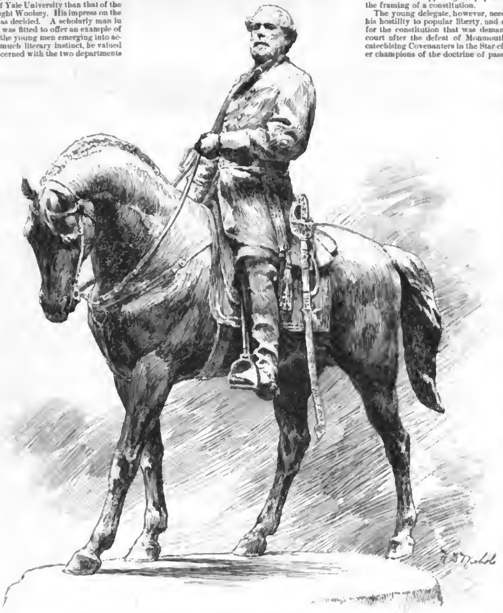
UNLESS it be one of Elihu Yale himself, no statue is more ppropriate to the campus of Yale University than that of the ate President Theodore Dwight Woolsey. His impress on the ollege for half a century was decided. A scholarly man in hought and appearance, he was fitted to offer an example of what a scholar should be to the young men emerging into ac- ive life. Without having much literary instinct, he valued literature, but was more concerned with the two departments wherein he made his nark, theology and he classical studies; and so he kept Yale lose to the traditions of her foundation by ffecting, only with he greatest circum- pection, such changes n the faculty and cur- iculum as appeared necessary. Dr. Wool- ey was, however, by no means wanting in liberality; his training and work merely pre- ented him from em- arking rashly on hanges from the ear- ier methods of in- truction without a horough considera- ion of the ground. President Noah Por- er, who followed him, egan much more im- ortant changes in the urriculum. Perhaps t may be said that he latter had what President Woolsey acked — the outside upport which began o be felt at Yale when the alumni se- ured representation n the councils of the university.

The man who gov- rned Yale for so nany years, and was nstructor from an arly age, deserves the est of monuments. He was a New-Yorker y birth, but a college nan by training, and hat in the best sense. Dr. Woolsey had a ersonal quality that nade him beloved ithout loss of re- pect. He had a vigor f character which ould shine through is eyes when some leed by graceless outhe roused the in- gnation of the just. ale graduates and ndergraduates will xpect a sculptor to o good work if the bject is President Woolsey.

The wood-cut gives fair idea of the tue modelled by rofessor John F. Weir. He is a son of r. Robert Weir, the ainter, is better own as a painter than a sculptor, and has charge of the ale Art School. The campus already possesses one onze statue modelled by him, that of the elder Professor lliman, which stands before Farnum Hall. In that monu- ent Professor Weir was not successful. The elder Silliman s an extremely courtly old gentleman, with a benevolent l handsome face, and the manners of a Chesterfield. But e bronze looks like a Western Senator of a half-century o or a squire from some remote district. A glance at the t will show, however, that Professor Weir has not fallen o error in this case. It is President Woolsey in old age, d in his official gown, leaning forward, with an intent look his firm and well formed countenance which is very char eristic.

This intentness bordered on fierceness, but did not mean 'erity. With one hand lying loose on his lap and the ht hand holding a book partly open on his knee, with s crossed in an easy fashion and the body leaning a little ward, the figure is that of Woolsey the Teacher listening ntly to a recitation. The robe falls in simple and rather d lines. The chair is a plain one with rounded back, de after a Greek pattern. It alludes to the Greek pro- orship which he held for fifteen years, and the series of ek tragedies which he edited for the use of schools. The ort sought was realism, and the object of the sculptor has been very fairly attained. It should be observed that Professor Weir, while realistic, has not been trivially so. The face is modelled in broad masses, and the hair treated without niggling. The pose is natural, easy, and not without dignity, as suited to the simple manners and inbred gentlemanliness of President Woolsey. Yale should be congratulated on a professor who can do good work in sculpture as well as painting, and on the acquisition of a monument worthy of the subject and the university.

The place for this statue is not yet fixed, but it will probably stand in the northern part of the quadrangle not far from Alumni and Durfee halls. There is room for it on the corner of Chapel and College streets, directly in front of Osborn Hall, which acts as a corner entrance to the new system of buildings. These will gradually become more regularly quadrangular as other structures are raised and the old brick row is removed. But that spot would be better fitted for a statue of Elihu Yale. It might be placed directly in front of or behind the Old Chapel to mark its site when that building has to give way with the rest of the old brick row, and also to recall the years when President Woolsey read morning prayers and preached many a fiery sermon there to unregenerate American youth. Wherever it shall stand, the statue will always recall a long life of spare living and high thinking devoted to the good of rising generations and the interests of Yale.



THE MONUMENT TO ROBERT E. LEE TO BE UNVEILED ON MAY 29 AT RICHMOND, VIRGINIA.

BISMARCK AND GERMANY.

I

THE great space which Bismarck has occupied in Germany may be measured to some degree by the conflicting character of the guesses that have been made as to his successor. The public at large, seeing no one statesman ready to carry on the work of the retiring Chancellor, were inclined to conclude that there was but one great German capable of steering the ship of state, and to indulge in some of the despondent reflections that good men entertained when Washington refused to be President a third time. The Father of his Country rightly concluded that a Constitution was not worth having that depended for its vitality upon the existence of any one man; and the German Emperor would be showing little confidence in the fruits of German culture did he despair of his government because one of his ministers saw fit to resign.

Bismarck's early years were spent after the fashion of the Tory country squire of his day, the English counterpart of which we are all familiar with in the pages of Addison's *Spectator*. The German who wishes to designate briefly a man with very little knowledge, but enormous self-conceit; of meagre income, but of vast pretensions; coarse in his manners, yet boastful of his pedigree; a hater of all popular rights, but still more savage against a government that would curtail his—this man, the type of the petty privileged country squire, is by Germans held up to contempt under the title of *Yunker*. In a community of this kind was Bismarck born, in the very year that liberty-loving Germans were sacrificing their all for a dream of united Germany, and raising the troops that were to stain with their blood the battle-grounds of Waterloo and Ligny.

At six years of age—that is, 1821—the little Tory was put to school in Berlin; in 1832 he went to the University; in 1839 he commenced to take a share in farming the paternal acres; and it is only in 1847, when he is thirty-two years of age, that we hear of him as a public character. In this critical year, just before the great popular movement that was to rear barricades in the streets of Berlin, and wring from the King the constitution that had been promised already forty years before, Bismarck came once more to the capital, this time not to play the part of the docile school child, but as a delegate of his fellow country squires, charged with the mission of opposing all popular measures, particularly the framing of a constitution.

The young delegate, however, needed no spur to animate his hostility to popular liberty, and especially his contempt for the constitution that was demanded. Jeffreys holding court after the defeat of Monmouth, or Archbishop Laud catechising Covenanters in the Star-chamber, were no stauncher champions of the doctrine of passive obedience than was the Bismarck of 1847. From his point of view, Heaven was to be thanked for sending the Prussians not only a King to sit on the throne, but above all a large and prolific aristocracy to keep the peasants in order and—fill the governmental posts. Why any loyal Prussian could desire more than his Yunker and his throne, he, for one, could not see, and the idea of introducing such a foreign thing as a constitution was, he thought, not merely opposed to the doctrine of the divine right of kings—it was far more; it was a menace to the more precious right of government by Yunkers.

That the late Chancellor maintained his side vigorously no one can doubt who has heard him in debate, but that he failed to convince the country of the justice of his position is equally true and far more gratifying. However, he succeeded in impressing the government with the important fact that in him they had an ally who was afraid of no one, and was, moreover, endowed with more vigor and acumen than all the rest of the high officials put together. Just such a man was needed; and after employment in many official, particularly diplomatic, capacities, we find him at the age of forty-seven at the head of the Prussian state, the right hand man of the present Emperor's grandfather, William I., in the year of grace 1862. From this time on his movements became of world-wide interest; no one cared any longer what this, that, or the other political group might say or think, but all tried to find out who talked with Bismarck, what the Chancellor said, or at least whether he frowned or smiled.

In Germany at last there was found one man who had not only the knowledge of the statesman, but what was far more needful, the courage to make that knowledge effective. Since the great Frederick no King had come to the throne whose want of courage had not been conspicuous, nor did any of them long keep a Prime Minister who differed from themselves in this respect. Stein might have made Elsass a German province in 1814 had Frederick William III. been possessed of courage enough to follow his advice, but what a weak King failed to do then was gloriously accomplished by his son in 1871, a son whose glory it will ever be to have kept at his side for a full quarter of a century so courageous a servant as Bismarck.

Courage is of different kinds, as we know. The courage that enables one man to fight a battle is not always great enough to sustain him in retreating after defeat. One man dies because he has not the courage to live; his neighbor lives because he is afraid to die. The courage that sustained Washington at Valley Forge was of an order inferior to that which made him at a later day strongly condemn those who sought to make him king. Bismarck's courage manifested itself in a way that would have made cowards of Washington, if not Cromwell.

The Parliament of 1862 insisted upon their right to control expenditure, Bismarck insisted equally upon his desire to have them do as he liked. On their side was right, on his was might; the people's representatives were sent home, and Bismarck raised taxes for his extraordinary military expenditures without the consent of that power which is particularly indicated by the constitution as the one to be consulted, namely, the Lower House.

In the following year the farce of summoning Parliament was repeated with the same result. The people insisted upon their constitutional right. The Prime Minister answered by using his might. They were again sent about their business, and not only for this year and the next, but each succeeding year down to the memorable 1866, when constitutional rules were for the moment forgotten in the universal national intoxication that followed the humiliation of Austria, and the corresponding elevation of Prussia.

At this time came two other factors calculated to reconcile Germans to Bismarck's past political misdeeds. One was an attempt upon his life, which drew to him universal personal sympathy; the other was the creation of the North German Union, with a system of popular representation and a constitution much like that under which the German Empire now works. All but severe moralists had now to confess that though Bismarck had been guilty of such violence to the constitution as would have sent an English minister to the block two hundred years ago, yet they could afford to overlook it. Bismarck had frankly asked forgiveness, they said; he had concluded a war glorious to Prussian arms; had made a peace that placed Prussia at the head of a great homogeneous German Confederacy; had arranged for a free parliament to represent this new Germany; had been attacked by an assassin—in short, if a Prussian ever was to be forgiven, here was a unique opportunity for such an act of grace. And Bismarck was magnanimously forgiven by the people whom he had wronged.

THE STATUE TO EX-PRESIDENT WOOLSEY, OF YALE, TO BE ERECTED WITHIN THE UNIVERSITY GROUNDS.
[See Page 266.]

In 1870, as we all know, German troops drove the French before them from the Rhine to within the walls of Paris at such a rapid rate that people in the rear of the armies could scarce believe the despatches, so burdened were they with uninterrupted news of more prisoners, more victories, more progress toward Paris.

In the winter of that year, while German rulers leading the troops of united Germany were for the third time in the century camped about the capital of France, what more natural than the proposition to perpetuate the union that had borne such glorious fruit, and to consecrate this great battle-field by rearing here, the scene of Germany's final struggle, a German union—the German Empire. The late Emperor Frederick warmly urged this union upon the smaller states, and though we have no evidence that Bismarck was the author of the movement, he is justly entitled to the credit of having managed the diplomatic side of the question with extraordinary skill and success. No living man can claim the idea of the German Empire of to-day. It was a burning question in 1814, and the generous heart of Gneisenau nearly broke with grief when he marched his Prussians back from Paris, having failed then to bring about this splendid result. From that day on, the German patriot, whether on the shores of the Baltic or the banks of the Danube, has cherished as his political ideal a German Empire of the future, and this aspiration has never been absent from the song and poetry of the father land. If the realization has been slow, it has been not because the plain people of Germany have not longed for it, but because their interests were in the hands of selfish rulers, who jealously dreaded the ascendency of Prussia.

Bismarck made Germany in the sense that Lincoln freed our slaves. The popular cry was with them both, and they recognized the justice of the call.

Would that Bismarck could stand comparison with our great President in more respects than this!

II.

We now come upon the same Bismarck in a new rôle, one so different from that in which he has played before that his best friend might hesitate to pronounce upon the likeness. We have seen him developing from the country Tory to the head of the state. He was the betrayer of his country's liberties for four years; and then, after what passed for genuine repentance, we discover that circumstances of the most opportune kind have caused him to be regarded by all Germans, regardless of party, not only as the savior of his country, but the champion of civil liberty and constitutional privilege. Party lines were for the time obliterated. To be a Prussian was to be Bismarckian, for to be Bismarckian was to be a patriot. The converse was then recognized as equally true, that to be opposed to Bismarck was to be unpatriotic. In these later days honorable and able politicians have disagreed with Bismarck without losing a whit of their right to be called patriots. The late Chancellor, however, has never altered the definition current in 1871 that no patriot can be against him; his enemies, therefore, can only be those of his country. On this theory he has consistently acted, and has not hesitated to emphasize this doctrine by permitting petty persecution against such as have seen fit to vote against his bills.
